### **George, Henry** (1839–1897) *printer, editor, writer*

Henry George, economist, journalist, and reformer, was born on September 2, 1839, in Philadelphia, Pennsylvania, the son of Richard Samuel Henry George and Catherine Pratt Vallance. Following a brief rudimentary education, George clerked in a store and then shipped out to Australia and India. He returned to Philadelphia and learned to set type. In 1858 George decided to seek his fortune in San Francisco, where he worked as a printer and writer for various newspapers in the city. He also joined five other printers in the publication of the *Evening Journal* and worked for four years, hoping to make it competitive with San Francisco's other newspapers. George married Annie Corsina Fox in 1861 and together they had four children. The *Evening Journal*, however, did not work out. George lost everything he had invested in the project, and he endured poverty to the point that by 1865 he actually begged in the streets.

His luck changed in 1866 when he landed a job at the San Francisco *Times* as a printer. He also served on the paper's editorial staff before becoming its managing editor. In October 1868 George traveled to New York City on newspaper business and was struck by the great disparity between wealth and poverty in America and began his search for its root cause.

Within a few years George believed he had found the answer. The monopolization of land and natural resources caused the great divide between the rich and the poor. In 1871 he published *Our Land and Land Policy*, which advanced the idea that land formed the basis of wealth in

American society and that economic inequality stemmed from the ability of a few to profit from rising land values. Eight years later George published *Progress and Poverty*, in which he argued that rising land values made owners rich simply because of an increased demand for living and working space. This demand was especially acute in the nation's cities. Since the rise in property values was caused by the increased market demand rather than by owners' improvements, it represented an "unearned increment" that George argued should be taxed. His solution—calling for replacing all taxes with a "single tax" on the increment—attracted many supporters, and single-tax clubs were organized throughout the United States.

In August 1880 George moved to New York, where he lectured and contributed to various magazines. The following year, George published *The Irish Land Question* and became a correspondent for the *Irish World and American Industrial Liberator*. He made two trips to the British Isles, lecturing, writing, and meeting with leaders of the Irish Land League and British Radical Liberals. His reports on Ireland made him enormously popular in New York among the Irish and with the supporters of the Central Labor Union.

With the support of organized labor, George ran for mayor of New York City in 1886. Although the Democrat Abram S. Hewitt was elected with 90,552 votes, George finished a surprising second ahead of the Republican candidate Theodore Roosevelt. George received 60,110 votes. In 1887 he unsuccessfully ran for the office of secretary of state under the banner of the Union Labor Party. Following several years of intense lecturing in the United States and overseas, George ran again for mayor of New York City in 1897. However, he died of a stroke on October 29, 1897, four days before the election was held.

### **Geronimo (Goyahkla)** (ca. 1823–1909) *leader in the Apache War*

A renowned Chiricahua Apache warrior, Goyahkla (One Who Yawns) was most likely born along the upper stretches of the Gila River in what is modern-day Arizona. Over time he became known by the Spanish name of Geronimo, which was given to him following a successful charge he led against Mexican infantry. During his youth Geronimo experienced a period of relative peace with both the Mexican and American governments. He began traveling with the

**Gibbs, Josiah Willard** (1839–1903) *physicist*

Born in New Haven, Connecticut, on February 11, 1839, Willard Gibbs, an outstanding physicist, was the son of a distinguished philologist and Yale professor of sacred literature. The boy's interests, however, ran to technology and mathematics. Gibbs entered the Sheffield Scientific School at Yale in 1858, earning the nation's second Ph.D. in science (or first in engineering) with a thesis on gear design. After patenting a railroad-car brake, Gibbs spent the years 1866–69 studying mathematics and physics in Paris, Berlin, and Heidelberg. In 1871 he was appointed professor of mathematical physics at Yale College. For nine years the position carried no salary, but Gibbs, a lifelong bachelor with simple needs who lived with his sister's family, got by somehow. In 1873 he turned down a paying job at Bowdoin College. What mattered to him was his complete freedom at Yale to teach what and when he wanted in three or four lectures a week to one or two students. His interest in engineering problems turned him toward thermodynamics in 1872, but he went far beyond the merely practical. The half-dozen years that followed were the most brilliantly and intensely creative of his illustrious career.

Gibbs's great work in thermodynamics began with two relatively short papers on plane and solid graphical representations, published in the Connecticut Academy of Arts and Sciences's *Transactions* in 1873. They were masterful and illuminating. The great Scottish physicist James Clerk Maxwell was entranced by them, and his enthusiastic public notice initiated Gibbs's rise to fame in international scientific circles (though not among the public at large). Gibbs's truly epochal paper, "On the Equilibrium of Heterogeneous Substances," appeared in *Transactions* in two parts, one of 141 pages in 1876 and another of 182 pages in 1878. No one on the Academy's publication committee could understand them, but the committee accepted them anyway on faith in Gibbs. Maxwell immediately grasped their importance and spread the word. Gibbs himself sent copies to nearly all of the world's mathematicians, astronomers, physicists, and chemists likely to appreciate them, 507 in all, including some in India, Brazil, China, and Japan. In America, Henry Rowland and Gibbs quickly recognized the importance of the work. On its strength, Willard Gibbs was elected to the National Academy of Sciences in 1879 and offered a Johns Hopkins professorship at \$3,000 in 1880. Yale held him, however, on the basis of sentiment, loyalty, and—at last—a \$2,000 salary.

The famous "equilibrium" paper, unlike the first two, was almost entirely analytical rather than graphical in its approach. Fundamental yet strikingly original, powerfully and flawlessly logical, it formed a completed whole from which most subsequent developments in the broad fields it covered derived naturally and inevitably. From its prime equation, which produced the theory of chemical equi-

librium, could be deduced all the thermal, mechanical, and chemical properties of a complex system. It virtually engendered the field of physical chemistry. Its celebrated "phase rule" yielded manifold applications in metallurgy, mineralogy, and petrology, as well as in theoretical chemistry. Another segment of the paper played a large role in the electrochemical industry. The paper's contributions to an understanding of entropy have shaped ideas of the universe and its future. Gibbs's very methods were so fundamental and so logically irrefutable that they survived the revolution in 20th-century physics and continued to generate ideas and solutions even in quantum mechanics. Gibbs died in New Haven on April 28, 1903.

—Robert V. Bruce

**Gibbs, Wolcott** (1822–1908) *chemist*

A "pioneer" chemist, Oliver Wolcott Gibbs was born in New York City on February 21, 1822. His maternal grandfather, for whom he was named, was secretary of the Treasury under George Washington and John Adams, and his father was a mineralogist and horticulturalist. Gibbs grew up near Astoria, Queens; Boston; and Newport, Rhode Island, and entered Columbia College in 1837. When a junior, he made his first original scientific contribution, when he published a paper advocating the use of carbon electrodes in a galvanic battery. After his graduation in 1841 Gibbs assisted Robert Hare, professor of chemistry at the University of Pennsylvania. Then, hoping to teach chemistry in a medical school, he earned an M.D. in 1845 from Columbia's College of Physicians and Surgeons. Over the next three years Gibbs studied chemistry in Berlin and Giessen, Germany, and in Paris, France.

An exceptionally well-trained chemist, Gibbs, upon his return to the United States, taught at the College of Physicians and Surgeons for a year. In 1849 he became professor of chemistry at New York's Free Academy (now City College of the City University of New York), where he taught elementary chemistry. In 1853 he married Josephine Mauran; they had no children. As associate editor of the *American Journal of Arts and Sciences* (1851–73), he abstracted papers of foreign investigators and kept abreast of developments in chemistry. In 1856 he produced, with Frederick A. Genth, the ground-breaking *Researches on the Ammonia-Cobalt Bases*. It was a painstakingly difficult, time-consuming analysis, differentiating 35 salts of four cobalt-ammine series. By sensing the complex interrelationship of these compounds, his work pointed the way for future investigators. Excited and rewarded by their

research, Gibbs and Genth invited “the attention of chemists to a class of salts which for beauty of form and color, and for abstract theoretical interest, are almost unequalled either among organic or inorganic compounds.”

Although Gibbs was primarily a teacher and research chemist, alert patients with difficult medical problems sought his opinion. For example, in 1861 he recommended that Virginia Woodbury Fox have surgery by James Marion Sims, the leading gynecologist of the day. During the Civil War, Gibbs gave his services to the U.S. Sanitary Commission, which supplemented the army’s inadequate care for its wounded and sick soldiers. During the war Gibbs also found time to publish three articles in the *American Journal of Arts and Sciences* (1861–64), proposing two methods of separating the different platinum metals, which further demonstrated his prowess as an analytic chemist.

Harvard University appointed Gibbs in 1863 as Rumford Professor of the Application of Science to Useful Arts and that same year placed him in charge of the chemistry laboratory at the Lawrence Scientific School, where he remained until 1871. In that laboratory he introduced teaching methods he had learned in Germany and instructed advanced students (often one on one) by engaging in meaningful research. In 1864, for example, Gibbs, who is called the father of electrogravimetry, perfected the method of utilizing electrolysis to determine by weight both copper and nickel. He also invented laboratory instruments, including a ring burner and a glass and sand filter, which was a prototype of crucibles developed by two of his assistants.

In 1871, over the protest of Gibbs, President CHARLES WILLIAM ELIOT (also a chemist) combined the Lawrence Scientific School with Harvard College. With his laboratory becoming part of the college laboratory Gibbs’s tasks were multiplied, and he was required to teach elementary chemistry. In addition, he was placed in the Physics Department, where he taught courses on light and heat and lectured on spectroscopy and thermodynamics. Although he continued to research in his makeshift Cambridge laboratory, Gibbs missed his advanced students, and his productivity suffered. Nevertheless, he began research in 1877, in his small, private laboratory on more than 50 complex inorganic acids.

Gibbs retired in 1887 and moved to Newport, where he set up a more elaborate laboratory than the one he had in Cambridge. There he continued to research with hired assistants and to tend his garden. Although most of his work had been in inorganic chemistry, Gibbs combined his medical and chemical interests in studies of the physiological effects of isomeric (having the same composition but differing in structure) organic compounds on animals.

Since he neither wrote books nor delivered popular lectures, Gibbs is relatively unknown outside the scientific community. Within it, however, he had an international reputation and was showered with honors. He was president

of both the National Academy of Sciences (1895–1900) and the American Association for the Advancement of Science (1897). He died in Newport on December 9, 1908.

### *Gilded Age: A Tale of Today, The* (1873)

This novel by MARK TWAIN (Samuel Langhorne Clemens) and Charles Dudley Warner gave its name to an era. Thanks in part to *The Gilded Age*, American society in the final third of the 19th century would forever be known for its unbridled greed, unmerited fortunes, tasteless opulence, cynical politics, and corrupt governance. Working from recent headlines (the scandals of the Grant administration, the stealings of Boss Tweed of TAMMANY HALL, and revelations that Senator Samuel Pomeroy of Kansas had tried to purchase his reelection by bribing state legislators), the authors employed satire, melodrama, parody, and reportage to depict an age of excess. Although not a major contribution to American literature, *The Gilded Age* is in a class with two other contemporary critiques of American politics, Walt Whitman’s *Democratic Vistas* (1871) and HENRY ADAMS’s *Democracy* (1880).

The political aspect of the novel hinges on three land schemes, two of which depend upon government largess and influence peddling. The other, by way of contrast, comes down to honest dealing, hard work, sacrifice, and commitment. In elaborating these episodes, Twain and Warner explored the full range of Gilded Age venality, including financial finagling, railroad and mining scams, and the buying and selling of legislation.

The authors offered little hope that the “best people” would put an end to the greed and corruption, or even rise above it. Twain and Warner identified three distinct aristocracies: The Antiques are “cultivated, high-bred old families” whose ancestors had been “great in the nation’s councils and its wars from the birth of the republic downward.” In the world of *The Gilded Age*, the Antiques still enjoyed social prominence but no longer set the tone for politics. (Henry Adams personified this class in the real world of Washington, but he has no significant counterpart in *The Gilded Age*.) The Parvenus are newly rich, ostentatious, opportunistic, and amoral. They call the tune in Washington, New York, and wherever else power and money can generate more power and money. Twain and Warner find much to admire in the third group of aris-

tocrats, the Middle Group. These are people of learning, taste, and honor. In *The Gilded Age*, they are the Boltons of Philadelphia and the Montagues of New England. But for all their merits, such people are no match for the Parvenus. Sharp operators regularly dupe the generous but gullible Mr. Bolton. For his part, the high-minded Squire Montague maintains an admirable household where “there was always so much talk . . . of the news of the day, of the new books and of authors, of Boston radicalism and New York civilization, and the virtue of Congress.” But for all their fine talk and head shaking, men like the good Squire remain aloof from the unseemly nexus of money and power and so have no positive effect on public affairs.

Civic life may have been irredeemable, but individual goodness is not entirely absent from *The Gilded Age*. Readers could take heart from the spontaneous kindness of Squire and Mrs. Hawkins, who take in a distraught small boy whose mother has recently died and a young girl who has lost her parents in a steamboat accident; from Ruth Bolton’s attempt to elevate her gender and serve humanity by studying medicine; from Alice Montague’s selfless devotion to friends; and from Philip Sterling’s dedication and honesty.

Although known principally for its satirical treatment of politics, *The Gilded Age* contains other elements, including stories of passion and unrequited love, a melodramatic murder complete with sensational trial (all the better to ridicule the judiciary), and a disastrous steamboat race. Twain and Warner occasionally rely on Dickensian touches, not least of which is the novel’s most interesting and amusing character, the Micawber-like Colonel Sellers, whose grandiose but unfounded (and unfunded) schemes are usually, but not always, harmless.

*The Gilded Age* is set in Tennessee, Missouri, Philadelphia, New York City, New England, and the nation’s capital. Tennessee is a place of backwardness and false hopes, while Missouri is a virgin land sullied by rapacious financial interests. Philadelphia is grand and almost good; New York is grand and bad. New England is high-minded, cultured, and venerable. As for Washington, it is not the city of hallowed traditions and monuments, but a den of wheeler-dealers whose brazenness would make the most disreputable frontier boomtown seem prim by comparison.

The response to *The Gilded Age* was mixed. It sold well, but critics were divided. Some newspapers that were allied with the persons and interests that Twain and Warner had excoriated accused the authors of seeking to profit from the misfortune of others. Neutral critics found it noteworthy that two popular humorists had turned to satire. A few were disappointed in the results; others were delighted by the authors’ new seriousness.

Whatever its strengths and weaknesses, *The Gilded Age* is noteworthy as Mark Twain’s first attempt at writing

a novel, albeit in collaboration. That Charles Dudley Warner was an easterner and Twain a westerner may account for the fault line between the regions in their story. In *The Gilded Age* the East is urban, sophisticated, and (except for people like the Montagues and Boltons) corrupt; the West is rural, simple, and innocent—ripe for exploitation. Even the shameless self-promoting Missourian, Colonel Sellers, seems a mere bumpkin compared to the oily lobbyists and politicians of Washington. In general, Dudley Warner developed the eastern scenes and characters (Philip Sterling, the Boltons, and the Montagues), while Colonel Sellers, the Hawkins family, and the Missouri setting are unmistakably Twain’s work. For the story line about the Hawkins’s land holdings, Twain tapped the experience of his wife’s family, which had inherited undeveloped land in Tennessee. For the book’s delineation of congressional skullduggery, Twain drew on his own brief and unsatisfactory experience in Washington as personal secretary to Senator William Stewart of Nevada. Current events inspired other characters and incidents. Senator Samuel Pomeroy was the model for the sanctimonious and corrupt Senator Dilworthy. The charming but doomed Laura Hawkins is the fictional counterpart of Mrs. Laura Fair, the defendant in a much-publicized murder trial.

*The Gilded Age* collaboration extended beyond Twain and Warner. The novel features unique chapter headings consisting of arcane mottoes in a variety of foreign languages. The noted scholar J. Hammond Trumbull suggested the mottoes and provided translations at the end of the narrative. In addition, the book included illustrations by Augustus Hoppin. (Political cartoonist THOMAS NAST, Boss Tweed’s arch-enemy, declined the commission.)

*The Gilded Age* had a complex afterlife. In 1874 playwright George Densmore staged an unauthorized adaptation of the novel. After Twain sued Densmore, the two litigants collaborated on a reworked version that was produced in New York as *The Gilded Age*. Subsequently, Twain, this time with Charles Dudley Warner, created yet another stage adaptation, this time calling it *Colonel Sellers*. Twain and WILLIAM DEAN HOWELLS wrote a sequel that they called *The American Claimant* (1887). The New York production flopped, but Twain published a novelization in 1892. Compared with *The Gilded Age*, it seems less a sequel than an afterthought.

**Gilder, Richard Watson** (1844–1909) *editor, poet*

The Gilded Age's preeminent magazine editor and a minor poet, Richard W. Gilder was born on February 8, 1844, in Bordentown, New Jersey. He was educated at girl's schools, which his father headed in Flushing and Yonkers, New York. He read widely and was early fascinated by newspapers. At the age of 12, he frequented the office of the Flushing *Long Island Times* and even set type for that paper. In 1861, with the outbreak of the Civil War, Gilder's father, who was a Methodist minister, became an army chaplain, and the family returned to Bordentown, where Gilder briefly studied law. After his father died from smallpox in 1864, Gilder secured a job as paymaster on the Camden & Amboy Railroad. In Newark, he met Ellen Clementine Howarth, whose poems he edited with an introduction in 1868, launching his career in literature.

After working briefly on Newark newspapers, Gilder, in 1869, was hired by Charles Scribner, the publisher, to assist in editing *Hours at Home*, a magazine that was designed to sell Scribner's books. Within a few months Gilder became its editor. In November 1870 Scribner replaced *Hours at Home* with *Scribner's Monthly Magazine*, hired Josiah Gilbert Holland as its editor and made Gilder his assistant. With Holland insisting on editorial independence, disdaining "harmless and inoffensive literary pap," and proposing to "boldly lead in the denunciation of social and political abuses," *Scribner's* soon joined *Harper's* and the *Atlantic* as a leading monthly literary magazine. Gilder was *Scribner's* managing editor, wrote a monthly column (*The Old Cabinet*), and was responsible for illustrations, which were in advance of its rivals. The author HELEN HUNT JACKSON introduced him in 1872 to Helena de Kay, an art student at Cooper Union, for whom he wrote and published love sonnets in *Scribner's*. They married on June 3, 1874, and their home became a gathering place for such artists as JOHN LA FARGE and AUGUSTUS SAINT-GAUDENS; architects like STANFORD WHITE; writers such as Walt Whitman and MARK TWAIN; actors like JOSEPH JEFFERSON III; and politicians, among them GROVER CLEVELAND and Theodore Roosevelt. Their daughter Rosamond, one of two children, became a distinguished THEATER critic.

In November 1881 *Scribner's* was renamed the *Century Monthly Magazine*, its connection with the publishing house was severed, and Gilder was named its editor.

Under his leadership the *Century* distanced its competitors, using primarily history and biography. A serial treatment of the life of Peter the Great, run in *Scribner's* last year, encouraged Gilder to publish in 13 issues Edward Eggleston's *A History of Life in the Thirteen Colonies*. Its success prompted Gilder to embark on his greatest project, *Battles and Leaders of the Civil War*, which ran from 1884 to 1889 and doubled circulation from 125,000 to 250,000. These eyewitness accounts by Union and Confederate participants, from privates to generals (including Ulysses S. Grant, Joseph E. Johnston, William T. Sherman, George B. McClellan, as well as Admiral David Dixon Porter) were fascinating and valuable. Assuming success would breed success, Gilder serialized an abridged version of John G. Nicolay and John Hay's 10-volume *Abraham Lincoln: A History* but, while adding prestige, lost the *Century* readers. A third great nonfiction series, *Siberia and the Exile System*, by George Kennan, graphically illustrated by George A. Frost, exposed the appalling conditions suffered by political prisoners in czarist Russia. The series had an enormous influence in America, Europe, and liberal circles in Russia, where it was surreptitiously circulated.

The quality of the *Century's* woodcut engravings magnified the impact of its articles. Its engravers, of whom perhaps Timothy Cole was the best, did justice to the outstanding artists Gilder recruited. Financed by the *Century*, Eggleston discovered in the British Museum John White's 16th-century drawings of Virginia Native people. WINSLOW HOMER reworked 15 of his wartime drawings for the *Battles and Leaders* series, which also drew upon the photographs of Mathew Brady. Other outstanding illustrations included Charles Dana Gibson's fashionable Gibson Girl, Frederic Remington's cavalymen and cowboys, and Joseph Pennell's New York skyscrapers and French cathedrals.

Gilder was the arbiter of the *Century's* taste in fiction. While not as prudish as Holland had been, Gilder was in the genteel tradition. He eliminated slang, vulgarity, and sex in what he published. On the other hand, he ran Whitman's poetry, tolerated a degree of realism if employed to uplift the reader, and published the notable realists WILLIAM DEAN HOWELLS, HENRY JAMES, and Twain. He rejected STEPHEN CRANE's *Maggie: A Girl of the Streets* (1893), thinking it too cruel. A housing reformer, Gilder knew the slums and acknowledged to Crane the accuracy of *Maggie*. Gilder was chairman of the 1894 New York Tenement Housing Committee and a consistent opponent of Tammany Hall. He died on November 18, 1909.

**Gilman, Daniel Coit** (1831–1908) *higher education reformer, president of Johns Hopkins University*

A university president renowned for his promotion of graduate studies, Daniel C. Gilman was born in Norwich, Connecticut, on July 6, 1831. He attended Norwich Academy and entered Yale College in 1848, where he met ANDREW DICKSON WHITE, who became his lifelong friend. After graduation in 1852 Gilman studied geography for a year at Harvard, and in late 1853 he and White were appointed unpaid attaches to the new minister to Russia, Thomas Hart Seymour, the former governor of Connecticut. Gilman remained in Europe for two years, traveling, observing, and being inspired by universities in Germany, France, and Britain.

Shortly after his return to the United States, Gilman went back to Yale. In 1856 he started as assistant director of the library, but he also helped draw up plans for the reorganization of Yale's Sheffield Scientific School and was employed to raise funds for that school. On December 4, 1861, he married Mary Ketcham; they had two daughters. By 1862 Gilman had become director of Yale's library, and in 1863 he was also named professor of physical geography in the Sheffield school. Limited funds made his library position frustrating. Unable to develop a library that would facilitate research, he resigned in 1865 and concentrated his efforts on the Sheffield Scientific School. To raise funds for it he promoted the virtues of a science education and gained a broad perspective for the school's programs. From 1866 to 1872 he was secretary of the Sheffield school's governing board and was largely responsible for the school's success. But beginning in 1871 Noah Porter, the new president of Yale, de-emphasized the graduate programs, and the Sheffield school suffered. Porter's changes on top of the severe personal blow Gilman received when his wife died in 1869 left him open to a new position.

Gilman's success at the Sheffield Scientific School led to his appointment in 1872 as president of the University of California at Berkeley. A mere 23 years after the gold rush, Gilman envisioned a university with an ambitious graduate program, tailored for the people of California. His dream was prophetic, but it would take generations to achieve. Slow progress toward his goal made Gilman restless. He let his friend White, who had recently launched Cornell University and was its first president, know in 1874 that he wanted to move, and by the end of the year he had an offer.

Johns Hopkins, a wealthy Quaker, through his will endowed, with \$3.5 million, a hospital for Baltimore and the same amount for a university. The Hopkins trustees, in October 1874, offered Gilman the presidency of the yet-unfounded Johns Hopkins University; he accepted and became its president in January 1875. Given his observations in Europe, his work at Yale, and his dreams

at Berkeley, Gilman was equipped to build a modern university. He envisioned a strong graduate program and prescribed the requirements, with the emphasis on research, for the Ph.D. degree. These requirements were soon adopted with minor changes by universities throughout the nation. In recruiting an outstanding faculty, Gilman consulted widely in the United States and Europe and hired people such as RICHARD THEODORE ELY in 1881, who led an assault on classical economic dogmas. Of equal importance Gilman instituted a fellowship program that attracted promising students throughout the country, including JOSIAH ROYCE and FREDERICK JACKSON TURNER. To avoid the clash between graduate programs in the sciences and social sciences with traditional undergraduate programs rooted in the classics, Gilman devised a group system of studies, whose courses, including the classics, would complement on an undergraduate level the graduate program. Gilman chose Thomas Huxley, the agnostic apostle of EVOLUTION, to deliver the Johns Hopkins University inaugural address in 1876. His presence and the absence of a prayer gave notice that Johns Hopkins would be secular and progressive. With the university under way, Gilman, in 1877, married Elisabeth Dwight Woolsey, the daughter of Theodore Dwight Woolsey, Porter's predecessor as president of Yale.

Gilman also participated in the establishment of the Hopkins Hospital, which was delayed until 1889. He prevented the hospital from teaching medicine by emphasizing that Johns Hopkins, its creator, intended that the medical school be a part of the university. Gilman's solution that the university teach MEDICINE and the hospital care for the sick was accepted. If conflict should arise, the boards could work out differences. The Hopkins Medical School, with its legendary faculty (including Sir William Osler and William H. Welch), was on the cutting edge of medical science from its inception. The medical school became the premier graduate program among many superb programs at Hopkins, and together they account for Gilman's renown as "the patron saint of the American graduate school."

In 1902 Gilman retired as president of Johns Hopkins, and on ANDREW CARNEGIE's insistence became president of the Carnegie Institution in Washington, D.C. It was designed to encourage research, and Gilman thought it should be tied to university graduate programs. Gilman remained only two years in that position. Although the Carnegie Institution promoted scientific research, it did not become associated with graduate programs. Gilman also worked closely with former president RUTHERFORD B. HAYES on the Slater Fund for educating black students and became president of the American Social Science Association in 1879. He died on October 13, 1908, in Norwich.

**Further reading:** Francesco Cordasco, *The Shaping of American Graduate Education: Daniel Coit Gilman and the Protean Ph.D.* (Totowa, N.J.: Rowman & Littlefield, 1973); Abraham Flexner, *Daniel Coit Gilman: Creator of the American Type of University* (New York: Harcourt, Brace, 1946).

**Gladden, Washington** (1836–1918) *leader of Social Gospel movement*

Born in Pottsgrove, Pennsylvania, on February 11, 1836, Washington Gladden was a notable early voice of the SOCIAL GOSPEL movement. He rejected the orthodox Calvinism of his youth and believed that salvation was achieved not through doctrinal beliefs but by accepting the love of God and living it every day. Beginning in 1860 Gladden ministered to various Congregational churches in New York and Massachusetts, but especially in Columbus, Ohio, from 1883–1918.

Gladden's emphasis on the commandment of Jesus to love God and one's neighbor led him to confront the social, economic, and political problems engendered by rapid industrialization and urbanization. With his conviction that the churches had to do more than target personal sin and had to help solve social problems, Gladden took up the moral torch carried by the abolitionists and became the first voice of what became known as the Social Gospel. Aware that workers were not getting their fair share of profits, Gladden was an early advocate of labor unions. At first he thought strikes were counterproductive, but in time the intransigence of capitalists made him more militant. He was a firm believer in government regulation of industry and ownership of utilities, but he opposed SOCIALISM as too bureaucratic and too stifling of individual enterprise. He was an urban reformer favoring municipal home rule and worked to establish social services and cultural opportunities in Columbus. Two of his books, *Social Salvation* (1902) and *The Church and Modern Life* (1908), effectively sum up the Social Gospel. Gladden supported virtually every reform encompassed by PROGRESSIVISM IN THE 1890s and early 20th century, and his death on July 2, 1918, during World War I, quite coincidentally marked the demise of both the Progressive Era and the vogue of the Social Gospel.

—W. Frederick Wooden

**Godkin, Edwin Lawrence** (1831–1902) *journalist*

An influential newspaper man, Edwin Godkin established new standards for American journalism by using his sharp wit and stronger pen in support of political reform. He was

born in Ireland on October 2, 1831, and was the eldest child of Reverend James and Sarah Lawrence Godkin. Although his parents were English, Godkin's father allied himself early on with home rule for Ireland and was a prolific controversial writer, a dissenting clergyman who often served as a correspondent for the *London Times*.

Edwin was sickly as a child, but he was sent to England, near Leeds, for his schooling. He returned to Ireland to earn an undergraduate degree from Queen's College, Belfast, in 1851. Shortly after graduation, Godkin decided to study law in London, but anxious to utilize his training in history, economics, and political theory, he abandoned law for political journalism. He joined the staff of John Cassell's radical magazine, *The Workingmen's Friend*, and supported the recent Hungarian revolution in a series of articles that Cassell in 1853 published in book form as *The History of Hungary and the Magyars*. In 1854 he traveled to Hungary and was warmly received by revolutionaries. For two years (1853–55) he served as a correspondent for the *London Daily News* during the Crimean War, gaining a grasp of military theory and a hatred of war that often showed in his scathing language about it throughout his life.

Godkin immigrated to the United States in 1856 and continued to send letters to the *Daily News*. A tour of the South confirmed his antislavery views, and during the Civil War he edited the *Sanitary Commission Bulletin* as well as contributed to the *New York Times*. After the war Godkin, with his transatlantic reputation as a journalist and writer, accepted a position as the first editor (1865–1900) of the *NATION*, a weekly magazine. Although its founders wanted *The Nation* to improve the condition of former slaves, Godkin soon ignored them and denounced as corrupt the black, carpetbagger, and Reconstruction governments in the South. Consistent with his 19th-century liberalism, Godkin believed in economic individualism and laissez-faire and opposed any government involvement in social causes. No longer "the workingmen's friend," he opposed labor unions. Under his reign *The Nation*, with its stinging prose, assailed political corruption in President Ulysses S. Grant's Republican administration and in New York City under the control of the Democratic party's Tammany Hall. He was an ardent advocate of CIVIL SERVICE REFORM and, in keeping with his laissez-faire philosophy, supported a tariff to raise revenue but not to protect industry and also favored a currency based on the gold standard.

In 1881 Godkin accepted a larger journalistic opportunity as editor of a daily newspaper, the *New York Evening Post*. Editing both publications, Godkin combined selected editorial content from *The Nation* with the *Evening Post* and handled large issues independently without favoring any political party. Because of his broad interest in history, economics, and political theory, his influence upon the press and public opinion was strong and persuasive.

Although his publications never had more than 35,000 subscribers, he was read by the clergy, lawyers, and college professors, who disseminated his views to wider publics. Godkin was often considered a “voice of reason.” In 1898, for example, when other newspapers were urging the United States to go to war with Spain, Godkin was stalwart in his belief that the war would be wrong. The war, which did occur, added to the growing pessimism he expressed in three books published in the 1890s: *Reflections and Comments* (1895), *Problems of Modern Democracy* (1896), and *Unforeseen Tendencies of Democracy* (1898).

Always writing with indignation and a strong affinity for prosaic language, Godkin cared more for the editorial than the news pages of his publications. He often said he did not try to compete with other newspapers of the day but chose instead to be known for opinion and activist reform. Ill health forced Godkin to step down from his post in 1900, but he continued to write articles for the *North American Review*, the *Atlantic Monthly*, and *Scribner's* among other magazines. He died in Brixham, England, on May 21, 1902.

**Gompers, Samuel** (1850–1924) *union leader*

Born on January 27, 1850, in London, England, labor leader Samuel Gompers attended school for four years before getting a job to supplement his family's income. He tried shoemaking for a short time before deciding to become a cigarmaker. In 1863 Gompers moved with his family to America, where they settled in New York City. Although he attended lectures at the Cooper Union, his greatest exposure to ideas was in the workplace; cigar makers broke the monotony of their jobs by hiring someone to read to them while working. A fellow worker, Ferdinand Laurel, introduced him to SOCIALISM but cautioned him to avoid the trap of ideology. Gompers carried this admonition with him all his life, consistently measuring issues by how they would affect the union and not against an ideological orthodoxy.

Samuel Gompers (Dover Publications)

A union member in England, Gompers joined a New York local of the Cigarmakers International in America, but he was an apathetic member until the early 1870s. The cigar mold, which allowed nonskilled workers to form the filler or interior of the cigar, was being adopted in New York, and skilled cigarmakers were losing their jobs. Initially, the union did not organize the unskilled workers, with the result that by 1872 Gompers's local union had less than 50 members.

Gompers and a friend, Adolph Strasser, began to rebuild the union by accepting the mold (arguing that it was efficient and inevitable) and by recruiting the unskilled cigarmakers. By 1875 they recruited 245 members, making it the largest union of cigarmakers in the United States. Two years later, however, the union suffered a major defeat. Manufacturers switched production from shops to tenements, where immigrant families made cigars on a contract basis under deplorable conditions. In 1877 the exploited and unorganized tenement cigarmakers went on strike. Against the wishes of their leaders, the local's membership voted to support them. The strike failed after exhausting the union's treasury, but Gompers learned from the experience.

Also in 1877 Strasser and Gompers gained control of the Cigarmakers International and began a reorganization based on the lessons of the recent strike and upon Gompers's experience with English trade unions. Only workers in the trade could become members. Membership carried sick and death benefits. Central officers were supreme, and all strikes

required their prior approval. If necessary, the union would break unauthorized walkouts. The union charged high dues to pay the benefits and build a sizable reserve fund to cushion economic recessions. Other trade unions adopted this successful model and recognized their debt to Gompers in 1886 by electing him president of the AMERICAN FEDERATION OF LABOR (AFL), a position he held, with the exception of one year, until his death on December 13, 1924.

Gompers used his presidency of the AFL as a pulpit for expounding his philosophy of wage-conscious unionism. Labor unions, he argued, should only be concerned with the economic conditions of their members, not with creating utopias, forming political parties, organizing producers cooperatives, or reforming society. Collective bargaining, strikes, and boycotts conducted by businesslike unions were the only means of improving wages and working conditions. The AFL made no attempt to organize unskilled workers, but Gompers argued that unorganized unskilled workers often benefitted from the better wages, hours, and working conditions won by union labor.

### **Gould, Jay** (1836–1892) *businessman, financier*

Jay Gould was the most notorious financier of the Gilded age. Born Jason Gould on May 27, 1836, in Roxbury, New York—the son of Mary More and John Gould, a farmer and storekeeper—Jay Gould studied in local schools before going to work as a clerk in his father's store at age 16. An unusually serious and ambitious youth, he invented a mousetrap before he was out of school, and by the time he was 17 he had taught himself surveying and formed his own company to practice it. He made maps, which he sold at a reasonable price, and at the age of 19 wrote a 426-page history of Delaware County that a century and a half later was still recognized as the definitive work on the early history of his region of New York. From 1856 to 1859 Gould and partners operated a tannery in Pennsylvania, but disagreements followed by the suicide of one of the partners led Gould to abandon tanning and take up finance on New York's Wall Street.

Gould quickly mastered the intricacies of finance and was phenomenally successful. Arriving at Wall Street with almost nothing to invest, according to a contemporary source, he made himself a millionaire long before the end of the Civil War. In 1863 he married Helen Day Miller, with whom he had six children and lived in exemplary domestic harmony until her death in 1889. He loved books and flowers, especially orchids.

Gould had a particular passion for RAILROADS. In 1867 he joined Jim Fisk and Daniel Drew on the board of

directors of the Erie Railroad and frustrated the monopolistic attempt by CORNELIUS VANDERBILT of the New York Central Railroad to control it. But in doing so Gould and Fisk allied themselves with the spectacularly corrupt TWEED RING, issued \$8 million in watered stock for the Erie in defiance of a restraining order, and spent a reported \$1 million bribing the New York legislature to legalize the action. In 1868 Gould became president and treasurer of the Erie and had grand schemes for its expansion, but the Tweed Ring was destroyed, Fisk was murdered, and Gould in 1872 was ousted from control of the Erie. In 1869, in a move linked to his ambitious plans for the Erie, Gould (with Fisk) attempted to corner the gold market on “Black Friday,” precipitating a Wall Street panic and reputedly sharing profits of \$11 million with Fisk.

Gould's participation in the Erie War and the Black Friday scheme caused him to be reviled as a “robber baron,” but ironically his subsequent career was more constructive, more responsible, than his earlier corrupt, dishonest rise. Gould was a talented, efficient administrator and a man of vision. From 1874 to 1878 he controlled the Union Pacific Railroad, which he improved during those years. Yet he forced the Union Pacific to buy at par the Kansas Pacific, which he controlled, netting him \$10 million that he used to build a railroad empire in the Southwest, including the Missouri Pacific and the Texas & Pacific. By 1880 he controlled more than 8,000 miles of railroad, more than any other individual in the world, and in 1881 he gained control of the Western Union telegraph system and the Manhattan elevated transit system, all of which he administered very carefully. Nevertheless, when he died on December 2, 1892, he had not lived down his reputation as the most hated man in America, and he remains the most widely reviled capitalist in American history.

### **Grand Army of the Republic**

The Grand Army of the Republic (GAR) was formed after the Civil War as a fraternal organization for veterans of the Union army. It was first organized in the spring of 1866 by a group of veterans in Springfield, Illinois, led by Dr. Benjamin F. Stephenson. GAR posts were established in several states, and their first National Encampment (the GAR's version of a national convention) was held in November at

Indianapolis, Indiana. Initially, the GAR grew slowly, but between 1881 and 1882 its membership rose from approximately 87,718 to 131,900; by 1890 membership in the GAR reached 409,489, making it the largest and most powerful veterans' organization in the United States.

Although it originally avoided political involvement, the GAR became a major political force, influencing several elections with its financial support and partisan electioneering for Republican candidates. The principal goals of the GAR were to increase pensions and other benefits for veterans and their families and to remember those who died in the war. The GAR was instrumental in securing the observance of Decoration Day (currently observed as Memorial Day, commemorating all war dead) in 1868 to honor those who gave their lives for the Union during the Civil War. The GAR successfully pressed for the 1879 Pension Arrears Act, which provided for back pensions (to the date of discharge) for disabled Union veterans. In 1887 Congress passed the Dependents Pension bill, granting a pension of \$12 a month to all Union veterans suffering from any disability that prevented them from earning a living and gave the same pension to the dependent parents and widows of a deceased veteran. Although the GAR had lobbied Congress for many years to pass such a bill, President GROVER CLEVELAND vetoed it, earning for himself the enmity of the GAR. In the 1888 presidential election, the GAR supported BENJAMIN HARRISON, the Republican candidate. Harrison not only triumphed but the Republicans also carried both houses of Congress. In 1890 Congress passed and President Harrison signed the Dependents Pension Act, which embodied many of the same features of the earlier bill. The law doubled the number of pensioners from 490,000 to 966,00 and ensured that the GAR would remain a virtual wing of the Republican Party.

### grandfather clause (1895–1910)

Most AFRICAN AMERICANS were not permitted to vote in the United States until they were enfranchised in the former Confederacy by the act of March 2, 1867, and in the rest of the nation in 1870 by the Fifteenth Amendment to the U.S. Constitution. Following the end of Reconstruction, white southerners used various means to disfranchise black voters such as literacy tests, good-character requirements, and poll taxes. The grandfather clause, however, exempted impoverished and illiterate whites from these restrictions.

Beginning with South Carolina in 1895, seven states used the grandfather clause, which declared that those who voted prior to January 1, 1867, and their lineal descendants were exempt from property, educational, or tax requirements for exercising the franchise. Following South Carolina, Louisiana (1898), North Carolina (1900), Alabama (1901), Virginia (1902), Georgia (1908), and Oklahoma (1910) adopted the grandfather clause. Although the grandfather clause was applicable for a limited period (except in Oklahoma), its effect in disfranchising black voters was devastating and lasting. For example, in Louisiana the already low African-American voter registration dropped from 130,734 in 1896 to 1,324 in 1904. Apart from Oklahoma, where blacks composed only 7 percent of the population, the states that employed the grandfather clause to suppress the black vote disfranchised either a majority or a substantial minority of their citizens and created a “lily white” electorate. The percentage of blacks in those states ranged from 58 percent in South Carolina to 33 percent in North Carolina.

The permanent grandfather clause was challenged in Oklahoma after election judges denied an African American the privilege of voting. They were indicted and convicted for conspiring to deny a citizen his constitutional rights under federal statutes. The U.S. Supreme Court heard the case of *Guinn v. United States* in 1913 and decided unanimously in 1915 that the grandfather clause obviously violated the Fifteenth Amendment and struck it down. The decision, however, had little practical effect, since the grandfather clause in other states had already disfranchised African Americans and had lapsed, and the small number of blacks in Oklahoma were disfranchised by other devices.

### Great Strike of 1877

The Great Strike of 1877 was a series of spontaneous railroad strikes between July 16 and August 5 that collectively involved the largest number of people in a labor conflict in the 19th century. Four years of layoffs and wage reductions as high as 35 percent had angered railroad workers. The workers' frustration slowly boiled over when the major

Engravings of the Great Strike of 1877 (*Library of Congress*)

eastern RAILROADS announced another round of wage cuts during the early summer of 1877.

On July 16 a small group of workers on the Baltimore and Ohio Railroad (B&O) refused to move trains at Camden Junction, Maryland. Local authorities dispersed the strikers and restored traffic on the line. Two days later, however, B&O trainmen at Martinsburg, West Virginia, refused to work. Finding local authorities unable or unwilling to end the strike, management asked Governor Henry M. Mathews to send in state troops to suppress the crowd. Discovering the militia ineffective, the company persuaded Mathews to request federal troops. With some misgiving President RUTHERFORD B. HAYES accepted the governor's definition of the strike as a domestic insurrection and sent in the army to keep the peace. But by this time the strike was spreading throughout the country, stopping the flow of railroad traffic at Pittsburgh, Chicago, St. Louis, San Francisco, and many smaller cities.

Violence also escalated as unemployed men and boys joined the strikers and rioters. In Pittsburgh, for example, local elements of the state militia would not prevent the mob from looting and burning the property of the hated Pennsylvania Railroad (PRR). Authorities then ordered in the militia from Philadelphia, Pittsburgh's eastern rival. Crowds stoned the troops' train as it traveled westward. At Pittsburgh the Philadelphians fired into the crowd, killing 26 people. The angry mob forced the troopers into a roundhouse, set it on fire, and drove them out of town. In Reading, Pennsylvania, one militia company threatened to fire into another if it continued to harass strikers. Small detachments of federal troops were dispatched to Pittsburgh and elsewhere to restore order. Universally respected, the U.S. Army neither fired any shots at rioters nor were they fired upon. By August 5 most strikes were over.

The Great Strike was a traumatic experience for the American public. It was a spontaneous upheaval that smacked of European-style class warfare. Together with the recent MOLLY MAGUIRES episode, the Great Strike justified for some the notion that labor protest was sinister and un-American. As a result, states built armories in their industrial centers, and some enacted conspiracy laws that could be used against labor. But the Great Strike also made the public aware of the real grievances railroad workers had against management. The *New York Times* recognized that "beneath the vicious elements which produced the riots, the country traces evidence of hardship, of suffering, of destitution to an extent for which it was unprepared." Indeed, even railroad managers conceded that the cut in pay was more costly than an increase would have been and began restoring the wage cuts that caused the strike.

Although Hayes has been accused of breaking the Great Strike, he did not. He sent in troops only when properly requested by state and local officials, ordering them to

protect government and private property and not "to quell the strikers or run the trains" and refusing the demands of THOMAS A. SCOTT of the PRR to use the pretext of obstruction of the mails for intervention, a tactic adopted by President GROVER CLEVELAND in the 1894 PULLMAN STRIKE. Hayes, however, did enforce injunctions issued by federal courts acting as receivers for bankrupt railroads. After the Pullman Strike, the injunction was also used to protect solvent corporations and would become a powerful tool to break strikes.

Government action during the strike temporarily thrust labor into politics. In New York, Pennsylvania, and Ohio, Workingmen's Parties attracted a significant number of votes during the fall elections. In 1878 some labor leaders attended the founding convention of the GREENBACK-LABOR PARTY, which enjoyed some success that year. But despite the name, it appealed primarily to farmers and not to workingmen.

**Further reading:** Robert V. Bruce, *1877: Year of Violence* (Indianapolis: Bobbs-Merrill Company, 1959); Gerald G. Eggert, *Railroad Labor Disputes: The Beginnings of Federal Strike Policy* (Ann Arbor: University of Michigan Press, 1967).

### Greenback-Labor Party

During the crisis of the Civil War the federal government had issued \$450 million of fiat paper money (not backed by gold) called greenbacks, which depreciated in value and drove gold out of circulation. After the war the number of greenbacks was reduced to under \$400 million. While conservative banking and creditor interests applauded contraction and deflation, agrarian and many business interests were alarmed and succeeded in stopping the contraction. During the second administration of President Ulysses S. Grant (a hard-money man), the United States plunged into a serious depression following the panic of 1873. Debtor groups pressed the government to increase the number of greenbacks in circulation, while supporters of "sound money" wanted a currency based on the gold standard.

The greenback question became one of the primary points of contention in the post-Civil War period, and CONGRESS reacted inconsistently. In April 1874 Grant vetoed its bill that would have increased greenbacks to \$400 million; in June 1874 Congress placed a \$382 million ceiling on greenbacks; and in January 1875 it passed the Specie Resumption Act, calling for the reduction of greenbacks to \$300 million and their redemption with gold dollars by Jan-

uary 1, 1879. But the Specie Resumption Act also required that for every \$80 in greenbacks retired, \$100 in national bank notes had to go into circulation. However, the amount of national bank notes issued did not meet expectations, and the contraction of greenbacks stopped at \$347 million. The overall result of the legislation was to appreciate the value of greenbacks.

Reacting to the Specie Resumption Act, the advocates of greenbacks ("soft money") conferred in Cleveland and Cincinnati, Ohio; held a convention in May 1876 in Indianapolis, Indiana; and organized a National Independent (Greenback) Party. These Greenbackers—including farmers, labor reformers, and some businessmen—called for the repeal of the Specie Resumption Act and nominated for president the 85-year-old philanthropist Peter Cooper, who polled less than 1 percent of the popular vote (82,000 votes). While all Greenbackers wanted an increase in the number of greenbacks, most were not in favor of a runaway inflation but, rather, a managed currency that would better reflect the needs of the economy. Following the labor strife of the late 1870s, several workingmen's groups joined the Greenback movement. The new coalition came to be known as the Greenback-Labor Party. Thereafter, the Greenbackers not only supported currency inflation but also promoted an eight-hour workday, the creation of a government labor bureau, and the restriction of Chinese immigration. Primarily agrarian, but bolstered by labor support, the party candidates fared better in the 1878 midterm elections as

15 Greenbackers were elected to the U.S. House of Representatives and countless others to state and local offices. In 1880 the Greenback-Labor presidential candidate General James B. Weaver of Iowa gained 300,000 votes, but in the 1884 election Greenbacker Benjamin F. Butler of Massachusetts received only 175,000 votes.

By the middle 1880s the Greenback-Labor Party had all but collapsed. Subsequently, the Greenbackers joined the FREE SILVER MOVEMENT to agitate for currency expansion. Although it had only limited political success, the Greenback-Labor Party did encourage voters to act independently of the two major parties and trained some of the leaders of the PEOPLE'S PARTY (Populists).

**Half Breeds** See REPUBLICAN PARTY.

**Hall, Granville Stanley** (1844–1924) *psychologist, education reformer*

The pioneering champion of scientific psychology in the United States, G. Stanley Hall was born on February 1, 1844, in Ashfield, Massachusetts. Upon graduation from Williams College in 1867, he entered Union Theological Seminary, studied philosophy in Berlin, Germany (1869–70), and received his divinity degree from Union Theological Seminary. Deciding he would rather teach than preach, he taught philosophy and literature at Antioch College from 1872 to 1876. Next, he studied psychology under WILLIAM JAMES at Harvard, where in 1878 he earned the first Ph.D. in psychology awarded in the United States. Unable to get a professorial appointment in psychology, Hall went to Germany for laboratory training in physiological psychology. While in Berlin in 1879, he married Cornelia Fisher, an American art student. They had two children.

When Hall returned to the United States in 1880, he had already caused a stir in intellectual circles. His 1879 article published in the journal *Mind* characterized the instruction of “Philosophy in the United States” as “medieval.” Hall, however, failed to get an appointment in psychology. A few months after his return Harvard president CHARLES WILLIAM ELIOT invited Hall to deliver a series of well-received lectures on pedagogy. Influenced by experimental psychology, he called for educational reform, advancing the evolutionary idea that the pupil naturally repeats “the course of the development of the race, and education is simply the expediting and shortening of this course.”

Recently established in 1876, Johns Hopkins University appointed Hall an instructor of psychology and pedagogy in 1882 and provided him with \$1,000 to set up a psychological laboratory. Led by DANIEL COIT GILMAN, Johns Hopkins was on the cutting edge of scientific devel-

opment. The following year Hall furthered the cause of educational reform and helped establish himself as a leading critic of pedagogy with his study “The Contents of Children’s Minds” in the *Princeton Review*. While continuing research in his laboratory, Hall inspired gifted young scholars at Hopkins, including the psychologist James McKeen Cattell and philosopher-educator John Dewey. He also promoted the study of psychology in America as an experimental science rather than on impressionistic evidence or abstract theories. In 1887 he founded the *American Journal of Psychology* and later called for the establishment of the American Psychological Association, which in 1892 named him its first president.

As a leading pedagogical expert, Hall, in 1888, became the first president of Clark University in Worcester, Massachusetts. Its founder, Jonas Gilman Clark, wished to establish a men’s college similar to Williams, but Hall convinced him to establish a university on the German model, with a strong graduate-research program. The school was launched in 1889, with a distinguished faculty, including the anthropologist Franz Boas. Hall had, however, underestimated the cost of a graduate-research program and overestimated the size of Clark’s fortune. The university ran into financial difficulty, Clark and Hall fell out, and by 1892 most of the distinguished faculty, feeling Hall had deceived them, had moved to the University of Chicago. Hall retained the presidency only because the university’s board of trustees, headed by Senator GEORGE F. HOAR, backed him rather than Clark. On top of these problems, the accidental death in 1890 of his wife and daughter devastated Hall. In 1899 he married Florence E. Smith, a teacher, with whom he had no children.

Clark died in 1900, and his bequest enabled the university under Hall to flourish on a modest scale. In 1909 Hall, who had become interested in psychopathology, hosted one of the most distinguished and influential academic conferences ever held in the United States. He invited both Sigmund Freud and Carl Jung to celebrate the

20th anniversary of Clark's founding, and their presence stimulated American interest in psychoanalysis.

During his years at Clark University, Hall continued his interest in the mental development of young people and became the leader of the child study movement. In 1891 he founded its journal, *Pedagogical Seminary*, and in 1893 he presided over a conference on experimental psychology in EDUCATION at the WORLD'S COLUMBIAN EXPOSITION in Chicago. In 1904 he published a two-volume work, *Adolescence, Its Psychology and Its Relation to Physiology, Anthropology, Sociology, Sex, Crime, Religion and Education*, summarizing the literature on adolescence. Two years later Hall distilled that work into the less technical and more readable college textbook *Youth: Its Education, Regimen and Hygiene* and followed it with *Educational Problems* (1911).

With the downsizing of his grandiose dream for Clark University, Hall in 1893 returned to the classroom and taught a variety of courses in psychology, as well as the history of philosophy. His teaching program, the persuasive theory of EVOLUTION, and his fascination with the minds of children and youths moved him to emphasize genetic psychology more than the laboratory and scientific psychology. Hall elaborated on the observation he had made in his 1880 Harvard lectures that the development of the mind from the birth of the individual reproduced the evolution of the mind in humankind (a so-called law of recapitulation, which is no law). Hall's interest in genetic psychology dovetailed with his study of a child's life.

Hall was a prolific writer. He wrote the *Founders of Modern Psychology* (1912) and, combining recent interests with his early training, published a two-volume study of *Jesus, the Christ, in the Light of Psychology* (1917). Hall contributed personal insights to his *Senescence: The Last Half of Life* (1922) as well as an autobiography, *Life and Confessions of a Psychologist* (1923). Hall's influence on scientific psychology, child development, and educational reform was great during his lifetime. But, as befits an advocate of evolution, some of his Victorian ideas (his emphasis on female characteristics and sex differences in mental ability, for example) have been discarded. Hall died on April 24, 1924.

See also VICTORIANISM.

**Hanna, Marcus Alonzo** (1837–1904) *businessman, politician*

Marcus Hanna, perhaps the most successful political organizer in the Gilded Age, was born in New Lisbon, Ohio, on

September 24, 1837, entered the family wholesale grocery business in Cleveland, and in 1862 he became a partner upon his father's death. Two years later he married the daughter of a coal and iron industrialist, eventually controlling that company, had interests in a bank, a newspaper, and in streetcars. He was a generous, paternalistic employer, made it his business to get along with his workers, and in time accepted labor unions.

By 1880 substantial contributions to the Republican Party won him a place on that party's state committee. Sharing with WILLIAM MCKINLEY the views that large corporations were the wave of the future and that the protective tariff benefitted both capital and labor, Hanna became his chief promoter and identified Bill McKinley with the high-tariff 1890 McKinley bill. Hanna helped elect McKinley governor of Ohio in 1891 and launched a McKinley-for-president campaign, gaining him some support in 1892 and succeeding in 1896. Hanna did so by carefully marshaling the support of both business and political leaders.

Named chairman of the Republican National Committee, Hanna managed McKinley's presidential campaign with great success. The 1883 PENDLETON CIVIL SERVICE REFORM ACT prohibiting assessments of civil servants had dried up that source of campaign funds, but Hanna assessed corporations and amassed an unprecedented \$3.5 million. He was aided in part because of McKinley's views and in part because the inflationary Free Silver ideas of the Democratic nominee WILLIAM JENNINGS BRYAN were perceived as dangerous (see FREE SILVER MOVEMENT), although Hanna was largely responsible for that perception. Hanna shrewdly used the corporate money to project the image of McKinley as the advance agent of prosperity, stability, and harmony. McKinley's triumph was Hanna's triumph; and Hanna, perhaps more than anyone else in American history, deserves the title of "president maker."

Hanna advised, but did not attempt to dominate, President McKinley. Neither was he a dominating force after he was appointed to the Senate from Ohio in 1897 and elected to a full term in 1898. He reluctantly supported the war with Spain and the acquisition of the Philippines and in 1900 was unable to prevent the nomination of Theodore Roosevelt as McKinley's running mate. After Roosevelt became president following McKinley's assassination, Hanna had little use for his progressive policies, but could not thwart them. He died in Washington on February 15, 1904.

**Harlan, John Marshall** (1833–1911) *Supreme Court justice*

John Marshall Harlan, the great dissenting SUPREME COURT judge, was born on June 1, 1833, in Boyle County, Kentucky, the son of James Harlan and Eliza Shannon Davenport. A graduate of Centre College in Danville, Harlan attended law school at Transylvania University in Lexington and completed his studies in his father's law office in Frankfort, Kentucky. In 1853 Harlan was admitted to the Kentucky bar, and from 1854 to 1856 he served as the city attorney for Frankfort. In 1856 he married Malvina French Shanklin of Evansville, Indiana, with whom he had six children. From 1858 to 1861 he served as a judge of the Franklin County Court.

Although at first a supporter of the Whig Party, its demise in the 1850s led Harlan into the Know-Nothing Party. In the 1860 presidential election, Harlan endorsed the Constitutional Union Party ticket of John Bell and Edward Everett. During the Civil War, he recruited the 10th Kentucky Volunteer Regiment for the Union army and served as its colonel until he resigned in 1863.

From 1863 to 1867 Harlan served as the attorney general of Kentucky. Although a supporter of the Union, he was a critic of the Lincoln administration and in 1864 endorsed the Democratic presidential candidate George B. McClellan. When the Thirteenth Amendment abolishing slavery in the United States was proposed in 1865, Harlan opposed it on the grounds that it violated state sovereignty. Following the war, Harlan joined the Republican Party and reversed his initial position on the Thirteenth Amendment. He also supported the Fourteenth and Fifteenth Amendments as well.

Harlan ran unsuccessfully as the Republican candidate for governor of Kentucky in 1871 and 1875. He led the Kentucky delegation at the 1876 Republican National Convention, where he initially supported the candidacy of his law partner Benjamin H. Bristow. Harlan, however, switched his support and led his delegation behind the candidacy of RUTHERFORD B. HAYES, who went on to win the Republican nomination and subsequently the PRESIDENCY. In April 1877 President Hayes named Harlan to the Louisiana Electoral Commission, which was established to finesse the departure of federal troops from Louisiana. In October 1877 Hayes nominated Harlan for a seat on the U.S. Supreme Court.

During his long career on the Court, Harlan became known for his dissenting opinions. He supported the extension of rights to AFRICAN AMERICANS and was an advocate for government regulation of industry. In the *United States v. E. C. Knight Company* (1895), Harlan strongly dissented from the Court's ruling that the creation of the Sugar Trust did not violate the SHERMAN ANTITRUST ACT (1890). He dissented from the Court's decision in the *CIVIL*

*RIGHTS CASES* (1883) that equality of rights in public accommodations was not enforceable under the Fourteenth and Fifteenth Amendments. Harlan was also the sole dissenter from the Court's decision in *PLESSY V. FERGUSON* (1896) that upheld racial segregation by embracing the so-called separate-but-equal doctrine. Harlan argued that the Thirteenth Amendment barred not only slavery but also segregation, which is a "badge of slavery," and declared the "Constitution is color-blind, and neither knows nor tolerates classes among citizens."

In 1892 he was appointed by President BENJAMIN HARRISON to represent the United States in its arbitration case with Great Britain over the *BERING SEA DISPUTE*. Harlan also taught constitutional law at George Washington University. He died on October 14, 1911, in Washington, D.C.

**Harper, Frances Ellen Watkins** (1825–1911) *poet, lecturer, activist*

Frances Ellen Watkins was born in Baltimore, Maryland, in 1825, the only child of free AFRICAN AMERICANS. Orphaned before she was three, she was raised and educated by her aunt and uncle, Reverend William Watkins, who kept a school for free blacks. He was a diligent, self-educated abolitionist friend of William Lloyd Garrison and inspired his niece to excel and to struggle for freedom for slaves and equality for blacks and women. At the age of 13, she was employed in the home of a Baltimore bookseller, where she became an excellent seamstress and in her free time read widely and wrote poetry. From 1850 to 1852 she taught sewing at the Union Seminary at Wilberforce, Ohio, and later taught school at Little York, Pennsylvania.

Always an abolitionist, Frances soon became an anti-slavery activist and an associate of William Still, the black organizer of the Underground Railroad. In 1854 Watkins published her antislavery *Poems on Miscellaneous Subjects*, which sold well. In August of that year, in New Bedford, Massachusetts, she gave her first lecture, "Education and Elevation of the Colored Race." Her success as a lecturer and poet led the Maine Antislavery Society to employ her as a lecturer for the next two years, after which she lectured from New England to Ohio from 1856 to 1860.

Watkins was a superb lecturer. She merged her dignified, persuasive, and melodious delivery with poetic eloquence to convince her listeners that slavery was evil.

A feminist, she viewed slavery through the eyes of slave women and zeroed in on its cruelest aspects, as she moved audiences with prose and poetry. Her best known poem, "The Slave Auction," opened with

The sale began—young girls were there,  
Defenseless in their wretchedness,  
Whose stifled sobs of deep despair  
Revealed their anguish and distress.

And mothers stood with streaming eyes,  
And saw their dearest children sold;  
Unheeded rose their bitter cries,  
While tyrants bartered them for gold.

Much of the money Watkins earned from her book and lectures she donated to the antislavery cause.

In 1859, while John Brown awaited execution for his raid on Harpers Ferry, Watkins wrote him a widely publicized letter. "I would prefer," she said, "to see Slavery go down peaceably" by men renouncing that sin, but "I thank you, that you have been brave enough to reach out your hands to the crushed and blighted of my race." Watkins sent Brown's wife, Mary, "a few dollars" and spent two weeks with her at Still's home, while she awaited her husband's execution.

Although Watkins was primarily a poet, her story "The Two Offers" (1859), was the first short story to be published by an African-American woman. Reflecting a feminist viewpoint, it was about two cousins who could have belonged to any race. One cousin entered an unhappy union with a repressive husband, while the other, with whom Watkins obviously identified, remained single, independent, and happy, while pursuing a career as a writer. Watkins clearly indicated that she would not give up her career, if she married.

A year later, on November 22, 1860, in Cincinnati, Ohio, she married Fenton Harper. Settling on a farm near Columbus, they had a daughter. Despite the coming of the Civil War in 1861, Frances Harper's career slowed. But, after her husband died in 1864, she lectured more regularly in support of emancipation and the Union cause. When the war ended, she backed Radical Reconstruction and wrote poems praising Charles Sumner and Thaddeus Stevens. She toured the South and spoke to both black and mixed audiences. She exhorted African Americans to become educated, be temperate, and be moral, while she denounced whites for murdering and intimidating black voters. Advocating suffrage rights for both blacks and women, Harper worked for both groups. In 1869, however, facing political reality and in agreement with LUCY STONE, Harper accepted the postponement of woman suffrage and campaigned for black male suffrage. She continued to press

for the vote for women and attended conventions of Stone's American Woman Suffrage Association.

In 1871 Harper settled in Philadelphia and kept working for equality, justice, and temperance. Recognizing that alcoholism accentuated the economic plight of blacks, Harper was moved by the dire effects of a drunkard husband and father upon his family. She headed the Department for Negroes for the Women's Christian Temperance Union. Her novel *Iola Leroy; or, Shadows Lifted* (1892) about an octoroon woman who decides not to pass as white combined Harper's civil rights and WOMEN'S RIGHTS concerns. Outraged by the murder of an innocent boy, Harper, in her poem "The Martyr of Alabama," matched the fervor of her abolitionist poetry as she called "Church of Christ arise! arise!" and "Avert the doom that crime must bring / Upon a guilty land." Closer to home, Harper was troubled by the problem of juvenile delinquency among blacks in urban areas, and in 1894 she became a director of the American Association for Education of Colored Youth. She was also an organizer of the NATIONAL ASSOCIATION OF COLORED WOMEN in 1896 and the next year became its vice president. An ardent Christian whose theology stressed the righting of social wrongs, Harper was a Unitarian. She died on February 22, 1911, in Philadelphia.

Harper, 1825–1911* (Detroit: Wayne State University Press, 1994); Frances Smith Foster, ed., *A Brighter Coming Day: A Frances Ellen Watkins Harper Reader* (New York: Feminist Press at the City University of New York, 1990).

### **Harrison, Benjamin** (1833–1901) *23rd president of the United States*

Benjamin Harrison, the 23rd president of the United States, was the grandson of William Henry Harrison, the ninth president. Although Ohio born and educated (Miami University, 1852) and trained in the law, Benjamin Harrison moved in 1854 to Indianapolis, Indiana, with his bride of one year, Caroline Lavinia Scott. A deeply religious Presbyterian, Harrison by dint of hard work became a successful lawyer, and by possessing both strong moral feelings about slavery and stump speaking skills, he became a leading member of the Republican Party. But while he could move a multitude, he was cold and aloof in small groups and with individuals. During the Civil War he helped raise the 70th Indiana regiment, was appointed its colonel by Governor Oliver P. Morton, fought effectively in General William T. Sherman's 1864 Atlanta campaign, stumped effectively in Indiana's 1864 political campaign, and emerged from the war a brigadier general with bright political prospects. He could have won a seat in CONGRESS, but his wife objected

to further absences from home and he returned to his law practice in Indianapolis. He prospered and by campaigning vigorously for others remained a prominent Republican.

In 1876 Harrison agreed to run for governor and lost a close race to James Douglas (Blue Jeans) Williams, but in 1881 the Indiana legislature elected Harrison to one term in the U.S. Senate. There his probity preserved his purity and his aloofness ensured his lack of influence while he worked for pensions for union veterans and a protective tariff. These qualities enhanced Harrison's "availability" for the 1888 Republican presidential nomination when coupled with the certainty that he could carry Indiana, an important swing state. When JAMES G. BLAINE, the most popular Republican of that era, decided not to run, the available candidate—the least offensive to all factions—to run against the incumbent GROVER CLEVELAND proved to be Harrison. Although Cleveland won more popular votes, Harrison, with his votes more strategically located, won a majority in the electoral college and was elected president.

Although his orderly, lawyerly mind made him a good administrator, Harrison's frigid personality made him an inept politician. He managed to offend Republican congressmen even while awarding them with patronage. As everyone expected, he made Blaine his secretary of state but appeared reluctant to do so. Initially, they worked well together, but in time they drifted apart. Harrison succeeded in offending both civil service reformers and spoilsmen. When his assistant postmaster general quite legitimately replaced Democratic postmasters who were not covered by CIVIL SERVICE REFORM rules, reformers objected, and when Harrison's most prominent civil service commissioner Theodore Roosevelt frustrated spoilsmen, *they* howled. But despite Harrison's support, Roosevelt dismissed him as "a coldblooded, narrow-minded, prejudiced, obstinate, timid old psalm-singing Indianapolis politician." That most unfair characterization was belied, for example, by Harrison's consistent support on moral grounds of a Federal Elections bill that would enforce the Fifteenth Amendment and enable African Americans to vote. Southern Democrats secured the support of westerners anxious to pass inflationary silver legislation, thus blocking passage in 1890 of what they called the Force bill.

Policies and legislation adopted during Harrison's administration wiped out the \$100 million surplus of revenue over expenditures. His commissioner of pensions for six months, "Corporal" James Tanner, exclaimed "God help the surplus!" as he arbitrarily raised disability payments before being forced out of office, but Congress in 1890 passed the Dependent and Disability Pension Act for Union veterans, which raised the appropriation for pensions from \$81 million to \$135 million. In that same year the "Billion Dollar Congress" passed the MCKINLEY TARIFF, which raised

Benjamin Harrison (*Library of Congress*)

already protective rates to new heights, but it also included a reciprocity feature both Blaine and Harrison fought for. To secure western votes for the McKinley Tariff, anti-inflationary easterners agreed to the Sherman Silver Purchase Act (1890), which required the U.S. Treasury to purchase 4.5 million ounces of silver monthly with notes redeemable in gold or silver. By redeeming these notes in gold, the Harrison administration kept the United States on the gold standard but began to erode the Treasury's gold reserve. At Harrison's request and to redeem an 1888 campaign pledge, Congress also passed the SHERMAN ANTITRUST ACT (1890), which outlawed combinations in restraint of trade. But vague wording, lax enforcement, and judicial hostility made the Sherman Act ineffective over the next decade, while mergers and monopolies proliferated.

Contrary to expectations, Harrison was not dominated by Blaine (whose health declined) in the conduct of a vigorous FOREIGN POLICY. Harrison favored a strong navy, an Isthmian canal, and the acquisition of naval bases (securing a protectorate in SAMOA in 1889). He supported the first modern Pan-American Conference (1889), negotiated eight reciprocity agreements under the McKinley Tariff, and managed to open European markets previously closed to American pork. Harrison was aggressive in the BERING SEA DISPUTE with Great Britain; chauvinistic when

American sailors were killed in Valparaiso, Chile; and not overly disturbed by Italy's outrage when a New Orleans mob lynched alleged members of the Mafia. Harrison's biggest foreign policy disappointment was his last-minute failure to secure Senate approval of a treaty annexing HAWAII.

The legislation of the billion-dollar Congress, especially the McKinley Tariff, resulted in a Democratic landslide in 1890. Despite the coolness of Blaine and other leading Republicans, Harrison was renominated in 1892 and defeated by Cleveland. Prior to the death of his wife just before that election, Harrison had an affair with her niece Mary Lord Dimmick, whom he married in 1896. After the presidency, Harrison represented Venezuela in the VENEZUELA BOUNDARY DISPUTE and helped frustrate Great Britain's ambition to control the mouth of the Orinoco River. He died on March 13, 1901, in Indianapolis.

**Harte, Bret** (1836–1902) *poet, novelist, short story writer*

With a writing career that inspired such astronomical metaphors as “meteor” and “supernova,” Bret Harte's brilliant beginning faded into obscurity. Born Francis Brett Harte in Albany, New York, on August 25, 1836, Harte with his family moved several times before his father, an unsuccessful teacher, died in 1845 and his mother with four children settled in New York and Brooklyn. Harte was an avid reader and wrote poetry, but his schooling ended at 13 years of age, when he went to work; at 16 he was on his own. In 1853 his mother remarried and moved to Oakland, California, and Harte followed the next year. He drifted about until 1857, when he joined a married sister in Arcata. There he resolved to be a writer, worked on the local newspaper, the *Northern Californian*, which on occasion was left in his charge, and published some pieces in San Francisco and in the East. In 1860 he fled Arcata for San Francisco after editorially condemning the mass murder of 60 peaceful NATIVE AMERICANS, most of whom were women and children, by a local drunken mob.

In San Francisco, Harte worked for the *Golden Era*, to which he had earlier contributed, gained recognition, and made important friendships. Jesse Benton Fremont got him a position in the Surveyor General's Office and intro-

duced him to Thomas Starr King. A prominent Unitarian clergyman, King inspired Harte, criticized his poetry, and enlisted his support in abolitionism and the effort to keep California in the Union during the Civil War, which Harte aided with patriotic poetry. King also helped Harte get a better job at the branch U.S. Mint. It was in King's church that Harte met Anna Griswold (an alto in the choir), whom he married on August 11, 1862. They had four children. King and Fremont convinced the *Atlantic Monthly* to run one of Harte's short stories in 1863.

Harte helped establish the *Californian* in 1864 and contributed regularly to it over the next two years. But his career took off after 1868, when he became the first editor of the *Overland Monthly*. In its second issue Harte published “The Luck of Roaring Camp” and followed it five months later with “The Outcasts of Poker Flat.” By locating these two short stories in the California mining country, Harte found literary gold. They were the best stories Harte ever wrote and were an enormous success among the literary arbiters in the Northeast. Location played a large role in their appeal, and they inspired other writers to use local color. These humorous stories carried realism to new heights or depths for some. “The Luck” was both a parable of the life and influence of Jesus and a parody, as the Luck's mother was a prostitute and the miners were a vulgar lot. Gifts from these unlikely Magi included stolen silver, a tobacco box, and a revolver. “The Outcasts,” who are prostitutes and a gambler, are also redeemed by their chance encounter with innocence.

Harte's 1870 poem “Plain Language from Truthful James,” better known as “The Heathen Chinese,” was a satirical attack on racial prejudice. Ah Sin proved to be a more adept cheater at cards than either Bill Nye or James, who had expected to fleece the innocent Asian. In addition to his defense of American Indians at Arcata, Harte attacked the 1866 decision to exclude AFRICAN AMERICANS from the Fourth of July parade, with the lines “You'll do to fight our battles with, but not / To celebrate the victory won.”

At the high point of his career Harte was the acknowledged leader of writers in San Francisco, including MARK TWAIN and Ambrose Bierce. But when he left San Francisco in 1871, his career went into a long decline. He received a \$10,000, 12-month contract from the *Atlantic Monthly*, but the quality of his work was disappointing, and the contract was not renewed. Over the next several years he drank heavily, ran into debt, and collaborated with Twain on a play, *Ah Sin*, which destroyed their friendship. Although Harte wrote steadily, nothing was very successful. At the behest of WILLIAM DEAN HOWELLS, the RUTHERFORD B. HAYES administration appointed Harte consul at Krefeld, Germany, and he left for Europe in 1878 and did not return to the United States. Two years later he

transferred to the more lucrative consulate at Glasgow, in Scotland. When, with the change of parties in 1885, he lost that post, he moved to London. There, despite ill health, he continued to grind out stories on California themes, but none were equal to either "The Luck" or "The Outcasts." He died on May 5, 1902.

## Hawaii

Great Britain, France, and the United States became interested in Hawaii after its discovery by Captain James Cook in 1778. American missionaries arrived in 1820, and treaties of friendship and commerce with the Kingdom of Hawaii were signed by the United States in 1826, Britain in 1836, and France in 1839. The U.S. Senate did not ratify its treaty, but Hawaii abided by its provisions, and in 1842 the United States recognized Hawaii's independence. American whalers used Hawaii as a base, and with American acquisition of Oregon and California a few years later, Hawaii's importance for the defense of the West Coast became apparent. In 1851 when France had designs on Hawaii, the United States warned that it would not permit its annexation by a European power.

It was in the Gilded Age that America solidified its influence in Hawaii. More for strategic than for economic reasons, the United States in 1875 entered into a reciprocity agreement with the Hawaiian kingdom whereby both nations agreed to drop tariffs on a long list of products, the main one being sugar. Within a year American capital began to flood the island, and sugar production by American growers skyrocketed. In 1887 the reciprocity treaty was extended, and the United States was permitted to establish a naval base at Pearl Harbor.

Since the royal family was capricious, Americans in Hawaii generally favored annexation by the United States to protect their property. But after the MCKINLEY TARIFF of 1890 put foreign sugar on the free list (depriving Hawaii of its favored position) and gave domestic sugar a two cent per pound subsidy, they became ardent annexationists. In addition Queen Liliuokalani, advocating "Hawaii for the Hawaiians," set aside the Constitution of 1887 that favored whites and promulgated an autocratic constitution in 1893. American planters, with the con-

nivance of U.S. minister John L. Stevens and aided by a contingent of marines, ousted Queen Liliuokalani and declared a republic, but they immediately agreed to a treaty of annexation with the United States in the closing days of Republican president BENJAMIN HARRISON's administration. The Senate, however, failed to ratify the treaty before the incoming Democratic president GROVER CLEVELAND, an anti-imperialist, took office. Cleveland, suspicious of Stevens's actions, withdrew the treaty and sent Georgia congressman James H. Blount to Hawaii to investigate. After a thorough investigation Blount concluded that Stevens and the American military had actively abetted the coup. Contrary to dispatches from Stevens, marines from the cruiser USS *Boston* were not called out to protect American lives but were strategically placed across from the royal palace, which was far away from the consulate or any American property.

After reading the report, Cleveland and his secretary of state Walter Q. Gresham wished to regain the throne for the queen and amnesty for the rebels. The queen, however, insisted that the coup leaders be beheaded as Hawaiian custom dictated, while Sanford Dole, president of the provisional republic of Hawaii, would not resign and said that the United States could either annex Hawaii or respect its independence. Unable to work out a solution, Cleveland placed the problem in the lap of CONGRESS in December 1893 and stated that he would execute whatever solution it devised. After much partisan wrangling, Congress neither annexed the islands nor attempted to disturb Dole's provisional government. On July 4, 1894, the provisional government became the Republic of Hawaii, and a month later Cleveland acquiesced and recognized the white minority government.

Cleveland was succeeded in 1897 by Republican WILLIAM MCKINLEY, who was more aware of the islands' strategic value and less troubled by the illegitimate birth of the Republic of Hawaii. Accordingly, in June 1897 a new treaty of annexation was signed, but strong Democratic opposition prevented ratification. Annexation, however, became imperative following Admiral GEORGE DEWEY's stunning victory at Manila Bay and the need to "bridge the Pacific." That victory also emphasized the perception of Admiral ALFRED THAYER MAHAN that Hawaii was the "key to the Pacific." In July 1898, during the SPANISH-AMERICAN WAR, the United States annexed Hawaii by a joint resolution of Congress with McKinley's approval.

**Hay, John Milton** (1838–1905) *statesman, writer*

John Milton Hay capped his distinguished literary and diplomatic career by serving as secretary of state from 1898 to 1905. Born in Salem, Indiana, on October 12, 1838, Hay grew up in Illinois, graduated from Brown University, and by 1860 was back in Illinois studying law in the office of his uncle in Springfield. Friendship with Abraham Lincoln's secretary, John Nicolay, enabled Hay to become assistant personal secretary to the new president in 1861. The youthful presidential aide won the confidence of his chief and also amused him with his storytelling ability. After the Civil War, from 1865 to 1870, Hay received brief diplomatic postings to Paris, Vienna, and Madrid, where he despised European aristocrats and sympathized with radical democrats. He achieved fame in 1871 as a poet with the publication of *Pike County Ballads and Other Pieces*, and from 1870 to 1875 he wrote editorials for the *New York Tribune*. In 1874 he married Clara Stone the daughter of Cleveland railroad builder and financier Amasa Stone, and from 1878 to 1881 Hay served as assistant secretary of state. Disturbed by the GREAT STRIKE OF 1877, Hay had become conservative and anonymously published in 1883 an antilabor novel, *The Bread-winners*, and in the 1880s he wrote with Nicolay a 10-volume biography of Lincoln.

Having married wealth, Hay was a heavy contributor to the Republican Party and in 1897 was delighted to be appointed by WILLIAM MCKINLEY as ambassador to Great Britain. As an ardent Anglophile, Hay facilitated the rapprochement between London and Washington and encouraged British support of the United States in the SPANISH-AMERICAN WAR. Soon after hailing it as the "splendid little war," Hay in August 1898 became secretary of state, and although he had earlier opposed IMPERIALISM, he favored the acquisition of the Philippines (with their proximity to China) at that war's end and defended the American suppression of the subsequent FILIPINO INSURRECTION. In the OPEN DOOR NOTES of 1899 to 1900, Hay sought to prevent the dismemberment of China and to preserve equal access there for American investors and missionaries at a time when other foreign powers were acquiring spheres of influence. In the Caribbean, Hay obtained British acquiescence to an American-fortified isthmian canal across Central America in 1901; negotiated a treaty with Colombia for a canal zone in its province of Panama, which that government rejected; and then in 1903 negotiated similar concessions from Panama following its successful (with American help) revolt against Colombia. In his last year in office Hay played a lesser role in FOREIGN POLICY as President Theodore Roosevelt essentially became his own secretary of state. Hay died on July 1, 1905.

**Hayden, Ferdinand Vandeveer** (ca. 1828–1887) *geologist*

One of the Gilded Age's distinguished explorer-geologists, Ferdinand Hayden was born on September 7, probably in 1828, in Westfield, Massachusetts. He had a miserable childhood, which he later tried to hide. When he was 10, his mother left his father, a shiftless alcoholic, and around 1840 Hayden went to live with a paternal aunt in Rochester, Ohio, where he benefited from love and stability. Ambitious and intellectually curious, he enrolled in Oberlin's Preparatory Department in 1845 and five years later graduated from Oberlin College, where he demonstrated a marked interest in natural history, which was taught from a creationist standpoint. Hayden taught school for a year and a half until December 1851, when he began studying medicine and natural history in Cleveland with Jared Potter Kirtland and John Strong Newberry (who from 1869 to 1882 would direct the Ohio Geological Survey). Newberry introduced Hayden to James Hall, the paleontologist of the New York Geological Survey, who, in summer 1853, sent him along with Fielding Bradford Meek on a fossil-collecting expedition to the Bad Lands of Dakota. Upon his return Hayden completed his medical training at Albany Medical College in January 1854, but he had already found his life work of exploring the West, searching for its fossils and studying its geology.

From 1854 to 1860 Hayden went on four additional major expeditions (among his sponsors were the Smithsonian Institution and the U.S. Army), exploring a vast territory from the Dakotas west to Idaho and south to Kansas and Colorado. Hayden was intensely ambitious, aggressive, energetic, and difficult to get along with. He was a talented, prolific writer who popularized the scenic wonders of the West, while establishing his preeminence as a field geologist and hunter of fossils. In 1855 in an ascent of the Missouri River, he found the first fossils of American dinosaurs in Montana, was elected in 1856 a corresponding member of the Academy of Natural Sciences of Philadelphia, and that same year published his first article (with Meek) in its *Proceedings*. The next year he published his first geological map. From 1861 to 1862 he lived in Washington and wrote *On the Geology and Natural History of the Upper Missouri* (1862), offering evidence in support of Darwin's theory of EVOLUTION (before reading *On the Origin of Species*), and *Contributions to the Ethnography and Philology of the Indian Tribes of the Missouri Valley* (1882), a linguistics study, demonstrating the breadth of Hayden's interests.

From 1862 to 1865 Hayden utilized his medical training while serving in the Union army, and after the war he was appointed an auxiliary professor of geology and mineralogy at the University of Pennsylvania (1865–72). On November 9, 1871, he married Emma Woodruff of Philadelphia. They had no children.

Hayden's academic position did not interfere with his explorations of the West, which were conducted during the summer. In 1866 he was back in the Bad Lands, and in 1867 he was made the head of the Nebraska Geological Survey, which by 1873 evolved into the U.S. Geological and Geographical Survey of the Territories but was informally known as "the Hayden Survey." It continued until 1879. His explorations with it were primarily in Wyoming and Colorado, and as colleagues, he attracted a number of geologists and natural history specialists and through the survey sponsored the publication of their studies. The survey's *Atlas of Colorado* (1877), covering its geology and geography, was very influential. Hayden continued his own studies, but also conveyed his love of the "Wonders of the West" to the general public in *Sun Pictures of Rocky Mountain Scenery* (1870) and in magazines, such as *Scribner's Monthly*.

When Congress established the U.S. GEOLOGICAL SURVEY (USGS) in 1879, Hayden was a leading candidate to be its head. The USGS was to a large degree modeled on the Hayden Survey, he was popular among western congressmen, and he was a gifted field geologist. President RUTHERFORD B. HAYES, however, appointed Hayden's chief rival, CLARENCE KING, to be its head. Hayden's ambitious, aggressive personality had by this point made enemies not only of his rivals, King and JOHN WESLEY POWELL, but also of other scientists, such as OTHNIEL CHARLES MARSH and CHARLES WILLIAM ELIOT (president of Harvard), and his benefactors Hall and Newberry. These men backed King and attacked Hayden's science and character. Powell said he was a fraud, Eliot referred to "his low habits in camp," Hall called him a "Charlatan in geology," Marsh lobbied against him, and Newberry visited Hayes, who had appointed him to the Ohio Survey, to disparage Hayden and back King. Hayes nevertheless was justified in his decision. Hayden's best work had been carried out in collaboration with Meek prior to the Civil War, his subsequent work was not as valuable as that of King or Powell, and few geologists of stature were likely to work for the irascible Hayden had he become director of the USGS.

With King and Powell (who succeeded King in 1881) running the USGS, Hayden, although named its fourth principal geologist, worked primarily out of Philadelphia. He continued to do fieldwork in Montana and in 1883 completed a superb geological map, summarizing the 12-year work of the Hayden Survey. His health failed in 1886, and on December 22, 1887, he died in Philadelphia. Although overshadowed by King and Powell, Hayden amassed a sub-

stantial body of research essential for geological syntheses in the United States and is primarily responsible for the establishment of Yellowstone National Park.

### Hayden, Sophia Gregoria (1868–1953) *architect*

Sophia Hayden was born in Santiago, Chile, on October 17, 1868, but after 1874 lived with her grandparents in Jamaica Plain, Massachusetts. In 1886 she became the first woman to study architecture at the Massachusetts Institute of Technology (MIT). Her instructor was Eugene Letang, who had trained at the Ecole des Beaux-Arts in Paris. Echoing that training, Letang was interested primarily in monumental buildings, but his program went beyond design to include architectural engineering and the history of architecture. Hayden graduated with honors in 1890; her thesis project was "A Design for a Museum of Fine Arts" in the neoclassical style, illustrated by superb watercolors. As the president of MIT remarked, she also was as capable as any male architect to build a railroad bridge. Although Hayden intended to practice as an architect, her first job was teaching mechanical drawing at the Eliot School in Jamaica Plain.

The following year the opportunity of a lifetime came Hayden's way. The WORLD'S COLUMBIAN EXPOSITION (1893) in Chicago, like its predecessor, the PHILADELPHIA CENTENNIAL EXPOSITION (1876), called for a Woman's Pavilion and set up a Board of Lady Managers headed by Bertha Palmer to supervise the project. A social leader, labor reformer, as well as a stylish woman, Palmer fought for "equal pay for equal work" for women, entertained factory workers and milliners as well as wealthy Chicagoans in her home, and was noted for her ostentatious display of her seven-strand necklace of 2,268 pearls. In 1891 the Board of Lady Managers solicited, under the heading of "An Unusual Opportunity for Women Architects," plans for a monumental Woman's Building. Its exhibits were to show "woman's progress and development, and her increased usefulness in the arts, sciences, manufactures, and industries of the world." The winning architect would be awarded \$1,000 plus expenses.

Despite her youth and her lack of experience, the competition was tailor-made for Hayden. Her training with Letang emphasized monumental buildings, and her thesis project was not a townhouse or a country cottage but an art museum with adequate spaces for exhibitions. Furthermore, her admiration of the neoclassical style echoed the

preferences of DANIEL HUDSON BURNHAM and his team of architects, who created the same Chicago fair's memorable neoclassical White City.

Designing a building in the Italian Renaissance style, Hayden won the prize and became the first woman to design a major building in the United States. Because of its size and probably because of the contemporary perception of women, Hayden aimed to make it "more delicate and refined" than other White City buildings. Over the next year, with less than \$500 extra compensation for planning the \$150,000 building, Hayden drew working plans for the building and supervised its construction. Male architects at the fair received three to 10 times more compensation. Hayden refused to be pressured by Palmer or other members of the Board of Lady Managers to make what Hayden considered unsuitable changes or to use women-produced material and designs she deemed inappropriate. She was also frustrated by the demands of the male-dominated Board of Construction. Hayden was prompt with her drawings, and her building was the first of the fair's buildings to be completed.

Hayden was on hand for the formal dedication of the Woman's Building on October 21, 1892, 400 years after Columbus's arrival in the New World. Palmer used the occasion to protest the treatment of women—their inadequate education, poor pay, and their enforced dependence on men. Ironically, the career of the architect, whose building she was dedicating, illustrated the evils Palmer denounced.

Sick of arguing with her clients and exhausted by her long months of work, Hayden was not present in May 1893 when the fair belatedly opened. Wanting their profession to remain a male bastion, the editors of *American Architect and Building News* claimed that rumors of Hayden's "mental collapse" were a "telling argument against the wisdom of women entering" their profession. When Hayden received three awards for the Woman's Building, male architects put her down. They claimed her building's "graceful timidity" revealed "the sex of its author." Burnham, however, praised the building's "delicacy of style, artistic taste, and geniality and elegance of the interior hall" and awarded Hayden the Artists Medal. Hayden could not have been seriously indisposed in May 1893, because by 1894 she had designed a memorial building for American Women's Clubs. Possibly because of the economic depression of the 1890s, it was never built. Lacking a base and encouragement, she became, despite her splendid start and training, an artist, rather than an architect. Hayden married a fellow artist, William Blackstone Bennett, in 1900. She died in Winthrop, Massachusetts, on February 3, 1953.

Schulte Publishing, 1963); Susana Torre, ed., *Women in American Architecture: A Historic and Contemporary Perspective* (New York: Whitney Library of Design, 1977).

### **Hayes, Rutherford B.** (1822–1893) *19th president of the United States*

Born in Delaware, Ohio, on October 4, 1822, three months after his father died, Rutherford Birchard Hayes, had a happy, although sheltered childhood and found a role model in his uncle Sardis Birchard, who prospered as a merchant and land speculator. Hayes was a good student, graduating from Kenyon College as valedictorian of his class in 1842 and from Harvard Law School in 1845. Admitted to the Ohio bar that year, he then spent five unchallenging years in Lower Sandusky (later Fremont), the home of his uncle Sardis.

Hayes moved to Cincinnati, the largest city in the West, on Christmas Eve 1849 to make his mark or fail. His practice grew slowly but picked up as he gained a reputation as a defender of murderers. He also enjoyed the cultural advantages and social life of a large city and fell in love with Lucy Webb, whom he married on December 30, 1852. Lucy, a strong believer in Methodism, abstinence from alcoholic beverages, and abolition, influenced but did not radically change Hayes. He never joined a church but in time attended services regularly; he drank temperately but, as president, he became a teetotaler; and after marriage he abandoned his tepid antislavery stance and became a noted defender of runaway slaves. He opposed the extension of slavery into western territories and helped establish the Republican Party in Ohio. When the Civil War broke out in 1861, Hayes enthusiastically supported the Union cause, was commissioned in June as a major in the 23rd Ohio Voluntary Infantry, was wounded five times while serving for four years, and emerged from the war a major general and a popular war hero.

Elected to and a member of CONGRESS from 1865 to 1867, Hayes supported Radical Republican Reconstruction measures before he resigned to make the first of three successful runs for governor of Ohio. While in that office (1868–72, 1876–77), he fought successfully for passage of the Fifteenth Amendment (voting rights for blacks) to the U.S. Constitution, for the establishment of Ohio State University, and for the nonpartisan administration of asylums and prisons. His gubernatorial victory in 1875, despite a resurgent Democratic Party (capitalizing on a severe economic depression and political CORRUPTION in the Ulysses S. Grant administration), made Hayes a candidate for the 1876 Republican presidential nomination. He proved to be more "available" than other contenders, since he combined a distinguished military career with a radical record on Reconstruction issues, a reform record as governor, and

the capacity to carry a big swing state. Republicans nominated Hayes in hopes that he would unite the party and prevent defections to the Democrats.

Hayes and the Republicans had an uphill fight. Not only was the party identified with hard times and sleaze, but the Democrats also nominated Governor SAMUEL J. TILDEN of New York, who was renowned as a reformer and as a political organizer. The Republican tactic of identifying the Democrats with treason during and persecution of black Americans after the Civil War had lost its appeal to those who yearned for prosperity and political purity. Tilden had a majority of votes cast, but violence and intimidation in the South kept thousands of AFRICAN AMERICANS from the polls and enabled Republicans to void Democratic votes and claim that not Tilden but Hayes had carried South Carolina, Louisiana, and Florida, giving him a majority of one electoral vote (185 to 184) and the presidency. But Democrats, who controlled the House of Representatives and a majority in the joint session of Congress in whose presence the electoral votes would be counted, accused the Republicans of fraud and claimed those states and victory for Tilden. This disputed election was finally resolved in Hayes's favor on March 2, 1877, two days before Grant's term expired.

When Hayes took office, Republican Reconstruction governments existed only in South Carolina and Louisiana, and these governments held sway only in the vicinity of the state capital buildings, where small detachments of federal troops upheld their authority. Extralegal Democratic governments, supported ardently and violently by the white minority, controlled the rest of those states, and Republican authority could only be restored by sizable armies of occupation, which neither northern public opinion nor the House of Representatives would condone. Reinforcement was not a realistic option. Hayes himself had no faith in military coercion as a long-range cure for the South's problems and would rely instead on the school and the vote for blacks, the goodwill of the "better class" of whites, and erasing the color line in politics. Using his eroding bargaining position, Hayes extracted pledges from South Carolina and Louisiana Democrats to respect the civil rights of black and white Republicans before he ordered the troops to cease their support of the Republican governments. White southerners, including the so-called better people, reneged on those pledges by the next election, and the solid white-supremacy Democratic South became a reality.

Having settled on a southern policy, Hayes turned next to CIVIL SERVICE REFORM. His cabinet appointments, especially that of reformer CARL SCHURZ, offended Republican spoilsmen in Congress who were using federal patronage to maintain their hold on local party organizations. Hayes believed that the so-called senatorial courtesy of allowing senators and representatives to dictate who

should be appointed politicized the civil service, reduced its efficiency, and deprived the president of his power to be an effective administrator. In June 1877 Hayes prohibited forced political contributions (assessments) by civil servants and forbade their management of party organizations and political campaigns. Feeling that CHESTER A. ARTHUR, head of the New York customhouse, was not sympathetic to reform, Hayes succeeded in removing him after a long struggle with his political patron, ROSCOE CONKLING, over senatorial courtesy. Hayes then insisted that the merit system of appointing on the basis of competitive examinations be introduced in the customhouse, and its success in what was the largest federal office in the land helped secure the PENDLETON CIVIL SERVICE REFORM ACT of 1883.

The severe economic depression with its wage cuts and layoffs led to the GREAT STRIKE OF 1877. Beginning on the Baltimore & Ohio Railroad, it quickly spread to other roads and industries. As unemployed men and boys joined strikers, unprecedented riots, violence, and arson broke out, especially in Pittsburgh and Baltimore. Hayes did not break the strike, and he dispatched federal troops (who never fired a shot) only at the call of state and local officials. Despite the begging of THOMAS ALEXANDER

Rutherford B. Hayes (*Library of Congress*)

SCOTT of the Pennsylvania Railroad, Hayes would not order troops to run the trains on the pretext that the strike interfered with the U.S. mail. Although Hayes favored an eight-hour day for industrial workers, he disliked labor agitators. He also disliked railroad moguls and favored federal regulation of railroads.

Hard times also led to demands for currency inflation, which Hayes adamantly opposed on moral and practical, but certainly not political, grounds. Believing that inflation was dishonest and that fears of it prolonged the depression, Hayes insisted the United States return to the gold standard in 1879 (as scheduled by Congress in 1875) and opposed the popular 1878 BLAND-ALLISON ACT, which allowed the limited coinage of silver dollars at the ratio of 16 to one part of gold and which passed over his veto. The stunning business revival that accompanied the resumption of specie payments confirmed for Hayes his monetary orthodoxy.

Having offended spoilsmen and inflationists in his own party while failing to attract “better” southerners, who later also turned out to be racists, Hayes saw the Republican Party lose control of the Senate as well as the House in 1878. Ironically, the Democrats helped Hayes reunite Republicans and made possible their victory in 1880. Realizing that Hayes would veto any direct attempt to repeal the election laws designed to enforce the civil- and voting-rights principles of the Fourteenth and Fifteenth Amendments, the Democrats attached riders to necessary appropriations bills that they thought Hayes would be forced to sign lest the government be shut down. They were wrong; Hayes relished this “battle of the riders,” vetoed appropriations bills, and rallied public opinion and his party behind him with his stirring messages. Realizing the Democrats wished to stuff ballot boxes in northern cities and to intimidate southern blacks at the polls, Hayes argued for the sanctity of the ballot and defended executive power by maintaining that the riders unconstitutionally deprived the president of his veto power.

Hayes was a precursor of modern 20th-century presidents. He rallied public opinion to his side with his well-publicized vetoes and the short speeches he made while traveling extensively. By shrewdly expounding principles, exploiting issues, enhancing executive power, and introducing modern bureaucratic procedures, Hayes stressed the politics of reform that presidents have come to embrace. Ironically, Republican congressmen, wedded to the politics of organization, thought Hayes an inept politician, but his presidency illustrated his belief “that he serves his party best who serves his country best.”

After leaving office, Hayes campaigned tirelessly for social causes. His major emphasis was on EDUCATION, which was for him a panacea for society’s ills. He served on the boards of three universities in Ohio but was espe-

cially committed to the education of disadvantaged black and white children in the South. He was on the boards of the philanthropic Peabody and Slater funds and campaigned vigorously, but unsuccessfully, for distributing federal funds to impoverished school districts throughout the nation. He believed that education was the key to economic improvement, and for African Americans, economic improvement was the key to civil rights. He advocated industrial education for all children, whether their parents were rich or poor. If politicians and capitalists knew what it was like to work with their hands, they would understand labor’s demands and industrial strife would be mitigated. Hayes also believed education could rehabilitate criminals and was president of the National Prison Reform Association. As governor and president he had been generous with pardons and in time opposed the death penalty. He thought poverty caused crime and that wealth should be more evenly distributed through confiscatory inheritance taxes. He also saw the growing power of the corporation as a threat to the government and “the Standard Oil monopoly . . . a menace to the people.” In his remarkably active retirement, Hayes was a precursor of the Progressives. He died on January 17, 1893.

### Haymarket riot (1886)

The Haymarket tragedy is rooted in the Eight-Hour movement. The drive, beginning in 1865, to legislate an eight-hour workday had not succeeded, but the idea remained very popular. In 1884 the trade unions, organized in 1881 as the Federation of Organized Trades and Labor Unions of the United States, revived the idea by calling a nationwide strike for the eight-hour day on May 1, 1886.

In Chicago, anarchists saw the strike call as an excellent propaganda opportunity. Unfortunately, their revolutionary rhetoric combined with intense grassroots support for a shorter workday convinced many that Chicago was on the brink of a violent social upheaval. On May 1, 1886, a large number of people, led by prominent anarchists Albert Parsons and August Spies, peacefully marched up Michigan Avenue in support of the eight-hour day. But rather than allay fears of violence, the parade contributed to the general apprehension.

Two days later an unrelated incident touched off the anticipated violence. Earlier, on February 16, workers at the McCormick Harvesting Machine Company had gone on strike over the issue of hiring nonunion people. The company responded by shutting down the plant and then hiring replacements. Although production had not

regained its former levels, it became obvious by late April that McCormick had secured enough strikebreakers to defeat the union. To maintain its union-busting strategy, the company even granted its workers an eight-hour day when many refused to work on May 1. On May 3 union picketers attacked the strikebreakers as they left work. The Chicago police intervened by shooting into the crowd, killing two.

August Spies, a speaker at a nearby mass meeting in support of the eight-hour day, rushed to the scene and witnessed the carnage. Returning to the office of the anarchist newspaper he edited, Spies issued a pamphlet urging workers to arm themselves and attend a protest meeting the following evening at Haymarket Square. About 3,000 people braved the miserable weather to hear Spies and his fellow anarchists Parsons and Samuel Fielden. Despite the rhetoric of the so-called revenge circular, the meeting was peaceful and began to break up when police entered the square. Someone threw a bomb among the police, killing one officer outright and fatally injuring others. The police then opened fire. The bomb and the bullets killed 12 people (eight police and four civilians) and wounded at least 90 others.

The episode appeared to confirm the widespread fear of revolution. The press and a large cross section of the community demanded that radicalism be smashed. Police arrested known radicals, searched their homes, and tried to induce false testimony. As a result of this investigation eight people—Parsons, Spies, Fielden, Eugene Schwab, Adolph Fischer, George Engel, Louis Lingg, and Oscar Neebe—all anarchists, were tried and convicted.

Although the prosecution could not link them directly to the bomb throwing, the jury obeyed Judge Joseph Gary's instructions to find them guilty if it determined that they had ever advocated violence. Neebe received a 15-year sentence, and the seven others were sentenced to death. Lingg committed suicide during the appeals process, and Parsons, Spies, Engel, and Fischer were executed on November 11, 1887. Fielden and Schwab, whose death penalties were commuted to life imprisonment, were, with Neebe, pardoned in 1893 by Governor JOHN PETER ALTGELD.

**Hearn, Lafcadio** (1850–1904) *journalist, writer*

The foremost multiculturalist of his generation, Lafcadio Hearn was born on the Greek island of Leucadia on June

27, 1850. His mother was Greek, and his father was an Irish surgeon in the British army. When Hearn was two, he and his mother joined his father's relatives in Dublin. Two years later his mother returned to Greece, leaving him in the custody of his father's aunt. Grooming him to be her heir, his aunt sent him first to a Catholic school near Rouen, France, and then to St. Cuthbert's College, near Durham, England. While playing a game at that school, he was blinded in one eye when struck by a block of wood tied to the end of a rope. His constant reading made his other eye protrude in a disfiguring way.

When most of his great-aunt's money was lost by a relative, who had displaced Hearn as her heir, Hearn was sent to live with a former servant in London and in 1869 to a distant relative in Cincinnati, Ohio. After a number of jobs, including proofreading and type setting, he became a reporter for the Cincinnati *Enquirer* in 1874. The next year, when he was fired for having an affair with a biracial woman, he was hired by the Cincinnati *Commercial*. He had already gained a following for his elegant writing about gruesome crimes and his sensitive translations of French stories.

In 1877 he moved to New Orleans, where he nearly died during a yellow fever epidemic, and stayed 10 years. He did more French translations, studied Creole dialect and folkways, and found himself a cultural interpreter after he became the literary editor of the New Orleans *Times-Democrat* in 1881. Hearn published *Stray Leaves from Strange Literature* (1884), an anthology of folklore from Eskimo, Polynesian, Hindu, Jewish, Arabic, and other sources, and began placing pieces in *Harper's Bazaar* and *Harper's Weekly*.

In 1887, the year he left New Orleans, Hearn published *Some Chinese Ghosts*, six legends from Eastern sources, and arranged for his first novel, *Chita*, to be serialized in *Harper's Monthly*. Influenced by French symbolism, the novel, with its polished, lyrical prose, is Hearn's greatest work. It is a story of the 1856 New Orleans hurricane that devastated Last Isle, a resort area where couples, dancing at a ball, are swept into the storm. Among the dead in "the confusion of heaping waters," Feliu, the founder of the island's Spanish fishing settlement, sees movement and a "gleam of bright hair." He wrestles with the waves to reach the billiard table, where a four-year-old girl is tied with a silken scarf to her dead mother. Using the scarf, he binds the child to him and against all odds reaches the shore. He brings the new Chita to his wife, Carmen, who is forever burning candles before a wax Virgin with an Indian face, while she prays for a child to replace her first Chita, who died years earlier. The novel is the new Chita's story, but it is more about nature than about her. It is "rhythm, sensation, color, recurrence." It is "a succession of pieces. . . that match like a mosaic" (Kunst, 69).

Also in 1887 Hearn moved to Martinique, where he wrote sketches of native life, *Two Years in the French West Indies* (1890), and *Youma* (1890), a short novel about a slave uprising. After writing a year in New York and Philadelphia, Hearn left for the East in March 1890. His object was to write for *Harper's* a book about Japan. Continuing to live a most exotic life, Hearn wrote 12 books on Japanese culture, married Setsu Koizumi, fathered four children, was a public school and a university teacher, and became a Japanese citizen. He died in Tokyo on September 26, 1904.

—Olive Hoogenboom

***Hepburn v. Griswold*** (1870) See CURRENCY ISSUE.

**Herbert, Victor August** (1859–1924) *musician, composer*

Victor Herbert is remembered for his operettas, which enjoyed immense popularity from the 1890s through World War I. He was one of the finest cellists, conductors, and composers of his generation and was an important advocate for composers' rights.

Herbert was born on February 1, 1859, in Dublin, Ireland, the son of Edward Herbert and Fanny Lover. Edward died while Victor was still an infant, and he spent his early childhood in England at the home of his maternal grandfather, noted Irish painter, novelist, and songwriter Samuel Lover. In 1866 Herbert's mother married a German doctor, and the family settled in Stuttgart, Germany. Victor enrolled at the local gymnasium and began music studies, at first piano and flute before settling on the cello. He left the gymnasium at age 15, and from 1874 to 1876 he studied cello with Bernhard Cossmann.

In 1876 he began his professional career as a cellist, performing with orchestras throughout Europe. Around 1880 he spent a year in Vienna with the orchestra of Eduard Strauss, where he gained a familiarity with the Viennese operetta and lighter classical music that was to greatly influence his own work. In 1881 he returned to Stuttgart to play in the court orchestra; in 1883 he appeared as soloist with the orchestra in his first large-scale composition, the Suite for Cello and Orchestra, op. 3, and in 1885 he appeared as soloist in his First Cello Concerto, op. 8. During these years he studied composition with Max Seifritz at the Stuttgart Conservatory. In 1886 Herbert married Therese Forster (1861–1927), a distinguished Viennese soprano who had been engaged by the court opera in 1885.

She was offered a contract with the Metropolitan Opera Company of New York, and it was arranged that Herbert would be offered a position as first cellist with the opera orchestra. The couple sailed for New York in the autumn of 1886.

In New York, Herbert quickly became a leading figure in the musical life of the city. In addition to playing in the opera orchestra, he found work as a conductor, teacher, chamber musician, and cello soloist. In 1889 he was appointed to the faculty of the National Conservatory, where Antonín Dvořák served as director from 1892 to 1895. Although he left the conservatory in 1893, he developed a warm personal relationship with Dvořák. He was appointed director of the 22nd Regiment Band of the New York National Guard in 1893. That band, known as "Gilmore's band," was founded in 1861 by Patrick S. Gilmore and was considered one of the finest bands in the nation. The reputation of the band declined following Gilmore's death in 1892, but Herbert quickly reestablished it as a leading organization and toured widely with it for the next seven years. In 1898 he was appointed conductor of the Pittsburgh Symphony Orchestra, and he succeeded in raising it to the level of the finest American orchestras. In 1904 he founded the Victor Herbert Orchestra, which achieved national fame and popularity by performing light orchestral music.

Herbert was active and successful as a composer from his arrival in America. In 1894 he introduced his Second Cello Concerto with the New York Philharmonic. His tone poem *Hero and Leander* (1901) reflects the influence of Wagner and Liszt, yet he composed and arranged many marches and lighter works for band and orchestra. He composed two operas, *Natoma* (1911) and *Madeleine* (1914), and wrote one of the first scores for the classic full-length film *The Birth of a Nation* (1916). But it was as a composer of operettas that he had his greatest success. His first operetta, *Prince Ananias*, was produced in New York in 1894 by the Bostonians, a popular theater company. The work was only a modest success, but the following year saw the production of *The Wizard of the Nile*, the first of a string of hits that would last for the next 30 years. *The Serenade* (1897) and *The Fortune Teller* (1898) were major successes, and in 1899 he had three more shows in production on Broadway. In all, Herbert wrote more than 40 operettas, the most notable being *Babes in Toyland* (1903), *Mlle. Modiste* (1905), *The Red Mill* (1906), *Naughty Marietta* (1910), *Sweethearts* (1913), and *Eileen* (1917). These shows reflect the influence of Viennese operetta but also owe a debt to Gilbert and Sullivan and Tin Pan Alley. Many of the most popular songs of the era came from these works, including "Kiss Me Again," "Italian Street Song," "Ah, Sweet Mystery of Life," "Streets of New York," and "Because You're You."

Herbert was a leader in the fight for composers' rights. His testimony before Congress was influential in the passage of the copyright law of 1909 that secured composers' royalties on the sale of recorded cylinders, discs, and piano rolls. He was also one of the founders of the American Society of Composers, Authors, and Publishers (ASCAP), and he served as a vice president and director from 1914 until his death on May 26, 1924. He recognized the importance of sound recording and made many early recordings as a cellist and conductor.

### Higginson, Thomas Wentworth (1823–1911)

*abolitionist, reformer, writer, minister*

A radical activist, Thomas W. Higginson was born in Cambridge, Massachusetts, on December 22, 1823. A well-rounded boy who loved nature, sports, and books, he entered Harvard at the age of 13 and graduated in 1841, second in his class. Higginson taught school for two years before returning to Harvard for graduate study, primarily in the Divinity School, from which he graduated in 1847. His prospects for employment were dim. He was an abolitionist who had already in 1846 published a sonnet in praise of William Lloyd Garrison and had publicly declared that the clergy should lead in righting social wrongs.

In September 1847 Higginson married his second cousin, Mary Elizabeth Channing, and thanks to a shortage of ministers, began his pastorate at the First Religious Society of Newburyport, Massachusetts. It was a conservative Unitarian congregation, and Higginson refused to tailor his beliefs to suit its views. He denounced Northern apathy over Southern slavery and Newburyport apathy over the exploitation of workers in local cotton mills. He supported WOMEN'S RIGHTS (LUCY STONE stayed in the Higginsons' home while on a lecture tour) and opposed capital punishment. After two years his congregation asked him to resign, although he was supported by women, young men, reformers, and the poor. He remained in the Newburyport area, delivering lectures, writing newspaper articles, and increasing his social activism. In 1850 he signed the call for the Worcester, Massachusetts, Woman's Rights Convention, helped form the Boston Vigilance Committee to resist the 1850 Fugitive Slave Law, and ran unsuccessfully for Congress on the Free Soil ticket.

In spring 1852 he became the minister of the Free Church of Worcester. This time was on the same wavelength as his congregation, which allowed him to pursue his widening reform interests, which blossomed into a militant

activism. In 1853 he addressed the Massachusetts Constitutional Convention on "Woman and Her Wishes" and attended the World Temperance Convention in New York. When that organization slighted women delegates, Higginson led the delegates to another hall and formed the Whole World's Temperance Convention. Two years later he presided at the wedding of Stone and Henry Blackwell, where Stone retained her maiden name and Blackwell renounced his legal rights as husband.

Abolition remained Higginson's chief passion. In 1854 he led the Boston Vigilance Committee's unsuccessful attempt to free Anthony Burns, a fugitive slave held in the federal courthouse. After smashing down the door, Higginson and his fellows were confronted by club-wielding deputy federal marshals. Higginson got a nasty cut on his chin, and a pistol shot killed a marshal, ending the assault. Luckily, Higginson, who had not fired the shot, was indicted for riot rather than murder and was not prosecuted. "It would be good for the cause if they were to hang you," Stone suggested.

The 1854 Kansas-Nebraska Act, opening free territory to slavery, promoted violence as proslavery and anti-slavery forces clashed in Kansas in their efforts to win that state. Doing less preaching and more acting, Higginson, in 1856, became an agent of the Massachusetts Kansas Aid Committee, visited Kansas, helped arm free state people, and sent letters to the *New York Tribune*, which published them as *A Ride Through Kansas* (1856). In 1858 Higginson was one of the "Secret Six," who agreed to support John Brown's plea for help in a "most important undertaking." Unknown to Higginson, it turned out to be Brown's raid on Harpers Ferry in hopes of fomenting a slave revolt. Publicly avowing his support of Brown, Higginson in 1860 and 1861 wrote a series of sympathetic articles on slave revolts. His wife, though an invalid, fully supported his activism.

When the Civil War came in 1861, Higginson was loath to leave his wife but by 1862 had raised the 51st Massachusetts Volunteers, in which he was a captain. In November 1862 he became colonel of the 1st South Carolina Volunteers, the first of many all-black regiments in the Union army. Higginson served until May 1864, when he failed to recover from a wound. Upon his resignation he joined his wife in Newport, Rhode Island. His appreciative articles on African-American troops, who proved to be essential for Northern victory, began to appear in the *Atlantic Monthly* in 1864, and in 1870 Higginson published his classic *Army Life in a Black Regiment*.

After the war Higginson devoted himself to writing. He was primarily an essayist for the *Atlantic*, but his range was broad. He remained a reformer, concentrating on women's rights. Those interests converged in his friendship and encouragement of EMILY DICKINSON (with whom he corresponded after 1862) and HELEN HUNT JACKSON

(who moved to Newport in 1866) and in his biography of Margaret Fuller. In 1890 Higginson found a publisher for Dickinson's poems and coedited two volumes of them. He maintained his friendship with Stone and for years contributed to *Woman's Journal*, the organ of her American Woman Suffrage Association. Higginson also wrote an immensely popular *Young Folks' History of the United States* (1875).

His wife, Mary Channing, died in 1877, and two years later he married Mary Thatcher. They had two daughters. Higginson moved back to Cambridge, where he continued his literary work and maintained his interest in reform but became less militant and more pragmatic than he had been in his youth. Higginson disagreed with abolitionist friends, when in 1877 he understood the political realities that caused RUTHERFORD B. HAYES to cease using federal troops to support Republican governments in South Carolina and Louisiana. In 1884 he joined the MUGWUMPS as they bolted the REPUBLICAN PARTY to support GROVER CLEVELAND for president. Higginson was impressed by EDWARD BELLAMY's utopian socialist novel *Looking Backward* (1888) and supported the Nationalist Clubs dedicated to bringing about the egalitarian society Bellamy envisioned. Appalled that the United States had joined European powers in their race for colonies, Higginson helped found the ANTI-IMPERIALIST LEAGUE in 1898.

Higginson continued to pour out essays, was the poetry editor of the *NATION* from 1877 to 1903, and was the biographer of *Henry Wadsworth Longfellow* (1902) and *John Greenleaf Whittier* (1902). Higginson published his autobiography, *Cheerful Yesterdays*, in 1898 and remained productive until his death on May 9, 1911. An honor guard of African-American soldiers participated in his funeral.

Meyer, ed., *The Magnificent Activist: The Writings of Thomas Wentworth Higginson (1823–1911)* (New York: DaCapo Press, 2000); Brenda Wineapple, *White Heat: The Friendship of Emily Dickinson and Thomas Wentworth Higginson* (New York: Knopf, 2008).

**Hill, James J.** (1838–1916) *businessman, financier*  
James Jerome Hill, the builder of the Great Northern Railway, was born on September 16, 1838, in Rockwood, Ontario, Canada, to farmers James Hill and Alice Dunbar. James J. Hill left school at age 14 and worked as a grocery-store clerk. In 1856 he moved to St. Paul, Minnesota, where he held a variety of jobs as a clerk and agent of companies involved in river and railroad transportation. In 1866 he established his own company, specializing in the

James J. Hill (left) with J. H. Carroll (Library of Congress)

transfer and warehousing of freight, and in 1867 he contracted to supply the St. Paul & Pacific Railroad with fuel. Poorly managed, that railroad went bankrupt in 1873, and Hill, recognizing the importance of rail transportation to the future of the Northwest, acquired it in 1878 with the support of three Canadian investors. Hill extended the St. Paul & Pacific line to link St. Paul with Winnipeg, Manitoba, Canada, in 1878, and the next year he reorganized it as the St. Paul, Minneapolis & Manitoba Railway. He also built west through the Dakotas and Montana to Great Falls by 1887. In contrast to the jerry-built Northern Pacific Railroad (NP), Hill's road was carefully surveyed, well constructed, and efficiently managed. In 1890 Hill united all his railroad holdings in to the Great Northern Railway Company, a vast network that in 1893 reached Seattle, Washington, and for a time ran steamships to China and Japan.

While dedicated to the expansion of his rail empire, Hill was implacable in defending and promoting his financial interests and in eliminating competition. Hill and financier J. PIERPONT MORGAN in 1896 gained control of the NP, and in 1901 they acquired the Chicago, Burlington & Quincy Railway Company (CB&Q), thus gaining access to Chicago. Edward H. Harriman, the dominant figure in southwestern railroads, and who was backed by financier Jacob Schiff, also wanted the CB&Q and challenged Hill and Morgan for control of the NP, which had half-interest in the CB&Q. The bidding for NP stock was so intense that Wall Street was shaken, but the rivals made an uneasy peace later that year by forming the Northern Securities

Company, with Hill as president. Serving as a holding company for the Great Northern, the NP, and the CB&Q systems, the Northern Securities Company was dissolved in 1904 when the SUPREME COURT declared it to be in violation of the SHERMAN ANTITRUST ACT of 1890. Despite the Court's action, the NP remained strongly influenced by Hill. Ironically, in 1970 the Interstate Commerce Commission approved the merger of the Great Northern, NP, and the CB&Q.

Hill was widely regarded as an "empire builder." To generate traffic for the Great Northern, he promoted the settlement and development of the Northwest. He encouraged immigration, sought to improve farming methods, and by keeping freight rates and passenger fares affordable along his right of way, earned a reputation for concern for the welfare of the pioneers in the region. Hill had the clear vision to see that their prosperity was the source of the Great Northern's strength and his fortune. He died in St. Paul on May 29, 1916.

### **Hoar, George F.** (1826–1904) *politician*

Born in Concord, Massachusetts, on August 29, 1826, George Frisbie Hoar, a distinguished reform-minded U.S. senator, came from an eminent family. His grandfather Roger Sherman had signed the Declaration of Independence and the Constitution; his father Samuel was a conspicuous antislavery man driven from South Carolina by a mob in 1844; his older brother Ebenezer Rockwood was Ulysses S. Grant's attorney general; and his sister Elizabeth was noted for her brilliance among the outstanding intellectuals of their town. Hoar graduated from Harvard College and Harvard Law School, practiced in Worcester, Massachusetts, entered politics as a Free-Soiler, and joined the Republican Party in 1856. From 1856 to 1857 he worked with the free-state element in Kansas. After several years in the Massachusetts legislature, Hoar served in the U.S. House of Representatives from 1869 to 1877 and from then on in the Senate until his death in Worcester on September 30, 1904.

While always loyal to the Republican Party, Hoar neither forgot its reform origins nor his own heritage of conscientious public service. Honest, upright, decent, and forthright, Hoar had an independent streak, and when aware of wrongdoing, he would expose the misdeeds and oppose the policies of fellow Republicans if he thought

them wrong. He helped investigate the Credit Mobilier scandal (implicating the vice president and members of Congress for taking bribes), opposed the so-called Salary Grab Act (1873) (retroactively raising congressmen's salaries), and in 1876 was a manager of the impeachment of Grant's secretary of war (for selling Indian-post traderships) even after he had resigned.

Having begun his career as an antislavery reformer, Hoar consistently supported civil rights for all (the Fourteenth Amendment); voting rights for AFRICAN AMERICANS (the Fifteenth Amendment, which he thought was "the crowning measure of Reconstruction"), and for women (for which he wrote pamphlets); and the rights of Chinese immigrants and NATIVE AMERICANS. He also worked to purify politics and to improve the machinery of government. He supported the 1883 PENDLETON CIVIL SERVICE REFORM ACT, which required that civil servants be appointed on the basis of open competitive examinations, and he wrote the 1887 repeal of the Tenure of Office Act as well as the 1886 Presidential Succession Act. The growth of monopoly disturbed Hoar, who was an architect of the 1890 SHERMAN ANTITRUST ACT and who later sought to regulate corporations more effectively by licensing those engaged in interstate commerce.

In the twilight of his career Hoar denounced IMPERIALISM as contrary to the ideals of the founders of the Republican Party, the principles of the Declaration of Independence, and the morality of the Golden Rule. Urging that the United States promote self-determination, he strongly favored Cuban independence and opposed the annexation of the Philippines and Puerto Rico. The anti-imperialist crusade failed: CUBA, nominally independent, became an American protectorate; Puerto Rico became a colony; and the Philippines were conquered and annexed. Self-determination was ignored, but a generation after Hoar's death the United States found that self-determination was preferable to imperialism.

### **Homer, Winslow** (1836–1910) *painter, illustrator*

Winslow Homer is credited with originating an American vein of realism in depictions of genre scenes, the landscape, and the seascape. His was a muscular realism that celebrated the paint surface.

Born in Boston on February 24, 1836, Homer had a two-year apprenticeship with a lithographer, almost his only

*The Unruly Calf*, by Winslow Homer, 1875 (Library of Congress)

formal training. In 1857 he began supporting himself as a freelance illustrator for magazines and newspapers, work he continued for 20 years. His images of the Civil War, which focused on the soldiers' everyday camp life instead of the battlefield, received wide circulation. In 1866–67 he traveled to Paris, where he probably saw the work of early modernists such as Edouard Manet and Gustave Courbet. The color theorist Eugene Chevreul and Japanese art also influenced Homer. In the 1860s and 1870s he was an active figure in the New York art world, and his oils and watercolors found a ready market. Always an active outdoorsman, Homer chose, after 1884, to live much of his life in the relative isolation of Prout's Neck, Maine, where he died on September 29, 1910.

Homer found his first success as a painter with genre scenes expressed in a distinctly American idiom. A series depicting public education included *Snap the Whip* (1872, Butler Institute of American Art, Youngstown, Ohio), which shows boys playing that game in front of a one-room rural school house. The painting was widely exhibited and frequently engraved. Among the paintings derived from his work as a war correspondent was *Prisoners from the Front* (1866, Metropolitan Museum of Art, New York), which

depicts a young Union officer inspecting three Confederate captives, the dress, posture, and facial expressions of each conveying their rank and character. A decade later Homer revisited the South and perceptively painted recently freed slaves at work, *The Cotton Pickers* (1876, Los Angeles County Museum of Art), and at leisure, *Sunday Morning in Virginia* (1877, Cincinnati Art Museum).

Homer often turned his attraction to dramatic landscapes and dramatic events in the landscape rendered dispassionately. He painted the sporting life in the Adirondacks: deer frantically swimming away from hunters, a fighting trout at the end of a line, and the rugged guides who made such scenes accessible to Homer and his patrons. Winters spent in Bermuda, Florida, and other warm places resulted in vivid watercolors. Some of his oils distill these outdoor experiences; for example, in *The Fox Hunt* (1893, Pennsylvania Academy of the Fine Arts, Philadelphia), two crows and their quarry, a fox, are silhouetted against the snow; the canvas quotes Japanese prints as well as real life.

Homer is perhaps most well known for his seascapes. Many earlier genre scenes included the water; for example, *Breezing Up* (1876, National Gallery of Art, Washington, D.C.), shows a group on a small sloop experiencing the

exhilaration of a sail full of wind. From a 20-month stay in Cullercoats on the North Sea coast in England came many iconic depictions of fisherwomen and the sea. As time went on, his seascapes became stripped down to depictions of waves, rocks, and sky. Although works such as *Northeaster* (1895, Metropolitan Museum of Art, New York) fit comfortably into an international vogue for marine painting, Homer's paintings were seen as being especially American in their vigor.

### homesteading

The effect of the Homestead Act, which gave settlers free farms under certain conditions, has been exaggerated. After years of agitation, the Homestead Act passed CONGRESS on May 20, 1862. It provided that any American citizen or alien 21 years of age who filed papers declaring his or her intent to become a citizen could settle on 160 acres (a quarter of a section) of public land and, after residing on and cultivating it for five years, would gain title to that land. Since a married couple could only obtain 160 acres and a single man and a single woman could each obtain 160 acres, some delayed marriage and lived in a home straddling the dividing line of their adjoining properties.

Advocates of the Homestead Act hoped it would provide homes in the West for poor urban laborers and tenant farmers in the East. They were disappointed; it did not provide relief for the needy. Most of the land available for homesteads was located west of the Mississippi, and the cost of moving a family hundreds or thousands of miles was prohibitive for workers and tenants who could hardly provide for their families and had no savings. Once on the land, shelter had to be built, draft animals and implements had to be acquired, and two or three years of "sod busting" had to be done before the land would yield crops sufficient to support a family. On top of these difficulties, most urban workers knew nothing about farming, and much of the available land was arid and suitable only for grazing. To raise cattle successfully, 160 acres was entirely too small. Younger sons of middle-income farmers were better equipped to succeed at homesteading, but even they found it difficult; before 1890 two-thirds of all homesteaders failed.

The overwhelming majority of settlers purchased their land from either RAILROADS or land speculators, because they owned the land most fertile and closest to transportation. Railroads had received huge land grants to encourage their construction in sparsely settled areas and had grabbed the best land, while speculators using dummy settlers took

advantage of loopholes in the Homestead Act and engrossed large amounts of desirable land. Probably only one-eighth and possibly only one-tenth of the family farms established from 1870 to 1900 were acquired by genuine settlers under the terms of the Homestead Act. The cost of land was not exorbitant: Since the railroads wanted settlers producing freight along their right of way, they sold their land relatively cheaply, and land speculators to remain competitive did the same. Given the expense of establishing a farm, it made economic sense to buy productive land rather than cultivate poor, albeit free, land. Nevertheless, the dream of providing free farms to settlers was largely frustrated while land speculators and railroads made a profit.

### Homestead Strike (1892)

The Homestead Strike, or technically lockout, was a struggle between the most powerful union in the AMERICAN FEDERATION OF LABOR (AFL) and Carnegie Steel, one of the largest enterprises in America. When ANDREW CARNEGIE purchased the Homestead Mill in 1889, he attempted to lower costs by announcing a 25 percent decrease in wages, but the Amalgamated Association of Iron, Steel and Tin Workers forced him to rescind the pay cut and sign a three-year contract. Since Carnegie was not one to share control of the workplace, it was a pyrrhic victory for the Amalgamated.

In 1892 Carnegie instructed his chairman, HENRY C. FRICK, to remove the union from Homestead. Frick prepared for a confrontation with the union by increasing production and constructing a 12-foot-high stockade around the plant. In April, Frick demanded that the union accept a 22 percent cut in wages and gave the union until June 24 to accept his terms. On June 9, the day before the contract expired, he closed the mill.

To keep the company from replacing its members, the Amalgamated organized a 24-hour watch to prevent anyone from entering the plant. Frick asked local authorities to protect company property, but finding little sympathy in the community, he turned to outside support. On July 6, a steamer towed two barges containing 300 armed Pinkerton detectives from Pittsburgh up the Monongahela River toward Homestead. Despite efforts at secrecy, strikers and their sympathizers knew the PINKERTONS were coming. The strikers, most carrying weapons, broke through the stockade around the plant and were on hand at the landing near the pump house when the barges arrived. A shot followed by a volley killed one detective and wounded five as they attempted to disembark. The Pinkertons returned the

fire, killing three and wounding 30. The battle continued sporadically throughout the day, claiming a total of 16 dead and 60 wounded. Finally the Pinkertons surrendered, and an angry crowd assaulted them as they were marched to the railroad station.

Although peace returned to Homestead after the battle, Governor Robert Pattison ordered the Pennsylvania National Guard into the steel community. Under the command of General George Snowden, the troops protected strikebreakers and allowed the plant to reopen. Public opinion at first was solidly aligned against Carnegie Steel, but the bungled attempted assassination of Frick on July 23 by anarchist Alexander Berkman eroded this support. Nevertheless the union continued its fight until November 20, when, with its treasury exhausted and its stockpile of supplies depleted, the Amalgamated called off the strike. Carnegie Steel, however, rehired only a few of the strikers and blacklisted their leaders. The defeat at Homestead virtually eliminated effective trade unionism in the steel industry for more than 40 years.

### Hooker, Isabella Beecher (1822–1907) *women's rights activist*

Isabella Beecher Hooker was a radical, eccentric suffragist. Born on February 22, 1822, in Litchfield, Connecticut, Hooker was the daughter of the distinguished Calvinist minister Lyman Beecher, and she was the half sister of HENRY WARD BEECHER, the preacher; Catharine Beecher, the educator; and Harriet Beecher Stowe, the author. Educated largely in schools founded by Catharine, Isabella in 1841 married John Hooker, a lawyer, but having observed the “radical defect” in the marriages of her brothers, she did so with the understanding that she and John would be partners. They ultimately settled in Hartford, prospered, and raised three children. Although she desired domestic equality, Isabella Hooker was not attracted to the WOMEN'S RIGHTS movement until the 1860s, when she read the English philosopher John Stuart Mill on the enfranchisement of women.

Hooker, who had longed for some kind of significant public activity, found her avocation. She met SUSAN B. ANTHONY and Elizabeth Cady Stanton and in 1868 joined OLYMPIA BROWN in establishing the New England Woman Suffrage Association. In that same year she published “A Mother's Letters to a Daughter on Woman's Suffrage” in

*Putnam's Magazine*. In 1869 Hooker joined the National Woman's Suffrage Association (NWSA) and was the chief organizer of the Connecticut Woman Suffrage Association. John Hooker, with the support of Isabella, drafted a married-woman's property bill that in 1870 was introduced in the Connecticut state legislature; the Hookers lobbied vigorously for the bill until it passed in 1877. Isabella Hooker played a prominent role in NWSA meetings, testified at congressional hearings, and also published arguments for women's rights, including *Womanhood: Its Sanctities and Fidelities* (1873). Drawing upon her own life, Hooker argued that a woman's job supervising children and running a household gave her ample experience to participate in government.

Hooker had radical and bizarre ideas. Her preacher relatives were not happy that she agreed with Anthony and Stanton that marriage and divorce laws needed reform to give women equal rights. Her Beecher relations were made even more unhappy by Hooker's support of VICTORIA WOODHULL, a suffragist, spiritualist, and an adventurer whom she befriended after Woodhull addressed the January 1871 Washington Convention that Hooker had organized. In November 1872 Woodhull published in *Woodhull and Claflin's Weekly* the scandalous tale of Henry Ward Beecher's adulterous affair with a parishioner, Elizabeth Tilton. While the Beechers supported Henry, Hooker was the exception and was ostracized by her family. She obviously thought him guilty and deplored the double standard that exonerated her brother. The Beechers, for their part, accused her of mental instability.

The alienation and accusations of her family took their toll on Hooker. In 1874 she and John went to Europe for two years, and they found some solace in spiritualism, to which Woodhull had introduced them. Upon her return in 1876 she got the idea that she was destined to lead a matriarchal government of the United States and then of the world. With local Hartford mediums present on New Year's Eve 1876, she expected to receive the call, but it did not come. Hooker abandoned her fantastic notion (but not spiritualism) and continued to work for women's rights. After the National American Woman Suffrage Association (NAWSA) (1890) emphasized state campaigns, she backed Olympia Brown's Federal Suffrage Association (1892), but her activities tapered off. She died in Hartford on January 25, 1907.

### Hoosac Tunnel

The Hoosac Tunnel, one of the great engineering feats of the 19th century, had its inception in the early years of what

the historian George Rogers Taylor has called the “transportation revolution.” The westward movement across the Appalachians after the War of 1812 created a demand for easier and faster transport of people and goods to the Ohio Valley and other points west. In 1819 a canal tunnel was proposed to run under the Berkshire Mountain Range, 136 miles west of Boston. In 1826, soon after the Erie Canal opened in New York, surveys were made for the Berkshire canal. However, plans changed when the RAILROAD age began in the 1830s. In 1848 the Troy & Greenfield Railroad was chartered, and in 1850 surveys were made for a railroad tunnel.

Work began in 1851 on what would be known as the Hoosac Tunnel. It was finally completed in 1874, and the first train passed through in the following year. The statistics were staggering for that period. The tunnel ran for four and three quarter miles and cost, in 1874 dollars, \$21,241,342. The rock excavation was 24 feet wide and 20 feet high, requiring the removal of 2 million tons of rock. Half a million pounds of nitroglycerin were used, the first commercial use of that powerful and unstable explosive. Giovanni Battista Piatti, an Italian inventor, devised the rock drill, in which steam or compressed air powered a hammer tool to drill holes for the explosive. The pneumatic drill was used for the Mont Cenis tunnel in the Swiss Alps, eight and a half miles long, which when opened in 1871 was the longest tunnel in the world. It was also used in the Hoosac Tunnel, which became the second longest tunnel in the world when it opened and remained the longest tunnel in North America until 1916. It is still the longest tunnel east of the Rocky Mountains.

The Hoosac Tunnel cost more than sweat and dollars. Its toll in lives has been variously estimated but appears to have approached 200. The chief causes of death among construction workers were “tunnel sickness” due to heat, foul air, explosives, and rock falls. But in the 19th century such deaths were accepted as the unavoidable price of progress.

—Robert V. Bruce

## horse racing

During the 1860s, several newly made millionaires revived the sport of horse racing. The troubled sport had been on the verge of collapse for the previous two decades because of inconsistent patronage from the nation’s wealthiest classes, national economic problems, and charges of gambling, chicanery, and commercialism. Wealthy patrons,

however, ushered horse racing into a new golden age, building new tracks, providing large stakes, reducing corruption, and shortening racing distances. John Morrissey, a former boxing champion and TAMMANY HALL politician, opened a racetrack at Saratoga Springs, New York, in August 1863 and persuaded New York socialites Leonard Jerome, the American grandfather of Sir Winston Churchill, and William Travers to join him in the venture. He earned considerable profits with an extensive August racing season that attracted notables. Previously, race meetings usually had lasted just one or two days. Morrissey arranged the first stakes races, named after the aristocratic Travers family, and offered generous purse money.

In 1866 Leonard Jerome, enlisting the support of Travers, August Belmont, and other wealthy New Yorkers, founded the American Jockey Club as a central governing board. The American Jockey Club reestablished racing on a firm basis in New York, building Jerome Park on more than 200 acres of land in Westchester County. The nation’s most lavish course, it contained a luxurious clubhouse, barred the sale of liquor, and discouraged professional gamblers. The Belmont Stakes, the oldest of the Triple Crown races, was held at Jerome Park from 1867 to 1888 and shifted to Morris Park in 1889. Ruthless, ridden by J. Gilpatrick, captured the first Belmont Stakes in 1867. Jim McLaughlin rode six Belmont Stakes winners between 1882 and 1888, missing only in 1885. Morris Park opened in August 1889 and sponsored races through 1904. The American Jockey Club, whose wealth and social status extended well beyond New York City, led the movement to replace the old three- or four-mile heats with shorter dashes that emphasized speed over stamina and permitted the running of several daily races. The Travers Stakes, Belmont Stakes, and other large permanent prizes brought greater excitement and stability to horse racing.

Racetracks were built in 1870 at Monmouth Park in New Jersey and at Pimlico in Baltimore, Maryland; in 1873 at the Fair Grounds in New Orleans, Louisiana; and in 1875 at Churchill Downs in Louisville, Kentucky. The Preakness Stakes at Pimlico and the Kentucky Derby at Churchill Downs soon joined the Belmont Stakes as Triple Crown races. George Barbee triumphed aboard Survivor in the inaugural Preakness Stakes in 1873 and aboard Shirley in 1876, while Lloyd Hughes rode three Preakness winners in 1875, 1879, and 1880. In 1875 Oliver Lewis captured the initial Kentucky Derby aboard Aristides for a \$2,850 prize. Isaac Murphy, a black jockey, rode three Kentucky Derby winners: Buchanan in 1884, Riley in 1890, and Kingman in 1891. Willie Simms followed suit with Ben Brush in 1896 and Plaudit in 1898. Other tracks opened in Chicago, Cincinnati, Memphis, Boston, and Springfield, Massachusetts, and more Thoroughbreds were imported from England.

Murphy and Edward “Snapper” Garrison were the era’s most dominant jockeys. In addition to his three Kentucky Derby wins, Murphy in June 1890 guided Salvator to a half-head victory over Garrison’s Tenny at Sheepshead Bay in Brooklyn, New York, in a widely publicized, exciting race. Murphy rode nearly every famous American horse and triumphed in every major race except the Futurity Stakes at Belmont Park, compiling 628 victories in 1,412 mounts. Garrison, one of the first jockeys to use the short stirrups and monkey crouch, usually lagged behind and then thrilled crowds with spectacular, breathtaking finishes. From 1880 to 1896, he won more than \$2 million in nearly 700 races.

Racing lacked national governing control until the 1890s, with each racing association operating under its own rules. The Jockey Club, incorporated by 50 industrial and financial giants in February 1894 and headquartered in New York, adopted uniform national racing rules, appointed officials, licensed jockeys, and set national racing dates. Bookmakers from Great Britain made their first appearance on American tracks in 1873 and broadened gambling to the small-time bettor. At that time, bookmaking was the only form of wagering allowed on New York tracks. Horse-racing authorities turned to machine politicians in New York, New Orleans, Chicago, and elsewhere to obtain the repeal (or exemption from enforcement) of laws restricting racing and gambling. Political leaders in New York and other horse-racing centers were willing to help and maintained close connections with track officials.

P. Robertson, *The History of Thoroughbred Racing in America* (Englewood Cliffs, N.J.: Prentice Hall, 1964).

—David L. Porter

## housing

The major housing need between 1870 and 1900 was simply to provide dwellings for the nation’s exploding population, which doubled from 38.6 to 76 million. This task was particularly challenging in cities, since the urban population more than tripled, from 9.9 to 30.2 million, during these years. In these three decades 6.4 million new urban housing units were built for 20.3 million new urban residents, a ratio of 3.2 new residents per new unit. By way of comparison, nationwide there were five persons per dwelling unit in 1890 and 4.8 in 1900. Between 1880 and 1900 the number of dwellings increased at a faster rate than the number of inhabitants in 18 of the 28 largest cities.

Housing came in a wide variety of types, sizes, configurations, and materials. The diverse housing stock comprised millionaires’ mansions along Cleveland’s Euclid Avenue and on Beacon Hill in Boston, as well as lavish suburban estates far from urban congestion and pollution; sharecroppers’ shacks in the rural South; tenements in New York City; apartments above commercial buildings everywhere; balloon-frame, wooden two- and three-story houses in new subdivisions on city outskirts; wooden upstairs-downstairs duplexes in midwestern industrial cities; and the endless streets of brick rowhouses—three- and four-story narrow, attached single-family residences—in Baltimore and Philadelphia.

The single-family residence was the norm not only in rural and small-town settings but also in the nation’s large cities. In 1890 at least 75 percent of the housing stock in two-thirds of the 28 largest cities was single family; in Denver, Indianapolis, New Orleans, Omaha, Philadelphia, and San Francisco, single-family residences constituted more than 90 percent of total dwellings. Only in New York City did single-family houses comprise less than half of the dwellings.

Home ownership was an important goal for many households, both as a form of investment and as a means of gaining greater control over a family’s housing destiny and higher status. Housing tenure was first measured systematically in the census of 1890, so earlier estimates are somewhat episodic. Both the 1890 and 1900 censuses showed national ownership rates of 47 percent. In these years there was a substantial gap between ownership in rural and urban areas: The rural rate was 65 percent ownership, as compared with only 37 percent in urban areas, which also had widely varying ownership rates.

Obtaining financing was a major obstacle to purchasing one’s own house, especially in urban areas. Despite

Homes of the poorer classes, Chattanooga, Tennessee (Library of Congress)

the growth of building and loan associations, individuals still accounted for more than half of all home loans in the last decade of the century, and land contracts were more prevalent than mortgages. Repayment schemes were not well developed, so buying homes required large down payments and short mortgages or contracts. Most borrowers made regular payments only on the interest, so they had to repay the entire loan at the end of the two-to-three-year contract, which meant they had to obtain a new loan and hopefully, but not always, reduce the amount of the loan. Under these conditions, home lending was a risky business and less attractive to lenders than loans for rental properties, a factor that increased the costs and risks for home buyers.

While the increase in quantity of new housing exceeded the increase in population, the quality of that housing was uneven at best. The poignant, stark photographs of immigrant families in New York City by JACOB A. RIIS published in the mid-1880s and his classic book *How the Other Half Lives* (1890) constitute the most enduring and widespread images of housing in late 19th-century urban America, leaving the impression that all immigrants and working-class city dwellers lived in dark, windowless, airless, unsanitary, overcrowded, tiny tenement apartments. However, outside New York City most working-class city dwellers lived in single-family houses at much lower densities. But in all cities shoddy construction resulted in inferior dwelling units. Primitive technology and the enormous expense of providing infrastructure for explosive urban growth created neighborhoods with few amenities, many liberally strewn with animal and human refuse and with streets that became quagmires and virtual cesspools when it rained.

Reformers, especially ALFRED TREDWAY WHITE, linked the problem of housing to the problem of slums. Working with SETTLEMENT HOUSE children in Brooklyn, New York, White found that defective sewers and crowded tenements were at the root of most health and social problems. Convinced that it was “better to build homes which will prevent” disease than hospitals to cure it, he studied low-income housing in London. Starting in 1877 and continuing through the century, White built in Brooklyn the world’s most advanced housing for working families. Although New York City, Boston, and Milwaukee had established codes with minimum standards for space, light, direct access, and plumbing since the late 1860s, these codes were considered too costly and seldom enforced. Making his slogan “Philanthropy and five percent” a reality, White proved that good housing rented to those of limited means could be profitable. His housing and the publicity he gave it inspired Riis’s classic book and helped enact the New York State tenement legislation of 1895. Showing other late 19th-century housing reformers the way, White

became a leading member of the New York State Tenement House Commission, bringing stronger regulations in all cities, patterned on the landmark New York Tenement House Law of 1901.

### **Howells, William Dean** (1837–1920) *writer*

A leading realistic novelist of the Gilded Age, William Dean Howells was also its most distinguished literary critic. The son of Mary Dean and William Cooper Howells, a printer and journalist, William Dean Howells was born on March 1, 1837, in Martin’s Ferry, Ohio, but his family moved to Hamilton, 20 miles from Cincinnati, when he was three. His father was an idealistic, abolitionist editor of a Whig newspaper who sacrificed the family’s prosperity for his egalitarian radicalism. Young Howells had almost no formal education and was working as a typesetter in his father’s shop by the age of nine. The family moved repeatedly as the elder Howells tried to restore his fortunes with a variety of unsuccessful newspapers, and at the age of 19 Howells began reporting on the state legislature for a Cincinnati paper. Two years later, in 1858, he became editor of the *Ohio State Journal* at Columbus. In 1860 his campaign biography of Abraham Lincoln earned him enough to visit the cultural center of the country, Boston. There he met such luminaries as Ralph Waldo Emerson, Nathaniel Hawthorne, and James Russell Lowell. Howells’s biography impressed the newly elected Lincoln enough to bring him an appointment as consul at Venice, a post he held from 1861 to 1865. In 1862 he married Elinor Mead, a gifted artist, with whom he had three children. Within a year of his return to Boston, he joined the staff of the *Atlantic Monthly*, of which he became editor in 1871. During his ten years in that position, his essays made him one of the most influential critics in the country, and he published six novels of his own, developing a distinctive literary voice of objective psychological and social realism.

With his seventh novel, *A Modern Instance* (1882), Howells emerged as the leader of the realistic school in America, portraying the average American with sensitivity to the interaction of character and social conditions. His best-known work, *The Rise of Silas Lapham*, published four years later, wittily contrasts the Boston aristocracy of Beacon Hill with a self-made man who tries to rise in genteel society, loses his fortune, and rises above his defeat by strength of character. In *Lapham*, Howells created a classic American type, his vulgarity and pushiness offset by his scrupulous moral rectitude. In *A Hazard of New Fortunes* (1890), Howells examined the effect of industrialism on the common person and demonstrated his growing engagement with social issues. Influenced by Leo Tolstoy, he dealt increasingly with issues of poverty and suffering and the need for more humane values in the capitalist age. He became one of literature's leading voices for liberal causes, taking a courageous stand for the anarchists condemned as a result of the HAYMARKET RIOT of 1886, helping found the National Association for the Advancement of Colored People (NAACP) in 1909, and supporting labor in the PULLMAN STRIKE of 1894.

Howells wrote the Editor's Study column for *Harper's Monthly* from 1886 to 1891 and the Editor's Easy Chair from 1900 until his death. A forum for his socialist ideas and modernist literary opinions, these influential posts enabled him to promote the reputations of EMILY DICKINSON and his close friend HENRY JAMES, introduce the work of several Russian novelists to America, and encourage such emerging realist writers as HAMLIN GARLAND, STEPHEN CRANE, and Theodore Dreiser. Much honored in his later years, he became known as the dean of American letters. He was the president of the American Academy of Arts and Letters from its founding in 1904 until his death on May 11, 1920.

**Hunt, Richard Morris** See ART AND ARCHITECTURE.

**Hunt, William Morris** See PAINTING.

**Huntington, Collis Potter** (1821–1900) *businessman, financier*

Railroad builder and financier, Collis P. Huntington was born in Harwinton, Connecticut, on October 22, 1821. His meager education ended when he was 13 (he later

suggested that if he had had a liberal education he might not have learned to work), and at 14 he supported himself by working on a neighbor's farm for his board and \$7 a month. Having saved all he earned, Huntington went to New York in 1836 and the following year began peddling clocks and watches, primarily in the southern countryside. In 1842 he and his brother Solon opened a hardware store in Oneonta, New York, which in a few years became the largest business in Otsego County. Peddling and stocking a store honed Huntington's bargaining skills. He married Elizabeth T. Stoddard on September 16, 1844, and adopted her niece Clara, having no children of his own.

In 1849 Huntington joined the California gold rush with trading goods, including casks of whiskey. Stuck in Panama for three months before securing passage to San Francisco, he began trading his goods and parlayed his capital from \$1,200 to \$5,000. After a day of mining he decided that supplying miners' needs was more congenial and profitable. Although he set up trading posts, he soon concentrated on a hardware business in Sacramento. When a fire destroyed his shop and that of a competitor, Mark Hopkins, they formed Huntington and Hopkins Hardware and thanks largely to Huntington's savvy prospered in California's speculative business environment.

Ironically, political, rather than economic, turmoil gave Huntington his great opportunity. In 1854 the issue of slavery extension into the territories broke up the Whig Party and led to the formation of the Republican Party. Along with Leland Stanford and Charles Crocker, a fellow merchant, Huntington and Hopkins founded the California Republican Party, and Stanford became governor in 1861. The political clout of the Big Four (as they were later called), enhanced by the Abraham Lincoln administration's anxiety to bind California to the Union in the Civil War, coincided with their backing of the feasible proposal by Theodore D. Judah, a brilliant engineer, for a RAILROAD through the formidable Sierra Nevada, connecting California with the East. The Big Four financed a survey of Judah's route and incorporated the Central Pacific Railroad (CP) in 1861. Abetted by Huntington and Stanford, Judah went to Washington, D.C., to lobby for a federal subsidy for their proposed railroad and succeeded with the Pacific Railway Act (1862, amended 1864), generously supporting the CP's building east and the Union Pacific's (UP) building west from Omaha, Nebraska. Although Judah conceived the railroad and was primarily responsible for securing federal aid, Huntington disliked him. The dissension, which had developed among rival parties within the CP organization, ended in 1863, when Judah died.

The Big Four energetically pushed construction of the CP. Huntington, their strategist, moved to New York to secure financing for a risky undertaking and to purchase and ship tons of rails and other supplies around Cape Horn

to California. Crocker supervised the actual construction of the road by 2,000 Chinese laborers, wielding picks and shovels and aided by blasting powder, through the Sierra Nevada. Hopkins kept the books, while Stanford, as governor and later as U.S. senator, looked after the road's political interests. The Big Four profited exorbitantly from building the road, which in May 1869 linked up with the UP near Ogden, Utah. The construction company they owned and whose records they destroyed, built in 1867, for example, more than 550 miles of the road and apparently charged the more broadly owned CP double construction costs. The Big Four had cheated both the minority CP stockholders and the federal government.

While building east, the Big Four, led by Huntington, moved to consolidate their position in California by acquiring small railroads around San Francisco and extending the Southern Pacific (SP) south to Los Angeles. In the early 1870s Huntington feared that THOMAS ALEXANDER SCOTT, of the Pennsylvania Railroad, who had in 1872 gained control of the Texas & Pacific (T&P) would extend it through El Paso westward into southern California. Huntington succeeded in stopping Scott at El Paso by combining unsavory lobbying (bribing congressmen, for example) with audacious actions. He secured for the SP the right to build to Yuma, Arizona, to meet and stop the T&P there, and then, while federal authorities hesitated between his and Scott's claims, to build east to El Paso and ultimately to New Orleans, seizing the right of way. By 1887 the SP had been extended north to Oregon, and the "Octopus," as it was called, had California in its grip.

Although renowned as the leading figure of the Big Four, Huntington also developed a major railroad in the East and temporarily created a true transcontinental railroad from coast to coast. In 1869 he became president of

the Chesapeake and Ohio Railroad (C&O) and supervised its expansion westward to Cincinnati, Ohio, and established its eastern terminus at Newport News, Virginia. Through a holding company in the mid-1880s he secured connections between the C&O at Cincinnati and the SP at New Orleans and achieved a transcontinental railroad until the holding company went bankrupt in 1888. With his California colleagues not interested in his ambitions for a coast-to-coast railroad, Huntington that same year sold his holdings in the C&O.

Huntington's wife died in 1883, and on July 12, 1884, he married Arabella Duval Yarrington Worsham and adopted her son, Archer. In 1889 his adopted daughter, Clara, married a German nobleman, who turned out to be far from noble.

Huntington, who died on August 13, 1900, was a hard-driving, shrewd, risk-taking businessman. His energy was phenomenal, his courage great, and his judgment sound. He was also vindictive, duplicitous, and corrupt. Although public funds helped build his enterprises, which were public carriers, he did not feel obliged to the public. He was a robber baron as well as an industrial statesman. Despite his shortcomings, Huntington was primarily responsible for creating the SP as one of the world's greatest railroad systems.

### illustration, photography, and the graphic arts

In their daily lives, Americans at the end of the 19th century encountered more images than any other culture had yet experienced. Trends converged to produce an explosive growth in illustrated media of all types: America's rising population became increasingly literate. The introduction of a second-class postal rate and improved railroad networks meant faster and wider distribution of printed goods. America's expanding manufacturing capabilities spawned a consumer economy buoyed by mass communication, especially ADVERTISING. Images captured attention and conveyed information, and they were put to the service of this new economy. Newly minted professionals—commercial artists, illustrators, photographers, and graphic designers—supplied these images.

In the 1880s and 1890s, important advances were made in the technologies used for the mass reproduction of images. By 1876 the Webb press could print 15,000 large-format sheets per hour, and Mergenthaler's linotype machine, in use at the *New York Tribune* by 1886, was one of several devices that mechanized typesetting. Wood engraving, the staple of the illustrated media at mid-century, was supplanted by various methods of photoengraving, especially the halftone. By this process any image could be photographed through a screen that converted it into a set of dots that were then transferred mechanically, via acid, to a printing plate. Although printing plates were often improved by hand, the halftone process eliminated the need for large corps of engravers. Professional photographers flourished as the dry-plate process, accessory lenses, and handheld cameras made photography less cumbersome and complex. Amateur photography boomed after 1888 when the Kodak camera was introduced, with its slogan "you push the button and we do the rest." Chromolithography, used for color images, became more industrialized and less costly. In short, the production of images became a profession separate from the production of other printed matter, and images could be created much faster and at a much lower cost.

A wide variety of media incorporated images. In 1865, 700 periodicals were published in America, but by 1900 the number was 5,000. Illustrated MAGAZINES and NEWSPAPERS were published daily, weekly, and monthly and were aimed at the most general and the most specialized audiences. Among those that owed their success to their illustrations were *Scribner's*, *Century*, *Harper's Weekly*, *Leslie's Weekly*, *Ladies' Home Journal*, *Popular Science*, and *Life*. Publishing conglomerates were formed; Harper's, for example, published four major magazines in addition to their books. Novels and children's books were commonly illustrated. Advertising and promotional media proliferated, and trade cards, posters, and packaging were often produced in vivid color chromolithography. Illustration pervaded every aspect of life through ephemeral and miscellaneous materials such as sheet-MUSIC covers, stock certificates, wallpapers, billheads, and receipts. Portrait photography came within the reach of most households. Large photographic companies commissioned depictions of subjects of public interest: foreign countries, the American West, celebrities, and newsworthy events such as world's fairs. These images were published as stereographs, cabinet cards, and in portfolios that were commonly sold through bookstores. With the improved printing methods, photography in magazines, newspapers, and reports also became commonplace.

All these images were supplied by artists who often straddled the worlds of fine art and commercial art. Prominent painters, among them Edwin Austin Abbey, Howard Pyle, and FREDERIC REMINGTON, also produced oils intended as book and magazine illustrations. The Gibson Girl, introduced in 1890, became a vehicle for social synopsis, and its creator, Charles Dana Gibson, was a celebrated art editor, publisher, and painter.

Illustrations could be a force for social change; JACOB RIIS's photographs of slum images in *How the Other Half Lives* (1890) prompted housing reform. In 1878 Eadweard Muybridge first used stop-action photography to document

a horse trotting, and his continued work advanced the scientific study of animal and human locomotion. Mainly, though, illustration illuminated or decorated. Will Bradley introduced the art nouveau style to American audiences through his posters and magazine covers. While fine engravings produced in limited editions by JAMES MCNEILL WHISTLER, WILLIAM MERRITT CHASE, and MARY CASATT entered the collections of connoisseurs, high-quality chromolithographs, such as William Michael Harnett's *The Old Violin* and Daniel Ridgway Knight's *Hailing the Ferry*, decorated middle-class houses.

Editors and publishers, such as Charles Parsons at *Harper's*, Cyrus H. K. Curtis of the *Ladies' Home Journal*, and Louis Prang, maker of chromolithographs and greeting cards, shaped America's visual culture.

The history of American late-19th-century illustration is still largely unwritten. Because so many artists worked freelance and anonymously, their accomplishments remain untraceable except through the initials they incorporated within their illustrations.

## immigration

The United States is a nation of immigrants and their children. From the earliest migrants who walked from Asia over an isthmus at what is now the Bering Strait many thousand years ago, peoples have come to America in waves. The main flow of immigration to the United States in 1870 has come to be known as the “Old Immigration,” and it began just after the Napoleonic Wars. Between 1820 and 1880 more than 10 million immigrants entered the country. More than 90 percent of the newcomers were from northern and western Europe: England, Scotland, Wales, Ireland, Germany, Holland, and Scandinavia, with Irish and German migrants predominating. The remainder came from eastern and southern Europe, China, Japan, and the Americas. In 1870, for example, out of 387,000 immigrants, 329,000 came from Europe, and of those, 118,000 came from Germany, 104,000 from Great Britain, 57,000 from Ireland, 31,000 from Scandinavia, 9,000 from other northwestern European countries, and a mere 10,000 immigrated to the United States from the

remaining central, eastern, and southern European countries. The number of emigrants from Ireland had dropped considerably from 221,000 in 1851, and those from Scandinavia had risen dramatically from the 2,000 to 3,000 that came in the 1850s.

Virtually all of the 1870 immigrants were from rural areas, where most owned little or no land and lived in poverty, and almost all were lured to the United States by cheap land and a dynamic economy. The Irish were among the poorest immigrants and settled mostly in northeastern cities such as Boston and New York City, formed tight-knit communities, and supported the political machines associated with the DEMOCRATIC PARTY in those cities. Although a large number of middle-class German intellectuals migrated to America following the failure of the liberal revolutions of 1848, by 1870 the typical German immigrant was a small farmer or skilled artisan seeking improved economic conditions. Many of the German arrivals came with enough money to move to the Midwest, where they purchased land and established farms or opened businesses in cities such as Chicago, Milwaukee, Cincinnati, and St. Louis. Those who arrived with skills quickly found work as craftsmen. Like the Irish in the Northeast, those Germans who settled in the cities of the Midwest formed their own ethnic communities and gave their support to the Democrats. Scandinavians tended to settle on farms in Minnesota, the Dakotas, and Nebraska, although many found employment as skilled carpenters. Migrants from Great Britain (England, Scotland, and Wales) usually carried skills with them and found work in industry. Welsh coal miners, for example, settled in the anthracite regions of Pennsylvania.

Approximately 70 percent of all immigrants arriving in America landed in New York City. Until the early 1890s immigrants at New York were processed at Castle Garden at the foot of Manhattan Island, but in 1892 the federal Bureau of Immigration established Ellis Island in New York harbor as a new point of entry for immigrants. At Ellis Island, federal medical and nonmedical immigration officials enforced the minimal restrictions on immigration and turned back paupers, criminals, polygamists, the mentally deficient, the contagiously ill, and contract laborers. From 1864 to 1885 these laborers—who agreed to a maximum of one year's work in return for passage to the United States—were admitted, but CONGRESS, which had originally authorized the practice of CONTRACT LABOR, forbade it in 1885. Only about 2 percent of those who wished to enter were turned back at Ellis Island. Officials recorded the names of those who passed, made sure they paid an entry tax, and put them on the ferry that landed them at the lower tip of New York City. As at Ellis Island, federal inspectors operated landing stations in Boston, Philadelphia, and Baltimore on the east coast, New Orleans in the South, and on Angel Island in San Francisco.

By 1900 sufficient changes among newcomers had occurred to speak of a “New Immigration.” In that year 449,000 persons immigrated to the United States, of whom 425,000 were from Europe. However, compared with 1870, there was a sharp drop in immigrants from northern and western Europe and a spectacular rise in those who came from eastern, central, and southern Europe. Emigrants from Germany fell to 19,000, from Great Britain to 13,000, and from Ireland to 36,000, but almost the same number—a bit more than 31,000—came from Scandinavia. Those from other northwestern European countries fell to 6,000. In contrast, 98,000 came from eastern Europe, 115,000 from central Europe, and 108,000 from southern Europe.

These new immigrants were pushed from their homelands and pulled to the United States. Several forces drove these immigrants from their homes: the undermining of subsistence farming by commercial agriculture; the shift away from household production because of industrialization; the steady growth in population that brought a shortage of available farmland; oppressive taxes; famine and

disease; and religious and political persecution. America’s growing economy and its demand for workers held great promise for the new immigrants. With the exception of those from eastern Europe, virtually all of the immigrants in 1900 came to the United States to better their economic position, and some would return to their homelands having earned enough to buy land, houses, or set up businesses. Most of the immigrants from eastern Europe were Jews fleeing persecution (pogroms) in the Russian Empire.

The decision to migrate often occurred through social networks of people linked by kinship, place of residence, friendship, and work experience. These “migration chains,” extending from one’s homeland to specific destinations in America, helped migrants cope with the considerable risks entailed by their long journey. In addition, letters from those who had already migrated often gave glowing reports of the opportunities enjoyed by newcomers and raised the expectations of and excited potential migrants.

New technologies such as the railroad, telegraph, and steamship also added to the appeal of America by making

This cartoon places the blame for “anarchy, socialism, the Mafia, and such kindred evils” on the liberal immigration policy of the time, 1891. (New York Public Library)

communications and travel cheaper, safer, and quicker. Whereas it once took sailing ships from one to three months to travel across the Atlantic, by the 1880s new steam-powered ships were making the trip in one to two weeks. Major steamship lines such as Cunard, Holland-America, and White Star competed for passengers. Immigrants who chose to pay the cheapest fares were quartered deep in the bowels of the vessel in the filthy, crowded “steerage” section.

Most migrants from central, eastern, and southern Europe were very poor. One-third of the immigrants that came through Ellis Island could afford to go no further than New York City or its environs. Coming from rural backgrounds, most of the “new” immigrants were unskilled mechanically and did backbreaking labor on construction and railroads, as well as in coal mines, steel mills, and factories. Ironically, in the needle trades, where some skills were required, immigrants were exploited in sweat shops. The hardest, dirtiest, lowest paying jobs in industry were known as “foreign” jobs. For most immigrants, the work was harder, the hours longer, and the pay better than in their homeland, and in the last respect America kept its promise.

Although America utilized immigrant brawn, many of its native-born citizens did not welcome the immigrant presence. Immigrants are strangers in a strange land, but the new migrants from central, eastern, and southern Europe were even more strange in—and estranged—from America than the “old” migrants from northern and western Europe. Upon arriving in America, the newcomers’ inability to speak the language and unfamiliarity with American customs led many to seek people who spoke their language, shared their cultural values, and practiced their religion. Ethnic communities emerged in areas where large numbers of immigrants concentrated, and these communities helped immigrants make the transition from their homelands to America. They were places where the newcomers could learn about the traditions of their new homeland while retaining their own cultures.

In America’s cities, new immigrant communities took the form of densely populated ghettos. Overcrowded tenements, poor sanitation, and inadequate health services made many immigrant communities unhealthy places to live. The new immigrants, most of whom were not Protestant in religion, also confronted a brand of NATIVISM that viewed them as a threat to traditional American values and customs. American reformers attempted to remedy the situation in the immigrant communities and assist in the process of assimilation by operating various social and educational programs for the newcomers. The SETTLEMENT HOUSE movement, started in the United States by Jane Addams and Ellen Gates Starr, the cofounders of Hull-House in Chicago (1889), offered an important source of help for

immigrants. The success of Hull-House was followed by similar projects in most major American cities, especially New York, Boston, and Philadelphia. The settlement-house workers provided immigrants with medical services, emergency relief, citizenship courses, counseling or vocational training, assistance in getting a job, and lessons in cooking, hygiene, and English. These services were designed not only to improve the living conditions within immigrant communities, but also to provide the newcomers with the means and knowledge to assimilate into American culture and to become good citizens.

The urban immigrant communities also developed a mutually beneficial relationship with the local political “boss.” Many urban political machines, especially TAMMANY HALL in New York City, relied on the immigrant vote for electoral success, and immigrants felt they could turn to the boss when they needed help, which indeed they often did. In exchange for immigrant votes, the boss would provide jobs, emergency relief, legal assistance, or housing accommodations. Since the Democratic Party dominated much of the urban political landscape, many immigrants became loyal Democratic partisans.

### immigration restrictions

During the late 19th century, increasing IMMIGRATION to the United States from southern and eastern Europe—as well as smaller numbers from China and Japan—provoked the rise of NATIVISM and demands for restricting immigration. Nativist and anti-Catholic groups such as the Immigrant Restriction League and the AMERICAN PROTECTIVE ASSOCIATION (APA), labor union leaders, and several American intellectuals called on the federal government to rethink its open-door immigration policies and implement a program of more selective immigration.

The movement to restrict the number of immigrants entering the United States had first emerged in the 1870s. The roots of the restrictionist movement were grounded in the social and economic changes taking place in America

following the Civil War. These changes had produced a more stratified society where class tensions and labor conflicts abounded. Many Americans saw the new immigrants as the source of the nation's social and economic problems. Restrictionists argued that the newcomers promoted radical or un-American interests, were mentally and physically inferior, corrupted politics by selling their votes, were prone to crime and poverty, undermined the standard of living of American workers, and posed a threat to traditional American values.

Among the earliest proponents of restrictions on immigration were labor unions, with the bitterest opposition focused on the Chinese of California. The Workingmen's Party of California blamed unemployment and low wages on Chinese immigration. Supported by labor organizations in the East, western labor leaders lobbied CONGRESS to pass restrictive measures aimed at reducing the number of Chinese immigrants entering the United States. As a result, Congress passed the CHINESE EXCLUSION ACT in 1882, which prohibited the immigration of Chinese (except teachers, students, merchants, tourists, and officials) for 10 years. This law was renewed in 1892 and extended indefinitely in 1902. In addition, the influx of Japanese labor in the 1890s eventually led to a series of "gentlemen's agreements" with Japan beginning in 1900, with Japan agreeing to limit the emigration of unskilled workers bound for the United States. Unions opposed the importation of laborers from Europe as well as from Asia. Both the KNIGHTS OF LABOR and the AMERICAN FEDERATION OF LABOR (AFL) called for the end of recruiting contract laborers overseas. In 1885 Congress passed a CONTRACT LABOR law that prohibited the importing of workers under contract.

Religious bigotry was another source of restrictionist sentiment. Nativist groups in America, of which the APA was most prominent, were fearful of a "Catholic menace" and called for the restriction of emigrants from predominantly Catholic nations. Although the APA as an organization declined after 1896, anti-Catholicism continued to inspire opponents of immigration.

The third major restrictionist group was made up of American intellectuals based primarily in New England. Affected by a loss of status in the new social order emerging in late-19th-century America, they regarded themselves as the guardians of traditional American values. Their nationalist sentiments led them to credit American achievements to Anglo-Saxon superiority and traditions. They also accepted pseudoscientific SOCIAL DARWINISM, with its belief that the immigrants were mentally and physically inferior and therefore would corrupt America's superior Anglo-American stock; by barring new immigrants from entering the United States, traditional American values and Anglo-Saxon superiority would be preserved.

Apart from excluding Chinese (1882) and Japanese (1900) laborers, restriction made little headway in the 19th century. Restrictionists embraced literacy tests as the first step toward achieving their goal, and although Congress passed such a measure in 1896, President GROVER CLEVELAND vetoed it. As the 20th century began, more and more migrants sought freedom and opportunity in the United States, and the restrictionist movement continued to gain strength.

## imperialism

Imperialism in late 19th-century America involved both territorial and economic expansion, but not necessarily at the same time or in the same place. Imperialism was an international phenomenon, but the Americans, who had a whole continent to provide raw materials and domestic markets, had little compulsion to acquire more territory; in contrast, the Europeans and Japanese had an entirely different attitude toward imperialism. The United States, during the years 1870 to 1900, added 125,000 square miles, while Germany and Great Britain gained 1 million and 4.7 million square miles, respectively.

With the acquisition in 1898 of Spanish-held islands and HAWAII, the United States embraced overseas imperialism. Earlier efforts to acquire territory in the Caribbean and the Pacific had been frustrated in large part because of beliefs that territorial acquisitions should become states and that tropical islands with their nonwhite populations should not become states. Strategic, political, economic, and ideologic considerations undermined these ideas, opening the door for American imperialism.

Strategic concerns were straightforward. The surest way to thwart the imperialist ambitions of potentially threatening powerful, industrial nations was to acquire territory before they did. With a growing awareness of its need for an isthmian canal, the United States wanted to reduce the presence of European powers in the Caribbean, and it was obvious that Hawaii in the possession of a hostile power would threaten the safety of the West Coast. The United States also was plagued by social and political unrest in the 1890s. A severe economic depression with widespread unemployment, violent strikes, low farm income, and a divisive debate over the currency attracted politicians to an imperialist venture that

would divert attention from sectional and class tensions at home.

Unlike political and strategic concerns, the economic factors affecting American imperialism were more complex, less compelling, and did not necessarily require annexation of territory. European imperialists desired colonies for their raw materials, their markets, their investment opportunities, and their capacity to absorb surplus population. The United States, however, lacked few raw materials, sold most of its manufactured goods at home, had ample outlets for its capital in its own railroads and factories, and attracted thousands of immigrants from Europe. Economic factors did not compel the United States to dominate noncontiguous lands, but advocates of imperialism stressed that the nation needed markets for growing surpluses of agricultural crops, raw materials, and manufactured goods to avert disastrous downturns in the BUSINESS CYCLE like the one that began in 1893. Although exports accounted for less than 7 percent of the gross national product and Europe (the most economically advanced continent) bought more than three-fourths of American exports from 1870 to 1900, promoters of imperialism optimistically argued that trading agreements bringing less well-developed lands into the American economic orbit would be a substantial benefit.

The imperialists of 1898, however, openly advocated war and annexation. Guided by the ideology of Manifest Destiny, the United States had appropriated the land of Native Americans and of Mexico. Manifest Destiny, which imbued Americans with a sense of inevitable triumph and with its assumption of American superiority, was simply a rationale for imperialism. But by the 1890s it had acquired the pseudoscientific gloss of SOCIAL DARWINISM, which applied Charles Darwin's ideas of biological evolution (especially the survival of the fittest) to society. With nationalistic pride in American democratic institutions and in American enterprise mixed with notions of American cultural and racial superiority, American imperialists felt they were not only fit to survive, but among the fittest nations to dominate the world. In 1885 a Congregational missionary society published Reverend JOSIAH STRONG's *Our Country* in which, among other things, he predicted the ultimate triumph of English-speaking Protestant peoples throughout the world, with the United States taking the lead. Secretary of State JOHN HAY believed that peace and order in the world depended on its domination by Anglo-Saxons. Impatient for the inevitable triumph, American imperialists at the end of the 19th century advocated an aggressive FOREIGN POLICY lest their country be left behind in the scramble for colonies and spheres of influence. Ironically, many anti-imperialists agreed that the United States was a superior nation, but to keep it that way they opposed the incorporation of additional nonwhite peoples within its borders.

Imperialists succeeded in taking advantage of opportunities created by the SPANISH-AMERICAN WAR in 1898. Just as Congress ruled out the acquisition of CUBA in its war resolution that April, most Americans did not think of the war as one of conquest. But once the Philippines were occupied, President WILLIAM MCKINLEY felt compelled to keep them rather than allow them to fall prey to Germany, Russia, or Japan. Fears that a totally independent Cuba would tempt foreign powers also led McKinley to insist on the 1901 Platt Amendment, which made Cuba an American protectorate.

Possession of the Philippine Islands made the United States a Far Eastern power and gave it a base at Manila for enlarging its minuscule (2 percent) trade with China. (Many Americans also thought of it as a base for missionary activities.) But other industrial powers were already carving China up into spheres of influence and threatening it with dismemberment. To arrest these trends, Secretary of State John Hay in 1899 and 1900 circulated the OPEN DOOR NOTES among the great powers, advocating equal commercial opportunity for all within the various spheres of influence and upholding China's administrative and territorial integrity. A stalemate born of mutual fears rather than Hay's notes preserved China, but he enunciated an American policy that lasted 40 years and by renouncing territory (albeit for trade) gave it a moral flavor. Indeed, the lust for overseas territory was short-lived, but American imperialism—with its mix of uplift, mission, and trade—differed merely in emphasis from that of contemporary great-power nationalism. Generally, Americans preferred to hold the door open to their missionaries and products without formal annexation. Thus, informal empire was the lasting legacy of American imperialism.

### Indian Affairs, Office of (Indian Bureau)

The Office of Indian Affairs dates back to 1824, when it was established by Secretary of War John C. Calhoun to oversee white-Indian relations and administer programs to “civilize” NATIVE AMERICANS. The office was formally endorsed by CONGRESS in 1832 and received full authorization in 1834, empowering the president to appoint a commissioner of Indian Affairs. Initially the office was lodged in the War Department, but in 1849 the Office of Indian Affairs was transferred to the newly created Depart-

A cartoon criticizing the corruption of the Office of Indian Affairs (Library of Congress)

ment of the Interior and was primarily engaged in moving Native Americans to the West in order to open their lands for white settlers. The military presence in the Office of Indian Affairs continued until 1870, when Congress prohibited the appointment of military personnel to positions on the reservations that the government had begun to establish following the Civil War.

In 1871 Congress decided that Indian tribes would no longer be regarded as independent nations with whom treaties were made, in effect decreeing that Indian affairs would be conducted by the federal government without the consent of Native American nations, tribes, or bands. With occasional broad guidelines from Congress, the president, and the secretary of the interior, the Office of Indian Affairs implemented Indian policy.

By the 1870s the Office of Indian Affairs was renowned for its corruption. Its crucial work was performed by

approximately 70 Indian agents appointed by the president for four-year terms. These agents administered Indian reservations, some as large as Connecticut, and often cheated both the government and the Native Americans under their jurisdiction. Since removing Indians to reservations usually deprived them of their livelihood, the distribution of annual subsidies from the federal government (\$5.9 million in 1880, for example) provided ample opportunities for graft. Agents, aided by approximately 750 employees—about 11 per reservation—were expected to keep the peace and to help the Native Americans become law-abiding, economically productive people. A typical agency might hire from outside the reservation a farmer, a blacksmith, a carpenter, a teacher (who occasionally was a woman), and a miller and from the tribe itself an interpreter, a herder, a teamster, and a laborer. Apart from schools on reservations, the Office of Indian Affairs also established off-site board-

ing schools (the most famous was at Carlisle, Pennsylvania) that worked to assimilate young Native Americans by separating them from their homes and culture.

Aimed at assimilating Indians into the larger Euro-American society, the Office of Indian Affairs' programs worked to destroy the Indian way of life. On reservations, hunting had to be abandoned and agriculture adopted, but it proved inadequate and necessitated food rations, which kept the tribes dependent on the government. The agency also administered the distribution of land following the DAWES SEVERALTY ACT of 1887, which conferred land ownership to individual members of tribes, thus breaking a long tradition of collective ownership within each tribe. The Office of Indian Affairs remained a paternalistic force in Indian culture until the 1930s, when the agency became more concerned with protecting Native American culture and heritage and promoting self-determination among the tribes.

### Indian Rights Association

Founded in 1882, the Indian Rights Association was the first major advocacy organization for NATIVE AMERICANS. As a lobbying power and shaper of public opinion, the Indian Rights Association raised consciousness about the plight of Native Americans as it worked to enact reforms and ameliorate conditions for Indians.

The Indian Rights Association was founded in large part by Herbert Welsh, an upper-middle-class Philadelphian. Welsh and his colleague Henry S. Pancoast traveled with an Episcopal mission to the Dakota Territory in the spring of 1882 and spent four weeks visiting Sioux agencies. Welsh returned and published his proposals for reform in a pamphlet called *Four Weeks among Some of the Sioux Tribes*. By the end of the year, he and Pancoast had established the Indian Rights Association to secure political and civil rights for Native Americans and to act as a watchdog group to ensure that their treaties with the U.S. government were enforced.

Association members were affluent, and Welsh tapped Philadelphia high society for support. Welsh spent the next year meeting with influential patrons in the East, doing speaking engagements and raising funds. By 1885 the Association had a home office in Philadelphia and a lobbyist in Washington, D.C. Welsh and the Indian Rights Association

worked on behalf of the Sioux tribes, in particular, in the organization's first years and lobbied for the DAWES SEVERALTY ACT of 1887, which distributed tribal lands to individual Indians, a measure designed to acculturate and "civilize" Indians. As the latter goal suggests, the Indian Rights Association was paternalistic in its approach, and Welsh initially looked to assimilate the tribes and replace their customs with Christianity, a system of laws and education, and a Protestant work ethic. Welsh worked to increase educational opportunities for Native Americans, which tended to break the fabric of Indian culture rather than encourage it. Ultimately, Welsh trusted the concept of federal oversight of tribes, and the Indian Rights Association worked within the federal Office of INDIAN AFFAIRS (Indian Bureau) to guarantee fair dealings between the government and the tribes.

True to its name, the Indian Rights Association promoted Indian rights in the Sioux land dispute during the 1880s, the APACHE WAR in the late 1880s, the GHOST DANCE WAR in 1890, and the attempted removal of the Ute Indians from Colorado in the 1890s. Welsh relinquished direct control of the organization in 1904, which, despite its paternalism and its efforts to acculturate Indian Society, had ameliorated the treatment of Native Americans.

### industrial revolution, second

While the first American industrial revolution occurred primarily in the manufacture of textiles, the second, or new, industrial revolution occurred in steel, petroleum, and electrical industries. The revolution in textiles began in the late 18th century and made Great Britain the manufacturing center of the world; the second revolution began roughly about 1870 and resulted in American primacy among industrial powers. Indeed, during the Gilded Age the United States experienced the greatest surge of increased productivity the world has ever witnessed. American success resulted in part from American advantages. The United States was a huge country with abundant raw materials. It possessed the most extensive RAILROAD network in the world, one that moved raw materials and finished products at high speeds and low costs, allowing a quick return on invested capital. Its relatively prosperous population, growing from natural increase and immigration, provided both an adequate labor supply and an

expanding home market. Capital was in short supply, but Europeans—especially the British—invested heavily in the United States. Finally, the American government was stable and encouraged industry with a protective tariff (see **TARIFF ISSUE**).

No matter what index of production is used, industry's rate of growth in the Gilded Age was prodigious. Robert E. Gallman has calculated that the value added by manufacturing multiplied almost six times from 1869, when it was \$1,078 million, to \$6,252 million in 1899, while Edwin Frickey's index of manufacturing production multiplied four times from 1870 to 1900. Rapid growth also resulted from American ingenuity. Manufacturers were quick to adopt technological innovations because labor was expensive and labor-saving devices cut costs significantly. Some of the largest companies established laboratories and employed scientists, especially chemists, to improve processes. Americans were inventive, but the concepts of interchangeable parts and the division of labor were basic to American productivity. In addition, manufacturers began to embrace the "scientific management" advocated by Frederick W. Taylor, who made time and motion studies of workers and instituted piecework to induce them to move faster and more efficiently. Perhaps the entrepreneurs themselves were the most important factor in the surge of American production; both John D. Rockefeller and **ANDREW CARNEGIE**, for example, were talented organizers and administrators, picked able associates, and worked hard. Rockefeller's attention to detail down to the minuscule cost of barrel bungs and Carnegie's obsession with efficiency were legendary.

Virtually all industries experienced rapid growth in the Gilded Age, but the most spectacular developments were in **STEEL**, **OIL**, and electricity. With the introduction of the **BESSEMER PROCESS**, the steel industry took off and with it the **MINING** of the iron ore and bituminous coal necessary for its production. Steel (an alloy of iron and carbon that is strong and malleable) had been produced in small quantities for swords and armor for centuries and, since the 18th century, in slightly larger amounts in crucibles. The Bessemer converter, which made steel quickly and in large batches, was invented in Great Britain in the 1850s, but large-scale production of American steel began in the 1870s. In 1870 only 68,750 long tons were produced; by 1880 1.2 million; by 1890 4.3 million; by 1900 10.2 million; and in 1913, on the eve of World War I, 31.3 million long tons of American steel were manufactured. By then the United States produced more steel than Germany, Britain, and France combined.

The production of nonferrous metals, although only a fraction of steel output, was significant and grew rapidly in the Gilded Age. Copper production in 1870 was 14,112 tons, doubled to 30,240 tons in 1880. It took off to 129,882

tons in 1890 and 303,059 tons in 1900. Lead production rose steadily from 17,830 tons in 1870 to 367,773 tons in 1900, while zinc went from 5,400 tons in 1870 to 123,886 tons in 1900. Aluminum production, beginning with minuscule amounts in 1886, reached 23,000 long tons in 1900, but its importance would grow in the 20th century.

Unlike railroading, coal mining, and steelmaking, the petroleum industry began in America. Edwin L. Drake drilled the first successful oil well in 1859 near Titusville, Pennsylvania. Drake invented, but failed to patent, the drive pipe that essentially is still used in drilling wells and made little money from his discovery. The impact of his discovery was instantaneous, since petroleum could be refined (distilled) inexpensively into superior lubricants and kerosene, which provided excellent lamplight. In 1861, two years after Drake's discovery, more than 2 million barrels of crude oil were produced, and by 1870 production had increased to 5.3 million barrels and continued to grow to 63.6 million barrels in 1900.

Although virtually all factories were powered by steam engines in the Gilded Age, electricity was of great importance. Instantaneous **COMMUNICATION**—by the telegraph and the telephone—over great distances were made possible by electrical devices. Illumination by the electric lightbulb invented by **THOMAS A. EDISON** in 1879 was superior to that given off by a kerosene lamp and demand for it led to the development of a central power station on Pearl Street in New York in 1882 and to the rise of electric utilities. By 1889 electric power stations were producing 260,000 horsepower, which by 1900 increased to 2.4 million horsepower. The early Edison power stations generated direct current, which could be transmitted only short distances, but George Westinghouse (who in 1869 invented the railroad air brake) utilized a transformer in 1885 to raise the voltage of an alternating current (AC) and succeeded in transmitting it a significant distance. Although AC could light bulbs, there was no AC motor. **NIKOLA TESLA**, an independent electrical inventor who associated briefly with both Edison and Westinghouse, developed AC generators, transformers, and—most important—motors. Tesla sold his patents to Westinghouse in 1888. Thanks to Tesla's inventions and despite Edison's opposition, AC triumphed, especially after Westinghouse put on a spectacular exhibit at the 1893 **WORLD'S COLUMBIAN EXPOSITION** at Chicago. Tesla's motors installed on trolley cars and **ELEVATED RAILROADS** (els) revolutionized urban transport and enabled cities to add an outer ring heretofore unreachable by horsecar. Tesla's work also had a great impact on industry. The electric motor, powering individual machines, provided flexibility and was particularly advantageous for the small factory. Although only 2 percent of factories in 1900 were powered by electric motors, they were clearly the wave of the future.

The spectacular economic development of the late 19th century was largely accomplished by corporations. The corporation, consisting of many shareholders, had great advantages over individual ownership or partnerships: The liability of investors in a corporation is limited to the shares owned, shares can easily be sold, the corporation has a life of its own, and large amounts of capital can be raised by a corporation through the sale of stocks and bonds. To function—to acquire a life of its own—a corporation required a charter that, in the early years of the republic, required a special act of incorporation, but by the 1870s usually were acquired through general incorporation laws.

Gilded Age corporations, to eliminate competition (which their managers abhorred while praising it in public), combined with one another to form what became known as TRUSTS. Initially pools, or informal agreements, were used to eliminate competition. Railroads used pools to set rates, divide freight, and apportion receipts until the Interstate Commerce Act made them illegal. The chaotic oil industry and competition by railroads for its freight led to the notorious but short-lived South Improvement Company pool. The carriers divided freight on a percentage basis, and refiners—among which Rockefeller's Standard Oil Company was the most prominent—apportioned their shipments, on which they received a rebate, among the railroads. Pools functioned best in flush times but easily collapsed when business fell off and cheating increased. In addition to their generally short duration, pools could not be enforced.

Although Rockefeller and other refiners organized a subsequent pool, an association, that allotted crude oil to its members, he and his associates (who refined 90 percent of the nation's oil) were unhappy with pooling arrangements. His lawyer, S. C. T. Dodd, suggested that a trust agreement among the associates would provide order and authority. Accordingly, 41 stockholders of Standard Oil of Ohio signed a trust agreement that gave them trust certificates for their property, which they turned over to a board of nine trustees. The trust was so obviously monopolistic that the Ohio courts dissolved it in 1892.

The Standard Oil trustees had already incorporated the Standard Oil Company of New Jersey. That state's incorporation laws did not prevent the creation of a holding company, which in effect was the corporation that combined the individual corporations. In 1899 Standard Oil of New Jersey became a true holding company by increasing its stock from \$10 million to \$110 million and exchanging that stock for the stock of 40 companies in the Standard group.

Consolidation also characterized the iron and steel industry. Almost 1,000 iron companies were combined in the late 19th century into a few large companies, of which Carnegie Steel was the largest. Since the early 1870s with

the opening of his J. Edgar Thompson Steel Works, Carnegie had dominated the steel industry. He assembled a vertical combination controlling iron ore and coal mines, transport facilities, steel mills, and fabrication plants. Carnegie Steel, however, was a limited partnership, not a corporation, for much of its existence. Yet disputes with partners, especially HENRY CLAY FRICK, and Carnegie's desire to retire required that he convert his partnership into a corporation, which he did in 1900. Unlike the oil business where virtually no competition existed, there were other formidable steel combinations, especially Elbert H. Gary's Federal Steel, a holding company established in 1898 with which Carnegie was willing to compete. Gary did not wish to compete and with the blessing of J. P. MORGAN asked Carnegie to name his price. The \$480 million asked was immediately accepted, and in 1901 U.S. Steel became a billion-dollar holding company controlling 60 percent of the industry, with Carnegie Steel as its largest component.

Consolidations occurred in electrical industries. Western Union had long dominated the telegraph business. American Telephone & Telegraph (AT&T) was established in 1885 by American Bell to institute long-distance service, and in 1907, following its reorganization by J. P. Morgan, AT&T began aggressively acquiring independent telephone companies in its quest for one nationwide system. Morgan also supported HENRY VILLARD's consolidation in 1892 of Edison and other electrical companies into the General Electric Company. Four years later Westinghouse and General Electric, the only major manufacturers of electrical equipment, agreed to pool their patents covering light bulbs, motors, dynamos, and street railway equipment. Despite the pooling of information, the two electrical giants remained surprisingly competitive. Nevertheless, the overall trend of mergers and consolidations was the elimination of competition, the adjustment of supply to match demand, and a certain rigidity in price that repealed the law of supply and demand.

**Further reading:** Alfred D. Chandler, Jr., *The Visible Hand: The Managerial Revolution in American Business* (Cambridge, Mass.: Harvard University Press, 1977); Samuel Haber, *Efficiency and Uplift: Scientific Management in the Progressive Era, 1890–1920* (Chicago: University of Chicago Press, 1964); Edward C. Kirkland, *Industry Comes of Age: Business, Labor, and Public Policy, 1860–1897* (New York: Holt, Rinehart and Winston, 1961).

**Ingersoll, Robert Green** (1833–1899) *lawyer, orator*  
Robert G. Ingersoll was born in Dresden, New York, on August 11, 1833. His father, a Presbyterian minister too steeped in Calvinism for the taste of his congregations, frequently moved in a westerly direction, limiting Ingersoll's

formal schooling. But he read widely and was well versed in the classics. For two years Ingersoll taught school in Illinois and in Tennessee and then, with his brother Ebon Clark Ingersoll, studied law with a Democratic congressman in Marion, Illinois. In 1854 the brothers were both admitted to the bar. Together, they practiced in Shawneetown, in southern Illinois, and in 1857 moved north to Peoria, where they prospered.

Although he was antislavery, Ingersoll in 1860 ran unsuccessfully for Congress as a Stephen A. Douglas Democrat. With the onset of the Civil War in 1861, Ingersoll helped raise the 11th Illinois Cavalry regiment and was appointed its colonel. Before leaving for war he married Eva Amelia Parker on February 13, 1862. They would have two daughters. Less than two months after his marriage Ingersoll participated in the Battle of Shiloh (April 6–7), and on December 18 he and part of his command were captured at Lexington, Tennessee. Although he was paroled in March 1863, Ingersoll's hope of being exchanged was not realized, so he resigned his commission on June 30, 1863, and resumed the practice of law in Peoria. Possessing a superb courtroom manner, he excelled as a defense attorney and numbered RAILROADS among his clients.

Never a firm Democrat, Ingersoll emerged from the war a Radical Republican. An effective campaign speaker and a good lawyer, Ingersoll served as attorney general of Illinois from 1867 to 1869. He sought the Republican gubernatorial nomination in 1868 but was defeated by the popular and powerful general John M. Palmer. Remaining a tireless campaigner for the Republican Party from the 1860s to the 1890s, Ingersoll never again held public office. In an era of gifted political speakers, he was arguably the greatest. On the campaign trail he would alter his set speeches to suit his immediate audience sufficiently to be quoted by newspapers.

In 1876 his speech at the Republican National Convention nominating for president JAMES GILLESPIE BLAINE, whom he likened to “a plumed knight,” moved the delegates to a near frenzy. Ingersoll was a genius at arousing the emotions of a crowd. The correspondent of the *Chicago Tribune* marveled at his “wizard power. . . . He swayed and moved and impelled and restrained and worked in all ways with the mass before him as if he possessed some key to the innermost mechanism that moves the human heart.” Blaine would have been nominated by acclamation the moment Ingersoll finished had his opponents not secured an adjournment until the next day, when they agreed on RUTHERFORD B. HAYES and defeated Blaine.

Although disappointed, Ingersoll campaigned for Hayes. Adept at “waving the bloody shirt” (keeping alive the passions of the Civil War and Reconstruction), Ingersoll delivered a classic of that genre before Union veter-

ans. Beginning with “Every State that seceded from the United States was a Democratic State,” he cataloged the sins of Democrats. After stating “Every man that shot Union soldiers was a Democrat” and “The man who shot Abraham Lincoln was a Democrat,” he climaxed with “Soldiers, every scar you have on your heroic bodies was given you by a Democrat.” Hayes won the disputed election of 1876 in part because the GRAND ARMY OF THE REPUBLIC remained loyal to the Grand Old Republican Party. Hayes was grateful and planned to appoint Ingersoll minister to Germany but gave up when religious groups protested.

Ingersoll was an agnostic, believing the existence of God is unknowable, and made no secret of his religious views. He was such a good political speaker that no candidate would turn down his support, and audiences, whether God-fearing or not, loved to hear him lecture on politics, literature, and religion. His political speeches, especially the nomination of Blaine, made him famous and attractive on the lyceum circuit and enabled him to present his religious views to a wide audience. Reversing Alexander Pope's statement, Ingersoll believed that “An honest God is the noblest work of man,” but that most gods man has created are “vengeful, savage, lustful, and ignorant,” including the Judeo-Christian God. Ingersoll dismissed the Bible as a collection of “ignorant legends of the barbaric past,” a source of persecution that “burned heretics, built dungeons, founded the Inquisition, and trampled upon the liberties of men.” He regarded the dogmas of all Christian denominations about salvation and damnation as vicious and illogical and contrary to the love and mercy Jesus advocated. Ingersoll enjoyed playing the role of heretic and infidel, and his auditors enjoyed the show. Reverend HENRY WARD BEECHER, whose notions of an evolving God were not far from Ingersoll's ideas, called him the greatest speaker in the English language and became a personal friend. Ingersoll did believe “in the gospel of liberty . . . the gospel of Intelligence . . . in this great gospel of Humanity.”

When not on the lecture circuit or on the political stump, Ingersoll defended some high-profile people. In 1876 he won the acquittal of Daniel W. Munn, a member of the notorious Whiskey Ring. The next year, as befitting one with a national reputation, Ingersoll moved to Lafayette Square (opposite the White House). His most famous case involved Republican officeholders involved in the STAR ROUTE FRAUDS. In two trials (1882–83) he succeeded in getting the chief defendants acquitted. With his dramatic summations Ingersoll was clearly the star of these proceedings. In 1885 he moved to New York, and there in 1887 secured a judgment for a client against JAY GOULD's Western Union Telegraph Company for \$1.5 million. More than a great lawyer, Ingersoll was a great pleader. He died on July 21, 1899, in Dobbs Ferry, New York.

### Internal Revenue taxes

The first income tax in the United States was levied to help finance the Civil War. In August 1861 Congress approved a tax of 3 percent on incomes above \$800; by 1864 it had graduated to 10 percent on incomes in excess of \$10,000. In addition, excise taxes on virtually every raw and manufactured material were levied by Congress in July 1862. By 1865 these internal revenue taxes provided the bulk of federal tax receipts. Congress removed most of the excise taxes from 1866 to 1870 (distilled liquors was one of the exceptions) and the income tax in 1872. During the Ulysses S. Grant administration, the "whiskey ring" of Internal Revenue officers and distillers defrauded the federal government of excise tax revenues.

In the late 19th century the income tax received wide support. Such tax legislation would improve the government's revenue base while securing more tax dollars from corporations and the wealthier individuals. The idea of a graduated or progressive income tax that would require people with higher incomes to pay a higher percentage than those with less income was supported by several agrarian and labor organizations. The GREENBACK-LABOR PARTY, the PEOPLE'S PARTY (Populists), the KNIGHTS OF LABOR, and several members of the DEMOCRATIC PARTY endorsed the graduated income tax. By the 1890s the movement for a federal graduated income tax was taken up by the Progressive reformers.

Efforts to enact federal income tax legislation encountered a major constitutional obstacle over the question of whether the federal government could levy direct taxes on individuals instead of apportioning them out to the states according to their respective populations. In 1894 Congress included in the Wilson-Gorman Tariff a 2 percent tax on all incomes above \$4,000. It was the first direct tax on Americans during peacetime. The constitutionality of the income tax was immediately challenged in the U.S. SUPREME COURT, and in the case of *Pollock v. Farmers' Loan and Trust* (1895) the income tax was ruled unconstitutional. The Court held that it constituted a direct tax and hence was subject to the constitutional requirement of apportionment among the states according to population.

Despite the Supreme Court's ruling in the *Pollock* case, the demand for a federal income tax did not go away. As the Progressive movement gained momentum in the early 20th century, so did the push for a federal income tax. Progressive reformers argued that an income tax was the best and fairest means of raising revenue for the federal

government. In 1913 the Sixteenth Amendment was ratified, permitting a federal income tax.

### inventions and technology

Between 1870 and 1900, the United States experienced an explosion in innovation. Independent American inventors such as THOMAS EDISON and ALEXANDER GRAHAM BELL and Serbian-born NIKOLA TESLA dominated technological advancement, in some cases building large empires around their innovations. Edison was perhaps the best-known inventor of this time period; his expansive laboratory in West Orange, New Jersey, established in 1887, employed dozens of men who worked to produce more than 1,000 patents for new inventions. Electrical inventions—the greatest innovations of the era—and a host of smaller inventions laid the foundation for the economic boom that improved the quality of life for Americans in the 20th century.

Theories on electricity were first developed in Europe in the early 1800s, and early electric engines, called "dynamoes," evolved there in the 1870s. Meanwhile, the development of electric lighting in the United States sparked the wider use of electric power in all aspects of technology. Charles F. Brush was one of the first Americans to adapt arc lighting, an early 19th-century technology utilizing an electric arc between carbon rods, for use in homes and businesses. During the 1870s Brush developed a cheaper arc-lighting system, which began to supplant gas-powered lamps, especially when used for outdoor lighting. Brush experimented with high-voltage dynamos and central stations that transmitted electricity in a large-scale system (rather than using them for small independent circuits). The first central electric station to power arc lighting appeared in San Francisco in 1879. By the following year similar operations were established in New York, Philadelphia, and Boston. In subsequent years Elihu Thomson (1853–1937) founded the Thomson-Houston Electric Company and became a leader in the arc-lighting industry, developing better dynamos and other techniques that increased efficiency.

In 1878 Thomas Edison began to develop incandescent lighting, refining the technology of the lightbulb and

cutting down on expensive copper wiring to make the technology less expensive. On New Year's Eve 1879 Edison demonstrated 150 bulbs that used carbonized cotton thread in Menlo Park, New Jersey. Edison's first test of electricity for wider uses came in 1882 in New York City, when he laid underground wiring as part of a direct current (DC) system in a small section of New York's financial district, thus establishing a prototype of the modern power grid. In 1885 the electric transformer was invented to facilitate the transmission of electricity. Edison established one of the first power companies, the Edison Electric Illuminating Company, to provide consumers with the power to run electric lights. By 1888 Edison had established electric companies in eight major cities, and he had founded other subsidiaries that built conductors, generators, and lamps while continuing to dominate the market for incandescent lighting. However, in 1886 George Westinghouse

(1846–1914) developed an alternating current (AC) lighting method that became a viable challenger to Edison's DC empire. Alternating-current technology, capable of higher voltage, had an advantage over direct current in carrying electricity over long distances efficiently.

Electricity proved useful in other applications, including public transportation. Pollution-causing horse-drawn trolleys were common until the mid-1880s, when steam and electric-powered trains began to be used. Again, Thomas Edison was at the forefront of early efforts to use electrical power with streetcars. These early attempts, however, were unsuccessful and dangerous, and his low-power DC motors were ill-equipped to handle large streetcars. During the mid-1880s Frank J. Sprague, who worked with Edison's company, began to develop better DC motors, which were used in electric cars. In 1887 the municipality of Richmond, Virginia, awarded Sprague the contract to

An interior section of the Electricity Building at the World's Columbian Exposition of 1893. The Westinghouse electrical systems and Tesla motor were on display. (Smithsonian Institution)

build the first electric train line; by 1903 nearly all street-car lines in the United States were electrified. The Pullman Car Company constructed an electric freight-hauling locomotive in 1888, although steam-powered trains continued to dominate long-distance train traffic well into the 20th century.

Because of its high energy use, direct current was less economical than steam power. Realizing that alternating current used less electricity than direct current and was therefore cheaper, George Westinghouse began experimenting with AC for use in motors. Westinghouse then tapped Nikola Tesla, who had discovered the rotating electromagnetic field in 1882, to create an AC motor using his discovery. Tesla invented an AC motor in 1888, and Westinghouse immediately bought the patents. Tesla continued to advance electricity technology, inventing the Tesla coil in 1891, which supplied a high-frequency, high-voltage current that would later reach wide use in radios and televisions. Meanwhile, Edison had recognized the limitations of DC and wanted to begin working with AC. Patent laws forced Edison to merge in 1892 with Thomson-Houston, the Westinghouse rival that also had patents on AC technology. The merger created General Electric, which survives to this day. General Electric developed its own AC motor technology in 1894 and eventually pooled patents with Westinghouse for a period of time in order to refine electric technology. The market for electricity expanded in the 1890s after Westinghouse built the first hydroelectric turbogenerator at Niagara Falls in 1896, which harnessed nature to generate power on a large scale.

The development of the telephone and its wide-scale use began with Alexander Graham Bell's submission of an application for telephone technology in 1876. Western Union, the telegraph company, began to utilize telephone technology in 1877, leading the Bell Telephone Company to file a patent-infringement lawsuit. In the end, however, Western Union's patent infringement had the positive effect for Bell of greatly expanding phone use in the country. Western Union ended up selling its 56,000 phones to Bell in 1879 after settling their dispute; only a few hundred phones had been in use in 1877, and Western Union's wide use of phone technology ultimately helped precipitate the decline of telegraph technology. Bell began to use central exchange systems to expand telephone use, eliminating the need for an abundance of unsightly wires. By the early 1880s Bell Telephone began to implement a system of underground wires, eventually developing telephone connections between Boston and New York in 1884 and expanding them to Washington, D.C., and Chicago in 1893, thus solidifying its monopoly on long-distance telephone service for years to come.

American life was transformed by new building materials such as concrete, iron, and steel during this time

period. SKYSCRAPERS built of iron and steel consolidated increasingly large business operations in central locations and contributed to the density of urban centers like New York and Chicago. The first skyscrapers were built following the CHICAGO FIRE of 1871, which devastated the central part of the city. The first tall structure was the 10-story Montauk Building in Chicago, made from cast-iron. The first true skyscraper, using a steel frame, was Chicago's 10-story Home Insurance Building, which was constructed in 1883. The invention of the electric elevator in 1889, using technology pioneered by Elisha Otis (1811–61), and the escalator in 1891 hastened the era of the skyscraper.

Industry benefited greatly from technology developed during this period. Arc lighting and eventually incandescent bulbs lit even the deepest mine shafts, made possible by the new application of dynamite and nitroglycerine. Miners used steam-powered air drills instead of picks and shovels to pull ore out of the ground, and the refining process itself became more efficient through the use of new machines. The logging industry also was helped by steam power and machines, and both industries greatly increased production as a result of new technology. RAILROADS, which played a key role in the expansion of both the logging and MINING industries, were improved through the systemization of rail gauges across the country, more powerful locomotive engines, the invention of the air brake (by Westinghouse), and the use of steel in rails and bridges.

Other smaller inventions made life and commerce easier. These included the electric dental drill (1875), Louis Waterman's fountain pen (1884), the ballpoint pen (1888), William Burroughs's adding machine (1888), and King Gillette's safety razor (1895). The first punch-card "computer" technology was developed in 1888 and used in the 1890 U.S. census.

Many of the inventions and patents from this period were more fully developed in the 20th century. The patent on the gasoline-powered car was obtained by George Selden (1846–1922) in 1895, and Henry Ford (1863–1947) constructed his first car in 1896. Edison developed primitive motion-picture technology during this period, and celluloid photographic film—invented in 1887—expanded both still- and motion-picture technology. The first publicly screened motion picture was shown in New York City in 1896. GEORGE EASTMAN (1854–1932) advanced photographic technology with several major inventions during the 1880s and 1890s, including the Eastman Kodak box camera, which used roll film and opened up the world of photography to amateurs. Edison's early phonograph, which used tinfoil cylinders to record sounds, was more fully realized in later years by the recording industry. Together with motion-picture technology, Edison's inventions helped transform American popular ENTERTAINMENT. Orville and Wilbur Wright's work on the airplane, which would

revolutionize transportation and warfare, capped a burst of innovation on par with one of civilization's greatest eras of achievement.

### investments, American, abroad

American investments abroad were negligible before the Civil War. As a debtor nation (more foreign capital was invested in the United States than U.S. capital was invested abroad), the United States was chronically short of capital. Americans invested in domestic enterprises that utilized the country's abundant natural resources and had little interest in doing business elsewhere.

In the late 19th and early 20th centuries, American manufacturers, insurance companies, utility operators, and mining companies found it advantageous to develop a foreign presence. Most of these enterprises, like the Singer Manufacturing Company, which opened a sewing machine plant in Scotland in 1882, were launched to distribute their products to foreign markets. A variety of factors converged to encourage American businesses to establish operations in foreign countries: high tariffs in Canada after 1879 and Japan in 1899; restrictions on the use of electrical patents in France and Germany; and deposit requirements for insurance businesses in Germany, Austria, and Switzerland. Nevertheless, in these enterprises American firms were able to attract foreign capital, managers, and even technology.

American businessmen preferred investing funds in neighboring North American countries. In Mexico, the country with the largest American investments before the Mexican Revolution began in 1910, the dictatorship of Porfirio Díaz created a climate favorable to foreign investment. Canada was second in favor as a location for American investment. In CUBA and elsewhere in the Caribbean, American investments increased after the SPANISH-AMERICAN WAR. After the depression from 1893 to 1897, American businesses eagerly sought opportunities to develop markets by operating abroad, and the United

States became a net exporter of capital during the period from 1898 to 1901.

### investments, foreign, in the United States

Although the American economy had matured considerably by 1870, development was still largely dependent on infusions of foreign capital. Prior to the Civil War the British had already invested in bonds to finance the construction of turnpikes, canals, and railroads, but the railroad boom in the late 19th century created an almost insatiable demand for capital from abroad. American bankers such as George Peabody amassed a fortune by selling American securities while living in England. Declining interest rates from 6 percent to 4 percent made American entrepreneurs even more anxious to sell their bonds abroad. Foreign investments in the United States, which totaled \$1.5 billion in 1869, grew to \$3.4 billion in 1897 and \$6.4 billion in 1908.

The large value of American exports, especially of agricultural products, over that of imports was sufficient to meet growing interest payments and keep trade in balance. But by the mid-1890s American business leaders became concerned that the large infusions of foreign capital would require greater exports, especially in manufactured goods, to prevent the outflow of gold to pay foreign investors. Thus, the search for overseas markets became a factor in popular opinion on foreign policy issues. World War I, however, abruptly changed the patterns of international investment. European capital invested abroad shrank and the United States—with its enormous productivity and high rate of savings—suddenly was transformed from a debtor to a creditor nation.

**Jackson, Helen Hunt** (1830–1885) *writer, Indian rights advocate*

The author Helen Hunt Jackson became the most eloquent champion of Native Americans in the Gilded Age. Born Helen Maria Fiske on October 15, 1830, in Amherst, Massachusetts, she was a close lifelong friend of EMILY DICKINSON, but for years she gave little indication of her own literary talent. She did have an independent spirit that rejected the puritanism of her parents, was reasonably well educated for a woman of her day, and was witty and vivacious. Attending a ball given by Governor Washington Hunt of New York, she attracted the attention of his brother, Lieutenant Edward Bissell Hunt, an army engineer, and they married in 1852. Over the next 11 years they led a nomadic life, but she met the editor THOMAS WENTWORTH HIGGINSON in Newport, Rhode Island, and made valuable contacts in Washington. In 1863, however, her husband accidentally died in New York harbor while trying to develop a torpedolike device, and in 1865 her only surviving child died of diphtheria. Hunt worked her way out of her despair by writing poetry, which began to appear in the *NATION* and the *New York Evening Post*, and turned to Higginson to help her hone her writing skills. By the 1870s she was a successful writer not only of poetry but also of travel books, reviews, and anonymous novels, including a roman à clef about Dickinson, whose talent she recognized and whom she urged to publish. In 1873 Hunt sought relief from a sore throat in the Rockies, where she met William Sharpless Jackson, a wealthy railroad promoter. They married in 1875 and settled in Colorado Springs, but she regularly visited California (which she loved) and the East Coast to maintain her publishing contacts.

Ironically, it was not in Colorado or California but in Boston where she became aroused by the plight of the NATIVE AMERICANS. There in 1879 she heard the Ponca chief Standing Bear and BRIGHT EYES, a young Omaha woman (the Omaha were closely related to the Ponca), protest the removal of the Ponca from their reservation

to the Indian Territory (present day Oklahoma). Although Jackson previously had shown little interest in reform, she became an ardent advocate of Indian rights and in 1881 published *A Century of Dishonor*, which condemned the federal government for its treatment of the Indians.

The Interior Department, rather than ignoring Jackson, asked her along with Abbot Kinney to investigate the condition of the Mission Indians of California. When their report, which appeared in 1883, had no obvious effect on CONGRESS, Jackson resolved to write a novel that she hoped would affect Indian rights the same way her friend Harriet Beecher Stowe's *Uncle Tom's Cabin* had affected the abolitionist movement. *Ramona*, published in 1884, was an immediate success and has gone through more than 300 printings. *Ramona*, a half-breed young woman raised by an old Spanish California family, falls in love with an Indian forced off his land by whites. Jackson was disappointed that although her book was enormously popular and her readers enjoyed her romantic tale, they did not seem to get the underlying message of the ill treatment of Native Americans. A year later, on August 12, 1885, Jackson died of cancer in San Francisco.

**James, Henry** (1843–1916) *writer, critic*

The son of Henry James, the heir of a prosperous entrepreneur, and Mary Robertson Walsh, novelist Henry James was born on April 15, 1843, in New York City. Brought up in an intensely intellectual household—his father wrote several books on religious philosophy and his older brother WILLIAM JAMES was to become an influential philosopher and psychologist—James was tutored at home, where family friends included Nathaniel Hawthorne and Ralph Waldo

Emerson. Between 1855 and 1860 his parents broadened his cultural horizons by bringing him to England, Switzerland, France, and Germany, where he continued to study with private tutors, and at the age of 19 he followed his brother to Harvard. After a semester in law school, he returned to New York and devoted himself to writing, publishing both fiction and literary criticism by the age of 21.

Still hungry for a deeper cultural perspective than he felt the materialistic American intellectual climate provided, James returned to Europe in 1869 and settled at last in London in 1872. Except for brief visits to the United States, he remained there until his death on February 28, 1916, becoming a British subject in 1915. The most famous American literary expatriate of his time, he befriended the leading authors of Europe, including French and Russian realists Gustave Flaubert, Émile Zola, and Ivan Turgenev and such British intellectuals as Herbert Spencer and Thomas Henry Huxley.

In 1875 he published his first collection of stories, *The Passionate Pilgrim*, foreshadowing his recurring themes of nostalgia for an older culture and the confrontation between the innocent American and the sophisticated European. His novel *Roderick Hudson*, serialized that year in the *Atlantic Monthly* (then edited by his close friend WILLIAM DEAN HOWELLS), recounted the story of an American sculptor studying in Italy and disillusioned by Old World cynicism. He repeated the theme explicitly in his 1877 novel *The American*, in which an American millionaire is defeated in his pursuit of European culture by the conventions of French aristocracy, and in his 1878 novella *Daisy Miller*, the tale of a spontaneous American girl in conflict with European codes of behavior in Florence. James reflected America's expanding cultural horizons in his use of foreign settings, but in the 1880s he interrupted the creation of "international novels," with which his fiction had become associated, and turned to the American scene. His *Washington Square* (1880) was a poignant psychological novel dealing with the effects of circumstance on character in New York, and *The Bostonians* (1886) was a satire of American bluestockings and suffragists.

James lived a remote personal life and never married. Always a detached realist, he was indifferent to politics and business in his fiction as in his life. His characters were upper class and his settings elegant—it has been observed that there are no bathrooms in James's fiction—but his stories analyzed primal emotions with keen, sometimes clinical, insight, and if he did not deal with the everyday reality of the common person, like Howells and HAMLIN GARLAND, his themes were universal. The novels, novellas, and short stories that flowed from his pen grew increasingly subtle, and his prose style grew increasingly complex and ambiguous in his later years, influencing a whole generation of modern writers that included

D. H. Lawrence, Edith Wharton, Joseph Conrad, and James Joyce.

—Dennis Wepman

**James, William** (1842–1910) *philosopher, psychologist*

William James, the brother of novelist HENRY JAMES, was born in New York City on January 11, 1842, the son of Henry James, a writer of religion influenced by the mysticism of Emanuel Swedenborg. Since inherited wealth enabled his family to travel widely, James's preparatory education included schools and tutors in Europe, making him fluent in French and German. His fragmented schooling inspired him to become either a painter or a scientist. A year spent in the studio of William Morris Hunt convinced James that he could not become a first-rate artist. He therefore entered the Lawrence Scientific School at Harvard in 1861, where he studied chemistry and physiology, and Harvard Medical School in 1864. Further travel necessitated by poor health postponed his medical degree until 1869. Hampered by poor eyesight and a weak back and beset by doubts and fears, James soon fell into a deep and severe depression, almost losing the will to live (although he continued to read voraciously). He was rescued from the illness by a newfound and passionate belief in the freedom and power of individual will that was to characterize his thinking as a psychologist and philosopher. Embracing free will meant rejecting scientific, theological, and metaphysical determinism.

In 1872 James joined the Harvard faculty as an instructor in physiology, which as a branch of biology immersed him in the theory of evolution, while the physiology of the nervous system pushed him into psychology. In 1890, after years of study and association with European psychologists, James published his *Principles of Psychology*. He was an empiricist, believing the mind was shaped by experience, but he opposed the biological and environmental determinism of WILLIAM GRAHAM SUMNER and Herbert Spencer. He believed the mind was active, engaged, interested, and free to experiment with and alter some of life's circumstances. To the question "Are we automata?" he gave an emphatic "no," as he rejected scientific materialism. *The Principles of Psychology* was enormously popular as much for its readability as for its ideas. James was adept at utilizing illustrations, metaphors, humor, and plain language to present complex ideas clearly.

With wide exposure came great influence. An abridged textbook version of *Principles of Psychology* was published in 1892, and in 1898 James brought out *Talks to Teach-*

William James (Library of Congress)

ers on *Psychology*. Both books were used extensively by future teachers in colleges of education. James knew that children needed knowledge and skills, but he believed that the specific skills, the manner of learning, and the pace and sequence of instruction should be determined by the special nature of both childhood and the individual child. James, however, did not advocate that children should determine what, when, or how they learned, but rather that sensitive teachers should be aware of many simultaneously occurring instincts in children. They should seize these instincts, such as pride or desire for personal gain, and build lessons that would lead to powerful and positive habits. After reading the *Principles of Psychology*, John Dewey was convinced that creative intelligence could change the world, and when this progressive thinker gathered like-minded educators about him at the University of Chicago, James exclaimed, “A *real School*, and *real Thought*. Important thought, too!”

In 1880, since psychology was regarded as a branch of philosophy, James joined that department. He acknowledged the relationship between the two (although he

believed that the science of psychology was a separate discipline) and maintained an interest in both studies. After the *Principles of Psychology* appeared, James’s attention turned more to religion and philosophy, and in 1897 he changed his title to professor of philosophy. His interest in religion was psychological, not theological and not in doctrines but in the phenomena of religious experience. Approaching religion as an empiricist, James concluded that although life after death was unproved (his attempts at psychic research yielded no positive results), the record of religious experience—the fruitful moral effects of the practice of religion—pointed to the existence of God. His *Varieties of Religious Experience* (1902) was extremely popular, largely because its scientific approach reassured those who adhered to a mystical faith.

James, however, is chiefly renowned as the philosopher of PRAGMATISM. He first used the term in 1898 when, while lecturing at the University of California at Berkeley, he argued that the meaning of all ideas are in their consequences, and over the next decade he elaborated on this theme. He observed that we deal not with the reality of truth but with our changing perceptions of the reality of truth, that truth is relative, workable, unfolding, and advancing. Ideas should be judged not by their relationship to moral absolutes like truth or goodness but by their consequences. James’s pragmatism was implicit in his empiricism and stress on experience, his belief in free will and rejection of determinism, and his hostility to absolutes and embrace of a pluralistic universe. The subtitle of his book *Pragmatism: A New Name for Old Ways of Thinking* (1907) was appropriate.

James’s pragmatism was easily accepted in a rapidly evolving, growing, competitive American society. His philosophy rejected prejudiced or fixed views and promoted the analysis of experience in determining what worked in personal lives and social institutions. Solving problems and answering human needs took precedence over traditional beliefs and practices, and pragmatism became the tool for achieving goals. An antidogmatic philosophy, James’s pragmatism has not become a rigid doctrine, but it has encouraged the development of new, original ideas. He died on August 26, 1910.

### Jefferson, Joseph, III (1829–1905) actor

Joseph Jefferson III was born on February 20, 1829, in Philadelphia, Pennsylvania, the son of Joseph Jefferson II and Cornelia Frances Thomas Burke, actors. His grandfather,

the first of that name, was a noted comic actor who immigrated to the United States in 1795, and his father worked as a manager and scene painter as well as an actor. Jefferson made his first appearance on stage at the age of three in a crowd scene and the next year performed in a minstrel show in Washington, D. C. His education was limited entirely to his apprenticeship in the theater, accompanying his family on tours throughout the South and into Mexico. After his father died in 1842, the family continued performing, but Jefferson returned to Philadelphia alone and joined a stock company at the age of 17. Three years later he made his first appearance in New York. In 1850 he married Margaret Clements Lockyer, who died in 1861 after bearing four children.

Jefferson worked steadily as an actor and a stage manager in Philadelphia and several southern cities. In 1858 he had a major success starring in Tom Taylor's comedy *Our American Cousin*, a vehicle in which he helped eliminate the theatrical stereotype of the boorish Yankee. After his wife's death, he traveled to California and then worked for several years in Australia. In 1865 he toured South America and England.

It was in London that he resumed a professional connection with the popular American playwright Dion Boucicault and proposed a new dramatization of Washington Irving's classic *Rip Van Winkle*. In collaboration, the two produced a version that provided Jefferson with a role that he was to play for the rest of his life. A hit in London, the play traveled to New York in 1866 and found a warm welcome. The next year he remarried. His second wife, Sarah Warren, was the daughter of a popular comic actor, William Warren. The couple had three children.

Jefferson's dedication to his craft impelled him to undertake a variety of roles. In 1875 he and his family traveled to England, where they spent two and a half years and where he created a memorable interpretation of Bob Acres in Richard Brinsley Sheridan's 18th-century play *The Rivals*. His limber frame and mobile face enabled him to run the gamut from tragic melodrama to broad physical comedy, but his reputation was solidly based on his restrained and easygoing portrayal of Irving's archetypal ne'er-do-well Rip. His performance of that role is credited with marking a turning point in American theatrical style, from the formalism of the 19th century to the relaxed naturalism of the modern era. In 1890 Jefferson published his *Autobiography*, which discussed his craft in perceptive detail and has become a classic of stage history.

Jefferson earned a large fortune and owned homes in Massachusetts, Florida, and Louisiana. In his spare time, he was also an avid and skilled impressionist painter and exhibited at the Pennsylvania Academy of Fine Arts in 1868 and the National Academy of Design in 1890. Honored both professionally and socially, he was made president of

the Players Club in 1893 and did much to elevate the status of the acting profession. Jefferson died on April 23, 1905, in Palm Beach, Florida.

### **Jewett, Sarah Orne** (1849–1909) *writer*

A great, early American realist writer, Sarah Orne Jewett was born in South Berwick, Maine. Her father, Theodore Herman Jewett, was a country doctor, and her mother, Caroline Frances Perry, was the daughter of William Perry, a renowned surgeon. Suffering from rheumatoid arthritis, young Jewett, who had both an older and a younger sister, graduated in 1865 from Berwick Academy, even though she often missed school. She read widely in her family's bountiful library and often accompanied her father on visits to his scattered patients. He encouraged her to observe their surroundings and to "write about things *just as they are*." She followed his advice and became so well acquainted with their region and its people and wrote of them so sensitively that in her writings they became "part of life itself."

Jewett had a story accepted by the *Atlantic Monthly* in 1869. Influenced by the regional description in Harriet Beecher Stowe's *Pearl of Orr's Island* and indignant when the "city boarders," who began arriving in Berwick, made fun of the "awkward, ignorant" country people, Jewett determined to portray to the world their abilities and their "grand, simple lives." She wanted her readers to "wonder at the . . . human ability in this world" and to be shocked at its wastefulness.

After corresponding with *Atlantic* editors James T. Fields and WILLIAM DEAN HOWELLS, she began in 1873 a series of Maine sketches for the *Atlantic*, which were reprinted four years later in *Deephaven*, her first major collection. It established her, at the age of 28, as a leading New England writer. "You've got an uncommon feeling for *talk*," Howells wrote encouragingly, "I *hear* your people." The sketches Jewett wrote in the following decade were collected in *A White Heron and Other Stories* (1886). All together Jewett would publish 19 books in her lifetime, mostly collections of sketches of country life, but also including novels, children's stories, and a child's history of the Normans.

Although Jewett, who never married, lived in the handsome pre-Revolutionary house that her shipbuilding grandfather had purchased in Berwick, she often visited friends in Boston and other cities. Among these friends were the Fields and Howells families and well-known writers of her time. These included Julia Ward Howe, Henry

Wadsworth Longfellow, James Russell Lowell, CHARLES ELIOT NORTON, John Greenleaf Whittier, and many European intellectuals. After her father's death in 1878 Jewett's life revolved even more around these friends, especially Annie Adams Fields, a prominent literary hostess and wife of Jewett's early editor, who died in 1881.

In 1896 *The Country of the Pointed Firs*, with its 20 tales from a city boarder's visit to the coastal Maine village of Dunnet Landing, was serialized in the *Atlantic*. Considered a masterpiece from the start, *Pointed Firs* placed Jewett solidly among the great. Asked to name three American novels "deserving of a long, long life," Willa Cather, an acclaimed novelist herself, named *Pointed Firs*, Nathaniel Hawthorne's *The Scarlet Letter*, and Mark Twain's *Huckleberry Finn*. Sympathy, Cather claimed, was the source of Jewett's greatness. Jewett managed to fade away "into the land and people" she wrote about. British author Rudyard Kipling called her book "the very life."

Noted for its rich account of women's lives and voices, *Pointed Firs* was written about the early machine age, when, with its earlier losses from whaling and the West Indian trade, coastal Maine was still a matriarchal society. Like the book's main character, Almira Todd, a practicing herbalist, and an unnamed female narrator, Jewett is an observer, who sees beyond external facts to create a larger whole from them and casual conversation. With their hearts in sync, Todd and her mother, Mrs. Brackett, show how close a mother and daughter can remain, even when the mother lives a distance offshore on Green Island. Despite their physical separation, they seem to know and understand what the other is thinking. Even though she lives on Green Island, 86-year-old Mrs. Brackett remains the queen of the family, as proven by the faces that light up when she appears at the Bowden family reunion, the central image of community in these sketches. Though often alone, women are not tragic. They live in a world where they learn to belong, a world whose men are also memorable.

Especially noteworthy among these seafarers are four old survivors of an earlier generation. They had "gone together ever since they were boys" and knew "most everything about the sea amon't them." One is "heavy-headed" Elijah Tilley, who emerges from "his dark fish house . . . carrying a small haddock." His sea activities color his days on shore. While plowing, to avoid the heavy rocks in his cultivated field he marks them with lobster-pot buoys, and near his footpath "a heavy piece of old wreck timber" is buried "like a ship's bone." When speaking of his approaching death, Tilley declares, "I sha'n't trouble the fish a great sight more."

Her friendship with Annie Fields sustained Jewett during the remaining decades of her life, when her great talent matured. They spent half of each year in each other's company and made four trips to Europe, where they vis-

ited Alfred Lord Tennyson, Matthew Arnold, and HENRY JAMES.

Jewett was the first woman to receive a Litt.D. from Bowdoin College (1901). The next year, on her 53rd birthday, she had a spinal concussion when her horse shied on a hill and threw her from her carriage. Jewett's writing career ended. She died seven years later, after suffering a paralyzing stroke, still living in her grandfather's great house.

### Jim Crow laws

Segregation (or Jim Crow, so named after a racially stereotyped minstrel show character) existed prior to the Civil War, but it was not systematic. Many hotels excluded blacks, and most churches had balconies or separate pews for AFRICAN AMERICANS. With the emancipation of slaves following the Civil War, the custom of segregation continued as communities formed dual school systems to maintain the status quo. The Civil Rights Act of (1875) did not try to integrate schools, but it did call for the integration of public facilities. The voiding of that desegregation law by the U.S. SUPREME COURT in the 1883 *CIVIL RIGHTS CASES* in effect encouraged discrimination. Nevertheless, Jim Crow—segregation—laws were rare in the South before the 1890s and became prevalent at the turn of the century. Indeed, Virginia did not separate the races on the state's railroads prior to 1900. Nor were the state's streetcars segregated by race, and despite discrimination, blacks generally were not barred from or segregated in bars, waiting rooms, theaters, or other public venues. Excepting churches, schools, and railroad cars, most areas in the South did not practice either de facto or de jure segregation prior to 1897.

The *PLESSY V. FERGUSON* Supreme Court case in 1896 set into motion the concept of legally separating the races in public arenas. The Court upheld the 1890 Louisiana Jim Crow law requiring that railroads provide "equal but separate accommodations for the white and colored races." Not all southern whites demanded Jim Crow laws: South Carolina resisted establishing Jim Crow cars before 1898, and the conservative editor of the *Charleston News and Courier* considered such a law absurd. He noted sarcastically that a Jim Crow car would logically call for Jim Crow railroads, passenger boats, waiting rooms, eating halls, jury boxes, as well as a Jim Crow Bible for court procedures and even two or

three Jim Crow counties for blacks. But in time his sarcastic absurdities became realities as nearly all his examples were adopted by southern legislatures. In 1898 South Carolina enacted a Jim Crow car for first-class coaches and two years later amended the law to include second-class coaches. Jim Crow streetcars were established by North Carolina and Virginia (1901); Louisiana (1902); Arkansas, South Carolina, and Tennessee (1903); Mississippi and Maryland (1904); Florida (1905); and Oklahoma (1907). Other Jim Crow statutes separated whites and other races in public facilities such as libraries, concert halls, parks, and railroad and bus terminals. Eventually, Jim Crow was applied to churches, housing, employment, sport teams, hospitals, orphanages, cemeteries, funeral homes, morgues, and places of entertainment, and throughout the South, “white only” or “colored only” signs were strictly enforced.

These signs were particularly humiliating to African Americans and liberals. Beginning in the 1950s, civil rights activists protested against Jim Crow laws by sitting in at lunch counters, wading in at swimming pools, and supporting economic boycotts of businesses that supported Jim Crow enforcement. These odious laws remained in effect until the passage of the 1964 Civil Rights Act, which prohibited discrimination in all public facilities.

## jingoes

In the late 19th century, the descriptive term *jingoes* applied to those who displayed an intense, unquestioning patriotism while advocating an aggressive FOREIGN POLICY. In 1878 the term was used in England to describe the followers of Prime Minister Benjamin Disraeli, who sought to use the British fleet to check the Russian advances in the Black Sea. The group adopted a theme song whose refrain went:

We don't want to fight, but, by jingo, if we do,  
We've got the ships,  
We've got the men,  
We've got the money, too.

The “jingo” tag soon began to be used pejoratively in the United States for aggressive imperialists who would go to war to acquire overseas territories and naval bases. The opponents of the jingoes thought them manic, impulsive, possessed of limited intelligence, and oblivious to the consequences of war.

## Johnstown flood (May 31, 1889)

On May 31, 1889, the South Fork Dam in western Pennsylvania broke, pouring 20 million tons of water downstream, inundating Johnstown 15 miles below, and killing approximately 2,200 people. The flood and its aftermath demonstrate dominant themes of the Gilded Age: The doctrine of laissez-faire, very much in vogue, discouraged government inspection or regulation of the dam. Belief in individualism enabled people to do as they wished with their property, even to the point of endangering others. Casualness bordering on callousness was rampant. The owners of the poorly maintained South Fork Dam were wealthy and prominent Pittsburghers who were never held accountable for their carelessness. But when the disaster struck, ordinary people proved to be heroes, and a spirit of cooperation prevailed as almost everyone put aside their personal losses and cared for the injured, buried the dead, and cleared the debris. Warmhearted people from all over—even other countries—contributed more than \$3.7 million and trainloads of provisions.

Originally part of Pennsylvania's Main Line canal system, the South Fork Dam had been built to supply the canal west of Johnstown with water during the dry summer months. It was soon rendered obsolete by the Pennsylvania Railroad, fell into disrepair, and was in 1879 acquired and inadequately patched up by the South Fork Fishing and Hunting Club (among its members were ANDREW CARNEGIE and HENRY CLAY FRICK).

Following an extremely heavy rainfall, the dam broke and water cascaded down the narrow valley, devastating Johnstown in 10 minutes. Houses were swept off their foundations and split apart; their inhabitants hurled about or clinging to the debris that lodged in a massive jam at the stone railroad bridge on the downstream side of town. More than 500 people who had not been drowned or crushed were tangled in the debris. Rescue work proceeded slowly because few tools were available, and that evening the debris caught fire and as many as 80 men, women, and children perished.

Those who survived the flood and the fire awoke on June 1 to a dismal day but coped with the disaster. Rafts were built to aid in rescue operations, and committees were formed to bury the dead and care for the injured. The next day a relief train arrived from Pittsburgh, and by that night more than 1,000 doctors, undertakers, workmen, and newspapermen had come. Clara Barton and her newly organized Red Cross soon arrived and remained for five months rendering aid to people in need. Andrew Carnegie also came and characteristically promised Johnstown a new library. Life in time returned to normal. Not one cent, however, was realized from the damage suits that followed the flood.

## Judaism

Jews and Judaism have played an important role in American history since the colonial period, but the last third of the 19th century was a time of great growth and change. In 1850 a “dignified orthodoxy”—established by the early Sephardic communities—prevailed in American Judaism, but by then the German Ashkenazim were in a majority. IMMIGRATION swelled their numbers enormously in the next decade as the Jewish population rose from 50,000 to 160,000. Immigrants escaped from oppressive societies, but they also left their close-knit, traditional religious communities to spread out in a land of toleration where they were more susceptible to change.

Indeed, change was already in the air in Europe. Paralleling the 18th-century Enlightenment, the Haskala, or Jewish Enlightenment, arose in Germany, and from it Reform Judaism emerged as a movement. Its 19th-century proponents, eager to encounter modern life, were either looked to by the American-German Jewish community for guidance or personally came to America to try out their ideas. Of these, David Einhorn and Isaac Mayer Wise were the most prominent. Einhorn, who served as leader of the new movement in Germany and Hungary, came to Baltimore, Maryland. With his arrival in 1855, the new Reform ideas—which approached Judaism from a scientific viewpoint, rejected ceremonial law (dietary restrictions, for example), and interpreted moral law by contemporary standards—spread rapidly. Within a generation, largely due to the efforts of Isaac Mayer Wise, the overwhelmingly Sephardic orthodox culture of Judaism had become just as overwhelmingly German reform.

Wise came to the United States in 1846. During his first rabbinate in Albany, New York, his liturgical changes divided the congregation, and in 1854 he began his rabbinate in Cincinnati. There he turned to publishing (two magazines and many books) to promote his radical religious ideas and to organize their adherents. In 1873 he founded the Union of American Hebrew Congregations, which by 1880 was the closest any group ever got to dominating American Judaism. Wise served as president until

his death in 1900. The high-water mark of Reform Judaism came in 1885 with the 18-point Pittsburgh platform, which Einhorn heavily influenced and Wise called “the Jewish Declaration of Independence.” The platform laid out the principles of Reform Judaism that endured through the late 20th century.

Judaism shifted again near the end of the 19th century, owing chiefly to the next wave of immigration from the eastern European Ashkenazic community. With renewed persecution in Russia, Poland, and the surrounding areas, the resulting immigration doubled the number of synagogues in the United States between 1880 and 1890. These Jews were far more sequestered from the world than the German Jews two generations before, and they brought a whole culture with them. With their Yiddish language and a folk piety formed within the shtetls of the pale—often Hasidic or tinged with Hasidism—these Jews did not connect with the Reform Jewish community. Indeed, their presence led to a resurgence of Orthodox Judaism.

While these immigrants clung vigorously to their culture, their children were often eager to assimilate in American society. Growing secularism, beginning in Europe and growing in America, led to Zionism, which was a nonreligious Jewish response to anti-Semitism, although it was a Reform rabbi, Stephen Wise, who founded the Federation of American Zionists in 1898. These same secular forces strengthened the ETHICAL CULTURE MOVEMENT, a nontheistic religious organization founded by Felix Adler in 1876, which had its intellectual and cultural origins in Judaism but dissociated itself from that tradition almost entirely.

In 1900, when Isaac Mayer Wise died, Judaism was about to become tripartite in form: Orthodox, Reform, and Conservative. In the space of merely 50 years, the most ancient faith of Abraham, Isaac, and Jacob had changed more than any other religion in America.

## kindergarten

The origins of the kindergarten movement of the late 19th century derive from a fundamental change in how Europeans envisioned and understood young children. The traditional view—that children were tainted by the original sins of Eve and Adam and thus were depraved and best governed by strict authority—was attacked by John Amos Comenius (1592–1670), John Locke (1632–1704), Jean-Jacques Rousseau (1712–78), and Johann Pestalozzi (1746–1827). These humane philosophers and educators argued that children are innocent, impressionable, and capable of being educated without harsh discipline by skillful teachers who understand their intelligence and emotional capabilities. Children are thus best prepared for school in homes where love rather than unwavering discipline prevails. In 1837 Pestalozzi's pupil Friedrich Froebel (1782–1852) established in Germany a kindergarten for little children that emphasized games, social activities, art, music, and physical movement. Froebel and like-minded early-childhood educators believed that literacy skills and arithmetic were more effectively introduced between the ages of six and eight.

Inspired by Froebel, Margaretha Schurz (wife of reformer CARL SCHURZ) in 1857 started a kindergarten in Watertown, Wisconsin, and others soon sprang up. Between 1870 and 1900 kindergarten classes were established in many publicly supported urban and rural schools, but they usually failed to realize Froebel's ideas. In rural one-room schools with 10–20 students, the five-year-old kindergartners were thrown in with all ages and grades (up to 14–16-year-old eighth-graders) and were often ignored while the teacher prepared older students in demanding subjects for state examinations. Teacher turnover was high, with 90 percent spending less than five years in any one school, and teachers normally were young and inexperienced, with only two or three years of education beyond the eighth grade. They were hired by local school boards and were occasionally observed and evaluated by state officials. In urban schools or towns large enough to operate

a graded school, the kindergarten children were assigned their own teachers (whom principals evaluated frequently) and had special rooms and learning materials.

When parents sent children to public kindergarten, they took the first step in a transition from family-controlled to state-controlled education. Henceforth, while parents retained the responsibility of feeding, clothing, and maintaining the health of their children, the schools would try to educate them according to their merit for independent, self-reliant behavior. Indeed, if families failed to develop proper health habits or instill moral training in their children, the schools at least would get them off the streets, rid their heads of lice, improve their posture through scoliosis inspection, and develop their characters while teaching them basic skills. In the late 19th century, kindergartens were the beginning of eight to 10 years of schooling for the typical child, 95 percent of whom then went out to work for the rest of their lives.

## King, Clarence (1842–1901) geologist

Clarence Rivers King—American geologist and founder-leader of federal surveys—was born in Newport, Rhode Island, on January 6, 1842. King's mother raised and educated him after his father died at Amoy in 1848 while in the China trade. With his stepfather's aid, King attended Yale (Ph. B., 1862). From 1863 to 1866 he worked throughout California with Josiah Whitney's state-sponsored geo-

logical survey until he became solely responsible for his twice-widowed mother, two stepsiblings, and eight other persons. In 1867 King returned east and won approval for his U.S. Geological Exploration of the 40th parallel sponsored by the Army Corps of Engineers. By 1872 King and his men had mapped and assessed the geology and mineral resources of a 100-mile swath of land flanking the transcontinental railroad between California's Sierra Nevada and Colorado's Front Range. In 1872 King earned national renown by exposing a cunning "diamond hoax" in Colorado and publishing *Mountaineering in the Sierra Nevada*, a volume of stories real and imagined based on his years with Whitney. King's episodic interpretations of geologic history and organic evolution (1877) clashed with the gradualist views of his friend and collaborator, Yale paleontologist OTHNIEL CHARLES MARSH.

In 1878 King completed *Systematic Geology*, his synthesis of the 40th-parallel studies, and strove to establish a national federal survey that would consolidate the missions of his organization, one led by JOHN WESLEY POWELL, and two others also examining the public domain. As a member (1876) of the National Academy of Sciences (NAS), King advised Marsh's NAS committee, which was charged by CONGRESS to plan for reforming the federal mapping and scientific surveys. At Interior Secretary CARL SCHURZ's request, King cowrote legislation based on the NAS plan. King and Powell promoted its passage by Congress on March 3, 1879; a month later, King became director of the new U.S. GEOLOGICAL SURVEY (USGS). He and Powell also served on the Public Lands Commission, authorized by the same statute.

Congress and President RUTHERFORD B. HAYES established the USGS principally as a bureau of practical science to help the mineral industry aid the nation's reviving economy by eliminating shortfalls in gold and iron production. Although the USGS's initial appropriation was only two-thirds of that of the three surveys it replaced, King immediately launched the new agency on a scientific program of applied economic geology (as mandated) and supporting basic studies (to provide new discoveries to apply). He also cofunded and participated in cooperative investigations for the 10th census.

While leading the USGS, King continued to display professional brilliance, personal magnetism, a natural style of command, and a genuine sympathy for everyone who worked for him. He intended to remain as director, however, "only long enough to appoint its staff, organize its work, and guide the force into full activity." The agency's ethics clauses prevented King from mining investments or consulting within the United States, activities that would yield the larger income he needed to support his family and his lifestyle. In March 1881, after recommending Powell as his successor, King resigned as director. Soon, as King

noted with dismay, Powell deemphasized practical science and turned the USGS into an agency for topographic mapping and general geology.

King returned to New York City, his professional and social base, where he had been a spellbinding raconteur in the Century Club since 1876. Thereafter, with mixed success, King promoted mines in Mexico, ranches in Wyoming, a bank in Texas, and other ventures. King returned often to Washington, where he, Marian and HENRY ADAMS, and Clara and JOHN MILTON HAY sometimes convened their informal "Five of Hearts Club." From 1888 King also led a second life in Brooklyn in a loving but clandestine common-law marriage to Ada Todd, a black nursemaid who bore him five children. In 1893 King published his estimate of the Earth's age, but a nervous breakdown ended his hope of resuming leadership of the USGS. The financial panic later that year destroyed King's resources, leaving him hopelessly in debt to Hay. King refused continued offers from academe or additional help from Hay and resumed active work as a mining consultant. These efforts increasingly damaged his health. Tuberculosis forced King to California and then to Arizona, where he died on December 24, 1901.

## Klondike gold rush

The gold rush era in the United States began in California in 1848 and continued through 1900. Although miners searched for the valuable metal well into the 20th century, the Klondike gold rush, from roughly 1897 to 1900, was the last of the major rushes to occur where independent prospectors flocked to a region in the hopes of "striking it rich." The epicenter of the Klondike gold rush was up the Yukon River just over the Alaskan border in Canada, and close to Dawson City; to reach it, hopeful prospectors opened up the Alaskan frontier.

The United States acquired Alaska in 1867, but it was basically unknown and unsettled until the late 1890s, when large numbers of prospectors poured into it in search of gold. Although the town of Juneau, Alaska, was established in 1880 after gold was found there (and in the Canadian Yukon in the mid-1880s), the major "strike" occurred in August 1896, when the son of a California forty-niner found gold while panning in Rabbit Creek, which soon became known as "Bonanza Creek."

Prospectors from the Canadian Yukon rushed up to Bonanza Creek and began staking claims along the creek

Gold miners and packers on Dyea Trail, Alaska, ca. 1898  
(Library of Congress)

and in the surrounding area. Several prospectors during this initial period enjoyed gold yields that brought them more than \$1 million. News about the gold did not reach the West Coast and the outside world until the summer of 1897, precipitating a gold rush that followed the pattern of the California gold rush of 1849. Large numbers of men without women gave rise to vice and violence, vastly inflated prices for necessities that were brought in with difficulty, and the tendency for some prospectors to settle in the area permanently. Mining activity created Dawson City, and by September 1897 6,000–8,000 prospectors were already in the area near the head of the Yukon River.

Depressed economic conditions following the panic of 1893 heightened interest in the new gold fields, and by the end of 1897 thousands of hopefuls were on their way to Alaska. Many boarded transcontinental railroads for Seattle, Washington, the closest major city, to catch a vessel heading up the coast to Alaska. By 1898 Seattle was full of miners waiting for a steamship that would take them 2,000 miles northwest to the mouth of the Yukon River in the Bering Sea, then 1,300 miles up the Yukon to Dawson City. A late-arriving steamer in 1897 actually became stuck in the ice and had to wait until the following season to make it to Dawson City. Others took a boat to Juneau and then attempted the treacherous land route north, braving avalanches, crevasses, and the 1,500-square-mile Malaspina Glacier; many of these prospectors died.

Driven by rumors of gold elsewhere, many prospectors scattered across the vast expanses of the Alaskan tundra in search of the metal, moving as far north as the Arctic Circle in some instances. Historians estimate that 100,000 people journeyed to the Dawson City area in search of gold. In the summer of 1899 prospectors discovered gold in the sand on the beach near Nome, Alaska (an isolated area near the Bering Strait), which began another Alaskan gold rush. Steamers from Seattle were unable to penetrate the ice that had already formed late in the summer, and eager miners were forced to wait until the next season. Nome's population expanded to 18,000 by the time the gold rush ended. The Klondike gold rush, and to a lesser degree the rush to Nome, succeeded in opening up the "last frontier" (Alaska's nickname) of the United States and was the final opportunity for the amateur prospector to claim "poor man's gold."

## Knights of Labor

A group of Philadelphia garment workers led by Uriah Stephens organized the first local assembly of the Noble Order of the Knights of Labor (Knights) in 1869. They cloaked the society in rituals and secrecy (abolished in 1881 to placate opposition from the Roman Catholic hierarchy) to protect its members from discharge and blacklisting. At first, growth was slow, with a number of local assemblies forming district assemblies without much effort to coordinate activities. A rapid influx of members following the GREAT STRIKE OF 1877, however, necessitated the formation of a national organization.

In January 1878 delegates from the various district assemblies meeting in Reading, Pennsylvania, created the general assembly as the order's national legislative body and elected Stephens its executive director, or "grand master workman." The Knights opened membership to all productive people over the age of 18, including women and AFRICAN AMERICANS, but excluded saloonkeepers, bankers, lawyers, and stockbrokers. The inclusive membership was necessary, for the Knights' overarching goal was social reform. The organization lobbied for the abolition of CONTRACT LABOR and favored weekly pay laws and worker safety laws. It also called for government ownership of RAILROADS and telegraph lines and established producers' cooperatives. TERENCE V. POWDERLY, who replaced Stephens as grand master workman in 1879, and other leaders emphasized arbitration instead of strikes, which they dismissed as knee-jerk

reactions that could do little or nothing to ameliorate the condition of workers.

Ironically, the Knights grew and died by the strike. Membership increased from 100,000 to more than 700,000 after two successful strikes against the southwestern railroads in 1885, but the Knights lost more than 100,000 members after the same railroads defeated them in a strike the following year. Membership continued to decline, as the order was unable to win another important strike over the next two years. The order lost additional prestige among workers when it became known that Powderly, true to antistrike philosophy, refused to support the eight-hour movement sponsored by the trade unions.

Trade union hostility also contributed to the demise of the Knights. Skilled workers resented the Knights' organizational scheme of geographically based local units in which they were outvoted by unskilled workers and unable to dominate a trade. The Knights met these objections by permitting the formation of district assemblies based upon occupation, but skilled workers further resented Powderly's refusal to support strikes and began joining the resurgent trade unions of the AMERICAN FEDERATION OF LABOR (AFL). Soon open warfare between the two organizations (with each breaking strikes of the other) substantially weakened the Knights. By 1890 the producer cooperatives sponsored by the order, upon which it had pinned so much hope, had disappeared and many of its remaining members joined the Populist movement.

It would be a mistake, however, to write off the Knights as a failure. As a reform organization it achieved such significant legislation as the prohibition of imported contract labor, the creation of the Federal Bureau of Labor, and, in some states, the abolition of convict labor.

### Ku Klux Klan cases (1884)

The Ku Klux Klan began in 1866 in Pulaski, Tennessee, as a secret social club of former Confederate veterans. It derived its name from the Greek word *kyklos*, which means "circle." The Klan opposed Radical Republican Reconstruction by intimidating former slaves and their white

supporters with threats, beatings, and murders. Spreading rapidly, the Klan by 1867 had become "the invisible empire of the South," led by former Confederate general Nathan Bedford Forrest. The Klan was a formidable organization that helped restore white rule in North Carolina (1870) and Georgia (1871). In 1871 CONGRESS passed the Ku Klux Enforcement Act, which provided President Ulysses S. Grant with the authority to suspend the writ of habeas corpus, to suppress disturbances by armed force, and to fine terrorist groups.

THE SUPREME COURT, however, severely limited the effect of the Enforcement Act of 1871 as well as that of 1870. In *United States v. Cruikshank* (1876) it emphasized that the Fourteenth Amendment limited the actions of states but not the acts of individuals. That same year in *United States v. Reese*, the Court would not uphold the Enforcement Acts in local and state elections. The Court further reduced the effect of the Ku Klux Enforcement Act in *United States v. Harris* (1883) by holding that Congress did not have the power to legislate against crime within states.

The Court, however, did uphold the Ku Klux Enforcement Act in *Ex parte Yarbrough* (1884). Joseph Yarbrough and others were indicted under two sections of the Enforcement Act of 1871 for whipping and conspiring to prevent Barry Saunders from exercising a constitutional right to vote for a member of Congress. Yarbrough questioned the constitutionality of the law, but although the Supreme Court had emasculated the Enforcement Acts, *Ex parte Yarbrough* dealt with an individual denying a person the right to vote in a federal election. The Supreme Court ruled that Congress had the right to protect persons who vote for members of Congress from intimidation or violence and to punish as a crime the interference by any individual with another person's right to vote in federal elections. Based on this decision, Yarbrough and others were denied a writ of habeas corpus and were sent back to jail. The *Yarbrough* case, however, was exceptional and had no effect on the intimidation of black voters in the South by white supremacists.

—William Seraile

### labor, child

The number of children under age 16 working in nonagricultural pursuits doubled between 1890 and 1900. Children that age composed 13 percent of the cotton industry's workforce in 1900. Boys under 16 almost exclusively filled three occupations—slate picker, door tender, and mule driver—in the anthracite coal mining industry. Children worked in canneries, glass factories, and most other industries. Some worked in the streets selling newspapers and shining shoes. Others, particularly immigrants, worked with their families in sweatshops that often doubled as their living quarters.

Employers hired children because they were cheap labor. A slate picker in the anthracite mines earned between six and 10 cents an hour. Canneries paid children less than 14 years of age 2.5 cents an hour. When paid, youngsters in sweatshops received between one and two cents an hour. Cotton mills might pay an “experienced” 12-year-old five cents an hour. Some mills would give kids the opportunity to gain experience by allowing them to work without pay for a probationary period of up to six weeks. At the end of the period they would often be fired and replaced by another batch of eager learners.

Children worked long hours for their meager pay. A workday of 14–16 hours was common in the sweatshops. Canneries worked at least 12 hours during peak season. The workday varied between 10 and 12 hours in other industries. Supervisors kept the children working constantly though the day with shouts, curses, and, if necessary, corporal punishment. Some overseers held smaller children by their feet out of a window, threatening to drop them unless they behaved; other overseers simply beat the children with a rod or whip.

Children often resisted oppressive behavior. On an individual level they would throw stones or spit on abusive bosses when they were not looking. Supervisors were targets of practical jokes. Some were not above sabotaging machines to gain time to rest or play. Children also participated in concerted activities. Anthracite breaker boys,

for example, would quit work collectively to go sleighing or swimming. The boys at a colliery in Moosic, Pennsylvania, refused to return to work until an objectionable boss was replaced. In 1899 newsboys refused to sell copies of the *New York Journal* and the *New York World* when the publishers increased the wholesale cost of their papers by 10 cents per 100 without a corresponding increase in the

Young boys were often a source of cheap labor in the mining industry. (Library of Congress)

retail price. The strike ended with a compromise after two weeks: The new wholesale rate remained, but the publishers agreed to refund the price of all unsold copies. A strike of New York messenger boys earlier that year, however, failed because of poor organization.

With the exception of the United Mine Workers of America, which organized boys into separate local unions, trade unions did not attempt to recruit children, whom they regarded as cheap competition. Consequently, unions did join with reform groups in lobbying for laws that would make the employment of children cost prohibitive.

One reform tactic was to increase the number of years of compulsory EDUCATION. As with many reforms, compulsory education addressed several concerns: It would Americanize immigrant children by teaching them English and giving them “correct” values while keeping children out of the workplace. But although the public schools proved effective instruments of acculturation, compulsory education failed to end child labor. Yielding to pressure from employers, school districts established special night schools for working children.

Labor unions and reformers also lobbied for laws restricting the hours a child could work. By 1900 eight states prohibited children from working at night. Most northern states mandated a 10-hour day and 60-hour work week for children. Many states also established a minimum age for industrial work.

The minimum-age laws, however, had little effect. Seeking cheap labor, employers did not inquire too closely into the ages of young people applying for work, and children lied about their ages with the blessings of their parents. Economic necessity forced many parents to make their children work. Wages were so low that most working-class and lower-middle-class families could not subsist on one income.

Technology, not laws, forced a decline in child labor. In the 1890s, mechanical devices began eliminating the need for door boys and slate pickers in anthracite coal mining, and the adoption of electric haulage locomotives eliminated the need for mules and their drivers. But children continued to work in industries where machinery could not perform their normal tasks. As late as 1938, many southern cotton mills employed children under the age of 16.

## labor, radical

Labor radicals wanted to transform the Gilded Age society from one based on economic individualism to one based

Reproduction of an anarchist handbill distributed prior to the Haymarket riot of 1886 (Library of Congress)

upon common ownership of property managed for the common good. However, radicals disagreed on strategy and tactics. Socialists realized that political power would be necessary to eradicate private property, but they disagreed over how to gain control of the state. One group adhered to the principles of the German socialist, Ferdinand Lassalle, which held that manhood suffrage would permit workers to gain control of the state through the electoral process. Until then, the Lassalleans would use the electoral process to win immediate goals such as the eight-hour day and low-interest loans to establish cooperatives.

The followers of Karl Marx argued that a government reflected the social order it was designed to protect, so workers could not gain control of the bourgeois state through the ballot. Their only alternative was to destroy it and replace it with a “dictatorship of the proletariat” before they could establish communism. Although the Marxists used electoral politics for agitation and propaganda purposes, they emphasized organizing workers into revolutionary unions. But Marxists could not agree on tactics. Should

they capture existing labor unions, or should they establish their own? Marxist trade-union leaders such as Peter J. McGuire of the carpenters wanted to “bore within” the AMERICAN FEDERATION OF LABOR (AFL) to convert it and its affiliated members to socialism. However, SAMUEL GOMPERS, president of the AFL and a firm believer in pure and simple unionism, defeated their efforts. Socialists in 1893 also failed to capture the KNIGHTS OF LABOR. Although they dominated District Assembly 49 in New York, they only succeeded in electing James P. Sovereign, a farm editor from Iowa, as president of the Knights. Frustrated by the failure of the “boring within” tactic, Daniel De Leon, leader of the SOCIALIST LABOR PARTY (SLP), in 1895 launched a purely Marxist union, the Socialist Trade and Labor Alliance. De Leon also ordered SLP members not to accept offices in other trade unions, but that tactic forced many trade unionists to join the Lassalleian SOCIALIST PARTY.

Another radical group, the anarchists, disagreed with both the Marxists and Lassalleans. They maintained that all government had to be destroyed before a true communal society could be established. American socialists with anarchist tendencies formed the Social Revolutionary Party in 1881. The following year they acquired a powerful spokesman, Johann Most. Expelled from the German Socialist Party for his radicalism, Most immigrated to America, where he became editor of the weekly New York *Freiheit*. Most’s editorials condoned “propaganda by deed,” or terrorism, including assassination, as a way of galvanizing the working masses into revolutionary action. In 1887 Most played an important role in the formulation of the so-called Pittsburgh Manifesto, which denounced the state as an instrument of tyranny and dismissed political action as an exercise in futility. The Pittsburgh meeting also created the American section of the International Working People’s Association, the “Black International” (black being the color of anarchism and red the color of socialism), which soon claimed 8,000 members. In addition to the *Freiheit*, the anarchist press in America consisted of the Chicago *Arbeiter Zeitung* and later the *Alarm*, the Boston *Anarchist*, and the St. Louis *Voice of the People*.

The Chicago anarchists tended to be anarcho-syndicalists, or those anarchists who favored the creation of labor unions (syndicates) as the primary instruments of revolution. In 1884 they helped form the Central Labor Union, which preached open rebellion against capitalists. It quickly became embroiled in a fight for control of Chicago’s labor movement with the central body of the trade unions, the Amalgamated Trades and Labor Assembly. Both sides embraced the eight-hour-day issue as an organizing device. The violent rhetoric on its behalf by the anarchists directly contributed to the HAYMARKET RIOT and the subsequent

antiradical witch hunt that led to the execution of four anarchists in 1887.

Five years later another violent act increased American abhorrence toward anarchism. Angered by the HOMESTEAD STRIKE, a New York anarchist, Alexander Berkman, aided by Emma Goldman, decided to assassinate HENRY CLAY FRICK. The assassination attempt failed, but this propaganda by deed turned public opinion against the Homestead strikers. Ironically, Johann Most did not approve of Berkman’s action, and for that repudiation he was horse-whipped by Emma Goldman, his former lover and Berkman’s current one.

## labor: strikes and violence

The history of American labor-management disputes is the most violent in the world. Labor violence can best be understood when placed within the context of rights. Workers believed that by joining a union and conducting strikes, they were exercising their right to improve themselves and protect their families. Managers, on the other hand, regarded the demand that employees be granted some control over their working conditions as an invasion of their property rights.

Management employed different strategies to keep a union off its property: It could compel workers to sign a “yellow dog contract” stating they would never join a union as a condition of employment. Or, it could hire private detective agencies to spy on workers and identify labor agitators so they could be fired before organizing a union.

The Pinkerton Detective Agency was the best-known and most feared antilabor force in America during the last third of the 19th century. Founded in 1850 by Allen Pinkerton, the agency amassed the world’s largest collection of mug shots by 1870 and supplemented the pictures with a large database on criminals and their activities. Pinkerton agents infiltrated a company’s workforce with the goal of identifying discontents and sowing discord in established unions. These “Pinkertons” were involved as labor spies, agent provocateurs, or guards in the Anthracite Strike of 1875, the Iron Moulders Lockout of 1883, the Burlington Railroad Strike of 1888, the New York Longshoremen’s Strike of 1887, the COEUR D’ALENE MINERS’ STRIKE of 1892, the HOMESTEAD STRIKE of 1892, as well as in other strikes.

Local authorities not only quelled labor disturbances but also attacked peaceful demonstrations. On December 11, 1887, New York police attacked and brutally beat members of an unarmed crowd of 7,000 as they prepared

Illustration of strikers facing off against Pinkertons in *Frank Leslie's Illustrated Weekly*, July 1892 (Library of Congress)

to parade through the city to demand jobs for the unemployed. In 1897 a sheriff's posse shot into a crowd of more than 200 unarmed miners as they peacefully marched down a public highway in Lattimer, Pennsylvania, killing 19 people, most of whom were shot in the back as they ran away.

However, management could not always trust local authorities, who often were elected by workers. During the GREAT STRIKE OF 1877, officials of the Lackawanna Coal and Iron Company, fearful that the city police would sympathize with the strikers, had the mayor of Scranton deputize 40 of its trusted employees as a special police force. Armed by the company and instructed by its commander, the company superintendent, "to shoot low and shoot to kill," the Special Police fired into a crowd, killing six and wounding 55. The creation of a special police force in Scranton actually was unnecessary, for in 1869 the Pennsylvania legislature gave railroad and coal companies the power to maintain their own police forces. The coal and iron police used deadly force, wounding nine, in a confrontation with strikers in Shenandoah, Pennsylvania, in 1887.

Soldiers represented the last line of employer defense. Governors willingly dispatched their militia or National

Guard to strike scenes. Both the state militia and federal troops helped break the PULLMAN STRIKE of 1894. In 1896 mine operators in Leadville, Colorado, broke a strike by insisting that strikebreakers be enlisted in the Colorado National Guard and be issued weapons to defend themselves and company property.

In fact, strikers often vented their frustration against strikebreakers and company property. During the Leadville Strike, for example, a group of strikers attacked the Coronado mine and dynamited its oil storage tank. Strikers reserved most of their rage for strikebreakers, whom they denounced as scabs and blacklegs. Strikebreakers were stoned and beaten, and many were killed. Strikers justified this violence by arguing that strikebreakers were taking their jobs. The strikers believed that in going out on strike they were not quitting their jobs but, rather, they were temporarily withdrawing from work to better their pay or working conditions.

Racism also ignited labor violence. On September 2, 1885, a group of white coal miners attacked Chinese workers in Rock Springs, Wyoming, killing 28 and wounding 15 more. This massacre was rooted in racial prejudice, since it exacerbated the fear that the Chinese miners would keep wages low and sharpened the memory that 10 years earlier the Chinese had broken a strike.

## labor, woman

The number of women working outside the home dramatically increased between 1870 and 1900. Textile factories were among the largest employers of females, but women also found work in the expanding food-preparation, garment, and shoe industries, among others. More respectable nonmanufacturing employment opportunities also increased. The introduction of the typewriter created more than 400,000 office jobs for women. The number of females in retail sales increased nearly 20 times (from 7,462 to 142,265) between 1880 and 1900. Young single females filled most of the jobs, but after 1880 an increasing number of women either entered or remained in the labor market after marriage.

Several factors explain the trend of married women working for an income. One was the increase of jobs in retail clerking, office work, and COMMUNICATIONS (telegraph and telephone) that appealed to middle-class women. But economic necessity was the primary motive. Most working-class and lower middle-class families could not subsist

on one income. The declining birth rate, particularly in nonimmigrant families, left fewer children to provide that income while freeing women from years of child-rearing responsibilities.

The working woman's contribution to her family's income was not substantial, since women suffered from wage discrimination. In 1900 male factory workers' average earnings were 75 percent more than those paid to women. The so-called respectable occupations paid even less; a female factory worker could earn two to three times as much as a retail clerk. Low wages tempted many into the nation's flourishing sex industry. In 1894 the Chicago Vice Commission investigation found that a prostitute could earn at least four times as much as a woman working in a factory.

Women attempted to improve their conditions by joining labor unions. Perhaps the best-known female trade union was the Daughters of Saint Crispin (shoemakers), founded in 1871, which conducted several successful strikes. But most trade unions ignored women. Male shoemakers, for example, belonged to the Knights of Saint Crispin. The KNIGHTS OF LABOR (Knights), however, encouraged female membership. More than 200 local assemblies were exclusively female, with the largest one, located in Cincinnati, having at least 1,000 members. Many local assemblies were gender diversified. In 1887 the Knights hired Leonora Marie Barry as its general instructor and director of women's work. Barry's investigation of working conditions of women helped shape the Pennsylvania Factory Inspection Act of 1899.

Middle-class reform groups also took an interest in improving the conditions for working women. Many reformers desired to protect them from evil influences that might tempt them into prostitution, but several addressed economic needs. The Working Women's Protective Union of New York, for example, collected unpaid wages for thousands of cheated women. Reform societies also lent their support to the passage of a variety of laws that limited the hours per week a woman could work and setting sanitation standards. But the laws were rarely enforced strictly.

## labor organizations

During the last third of the 19th century, labor organizations fell into two categories: trade unions focusing on job-related issues and reform unions seeking basic social change. Most trade unions recruited members from a single craft, such as iron molders, machinists, or carpenters. A

small number organized on an industrial basis, admitting all those working in a particular industry.

Proponents of both trade and reform unions agreed on the eight-hour day. As early as 1866, representatives of trade unions, eight-hour leagues, and other reform groups founded the National Labor Union (NLU). Although it spearheaded an organizational drive that established several national trade unions, the NLU sought a better world based upon cooperatives, and it embraced the idea of a cheap currency to finance those cooperatives. In 1872 the NLU transformed itself into the Labor Reform Party, causing it to lose the support of many trade unionists. A disaster at the polls and the onslaught of the depression of 1873 caused the NLU to disintegrate. Federated into decentralized national organizations, nearly three-fourths of the trade unions existing in 1870 did not survive the economic depression of 1873–79.

The KNIGHTS OF LABOR (Knights) inherited the NLU's reform mantle. Although founded in 1869, the Knights did not become a significant organization until its membership vastly expanded as a result of the GREAT STRIKE OF 1877. It, like the NLU, envisioned the wage system being replaced by a cooperative society, and it emphasized arbitration rather than strikes. The Knights, as an inclusive union, organized all "productive people" into local assemblies that were grouped into larger district assemblies. Its general assembly and grand master workman (president) provided direction at the national level.

The disastrous 1873–79 depression forced trade-union leaders to rethink their organizational plans. One of the influential leaders of this "new unionism" was SAMUEL GOMPERS of the cigar makers. Drawing on his experience in the British trade union movement, Gompers centralized control at the national level and charged high dues to build a reserve fund and a strike fund and to cover operating expenses. Many unions also provided their members with life insurance plans, disability insurance programs, or both.

But the primary purpose of the trade union was the improvement of wages and working conditions through collective bargaining supported by the strike and boycott. The strategy required each union to exclusively control its segment, be it craft or industry, of the labor market or jurisdiction. As a result "dual unionism" (two or more unions operating in the same occupational niche) was denounced as an abomination while unions also attempted to expand their jurisdictions.

Resolution of jurisdictional disputes, combined with the need to present a united front on political issues, required a coordinating body. Citywide federations of labor unions first appeared in the 1830s, but to centralize power a national organization was necessary. In November 1881 more than 100 delegates meeting in Pittsburgh created the

Federation of Organized Trade and Labor Unions of the United States and Canada (FOOTALU). The new federation was not a success; only 19 delegates attended its second convention. In an effort to revive its fortunes, FOOTALU resurrected agitation for an eight-hour day and called for a general strike on May 1, 1886, if the shorter day had not been achieved. That call resulted in the tragic HAYMARKET RIOT and failed to resuscitate the FOOTALU.

It was possible for a worker to belong to both the Knights and a trade union without an apparent conflict of interest as long as the local assembly of the Knights drew its membership from a number of occupations. But when local assemblies represented members of only one craft, they became a dual union. Soon craft assemblies and trade-union locals began raiding each other for members. The raids led to the dissolution of the weak FOOTALU and the formation of the AMERICAN FEDERATION OF LABOR (AFL) in 1886. The AFL then demanded that the Knights refuse membership to anyone working in the jurisdiction of an established trade union.

The Knights refused and ordered its single-craft locals to withdraw from their district assembly and join one of the 22 newly formed national trade assemblies. Open warfare soon broke out, with AFL unions and the Knights supplying workers to break the strikes of the other's organization. But the Knights were ill-prepared to fight such a war; its leadership was philosophically opposed to strikes, and the creation of national trade assemblies caused many trade unionists, especially those in mixed assemblies, to leave the order.

The AFL's defeat of the Knights enabled "pure and simple unionism" to prevail among labor organizations by 1900. It was pure because only working people were permitted to join and simple because it focused on economic issues, but since virtually all its members were skilled craftsmen, it was also exclusive and elitist.

## labor trends

Four major trends—loss of control over the workplace, labor conflict, rapid geographic mobility, and increasing diversity—shaped the development of American labor during the last third of the 19th century. In 1870 skilled artisans

working in small shops in which they exerted a great deal of control over the productive process dominated the American industrial landscape. But the reduction of skills, already well underway, combined with mechanization to transform the shops into large impersonal factories. Diminution of skills began with the subdivision of a process into minute tasks and assigning one person to each task. At some point the reduction procedure suggested a mechanical means of replacing or supplementing human effort. The machines, mostly driven by steam, but increasingly by electricity from the late 1880s, were grouped into large factories. By 1899 two-fifths of the 512,191 industrial establishments in the United States were factories.

Mechanization dramatically increased per capita productivity; the average worker in the 1890s produced twice as much as his or her counterpart in the 1860s. But the worker lost control over the job in the factory. The machine, not the employee, set the pace of work. Deprived of the knowledge of how the productive process worked, the unskilled worker became dependent upon instructions from management. It became apparent that just as machines could be redesigned to increase efficiency, so could the worker. Frederick W. Taylor, the father of "modern management," began his scientific analysis of work behavior at the Midvale Steel Company during the 1880s. Through his and the efforts of others, the term *human engineering*, with all its questionable implications, came into vogue.

As laborers became viewed as cogs in a machine they lost their ability to determine their income. The diminution of skills rendered apprenticeship obsolete. But apprenticeship was more than an educational system that taught the novice the mysteries of a craft: It was the gate used by artisans to control entry into the job market. Moreover, workers had only their time to sell as demand for their skills declined. Without any real bargaining power in a highly competitive market, the individual worker was at the mercy of the employer.

Workers joined unions to improve their bargaining power and used the strike to enforce their demands. The number of strikes per year, of course, varied, but the pronounced trend in the Gilded Age was toward more strikes involving more people and lasting a longer period of time. There were twice as many strikes in 1895 as in 1893. In 1896 a total of 183,813 workers went on strike. Three years later, 308,267 strikers walked the picket line. Labor-management disputes often degenerated into armed conflict, as in the HOMESTEAD STRIKE. Reprisals followed strikes as employers blacklisted or identified strike leaders as unsuitable employees, forcing many to leave their communities.

Geographic mobility rates soared as workers, suffering from unemployment or looking for better jobs, moved from town to town. Waltham, Massachusetts, and Hazleton,

Pennsylvania, illustrate the rapid population changes that most American communities experienced during the era: Only 17 percent of adult males living in Waltham in 1870 resided in that city in 1890. Less than half the people residing in Hazleton, Pennsylvania, in 1884 were living there in 1890. The out-migration in both cities did not indicate a population loss. Waltham's population increased from 9,065 to 11,512 between 1870 and 1890, while Hazleton's population doubled between 1880 and 1890.

IMMIGRATION fueled a large part of the population growth. More than 9 million people immigrated to the United States between 1870 and 1890. The ethnic composition of the immigrants also changed. Prior to 1870 most immigrants were from northern Europe. After 1870, however, people from eastern and southern Europe began to arrive in increasing numbers. Only 55,759 Italians came to America during the 1870s, for example, but 651,893 made the trip between 1891 and 1900.

American workers feared the "new immigrants" as cheap labor and potential strike breakers. Trade unions, dismissing them as unorganizable, sought to restrict immigration or drive them out of their job jurisdictions. In 1897 the United Mine Workers of America lobbied successfully for a law (later declared unconstitutional) that taxed anthracite coal mine operators for every alien they hired. Ethnic prejudice against Slavic, Jewish, and Italian immigrants helped taint all industrial workers as inferior and, perhaps, un-American. Racism also victimized AFRICAN-AMERICAN industrial workers. Women who were entering the workforce in increasing numbers also suffered wage discrimination.

—Harold W. Aurand

**La Farge, John Frederick Lewis Joseph** (1835–1910)  
*artist, writer*

A versatile artist and facile writer, John La Farge was born in New York City on March 31, 1835. His parents were born in France. His father, a successful businessman, had invested wisely in real estate, and his mother, the daughter of émigrés, came from a distinguished Parisian family. In his bilingual home La Farge grew up looking at paintings and reading books ranging from Homer to Voltaire. Since he loved to draw and paint, his mother's father, Louis Binsse de Saint-Victor, a fine miniaturist, gave him lessons. La Farge attended the grammar school connected with Columbia University, entered St. John's College (now part of Fordham University), and graduated in 1853 from St. Mary's College in Emmitsburg, Maryland. Following his

father's wish, La Farge studied law from 1853 to 1856, but he could not overcome his doubts about pursuing a law career.

A trip with his brothers to Paris, to meet their Saint-Victor relations, enabled La Farge, with his father's blessing, to explore and develop his interest in art and literature. Through his mother's cousin Paul, a distinguished critic, La Farge visited literary salons and painters' ateliers and studied briefly in the studio of Thomas Couture. Recognizing a unique talent, Couture befriended La Farge and advised him to study and copy drawings in the Louvre. He followed that congenial advice and traveled widely in northern Europe copying drawings and paintings, until he was called home in fall 1857 by his father's serious illness. La Farge resumed studying law until his father died and left him enough money to study art. He went to Newport, Rhode Island, to work with William Morris Hunt, a Couture student, and fell in love with Margaret Mason Perry, the granddaughter of the naval hero Oliver Hazard Perry. La Farge and Perry married on October 15, 1860, and had 10 children, seven of whom lived to be adults.

La Farge's study with Hunt was short lived. Hunt had moved from Couture's realistic figure painting to genre scenes bathed in natural light, characteristic of the Barbizon school, which La Farge did not appreciate. Pursuing an independent course, La Farge taught himself through trial and error and achieved some success. He was fascinated by the interplay of light and color, studied the science of optics, and utilized it in his major landscapes *Paradise Valley (New England Pasture Land)* (1866–68) and *The Last Valley—Paradise Rocks* (1867). Both of these paintings were exhibited widely, received critical acclaim, and enabled La Farge to support his growing family with the sale of modest-sized paintings. In the 1860s La Farge was also in demand as an illustrator, especially of poetry, in magazines and books. In visits to Boston and New York, he made many friends, including the Gilded Age's leading intellectuals: HENRY JAMES and WILLIAM JAMES, WILLIAM DEAN HOWELLS, HENRY ADAMS, CLARENCE KING, and JOHN MILTON HAY.

Architect HENRY HOBSON RICHARDSON asked La Farge in 1875 to decorate the interior of his masterpiece, Boston's Trinity Church. The request changed La Farge's life. His murals accomplished by a crew working under his direction, were so successful that La Farge abandoned easel painting for a new career as a decorative artist. Leaving his wife and family in Newport, he moved his headquarters to New York City and decorated mansions, public buildings, and churches. Besides Boston's Trinity Church, his decorative masterpieces include the 1904 Supreme Court room in the Minnesota State Capitol (especially Moses on Mount Sinai) and his greatest mural, in New York's Church of the Ascension.

Decorating churches heightened La Farge's interest in stained glass, which dated from his first visit to France and was reinforced by an 1873 visit to England, where he saw pre-Raphaelite stained-glass windows. Despite poor health, aggravated by lead poisoning in the pigments he used, La Farge kept experimenting and in 1879 hit on opalescent glass, which he patented in 1880. La Farge subsequently made thousands of stained-glass windows for churches and private homes.

Despite his commissions, La Farge lost money, especially in stained glass. A perfectionist, he kept on experimenting. After going bankrupt in 1883, he took on partners, with whom he fell out. Even though he was exonerated when they charged him with grand larceny, his reputation suffered and commissions fell off. Rather than La Farge, LOUIS COMFORT TIFFANY scored the big commercial success from his development of opalescent glass.

His commercial shortcomings enabled La Farge to travel and write. In 1886, at the invitation of Henry Adams, La Farge accompanied him to Japan and in 1890 to 1891 to the South Sea islands. In almost 300 watercolors and in *An Artist's Letters from Japan* (1897) and *Reminiscences of the South Seas* (1912), La Farge captured exotic scenes vividly and eloquently. He was also a gifted lecturer on art at both the Metropolitan Museum in New York (1893) and the Art Institute of Chicago (1903). His lectures were published as *Considerations on Painting* (1895) and *The Higher Life in Art* (1908). At the end of his life, his creditors took his estate for debts. His wife, who cared for him until she had to put him in a mental hospital, used her own funds to pay off his other debts. La Farge died on November 14, 1910, in Providence, Rhode Island.

Barbara Weinberg, *The Decorative Work of John La Farge* (New York: Garland Press, 1977); James L. Yarnall, *John La Farge: Watercolors and Drawings* (Yonkers, N.Y.: Hudson River Museum of Westchester, 1991); James L. Yarnall, *Recreation and Idleness: The Pacific Travels of John La Farge* (New York: Vance Jordan Fine Art, 1998).

**Langston, John Mercer** (1829–1897) *activist, educator, lawyer*

John Mercer Langston was born on December 14, 1829, in Louisa County, Virginia, the son of Ralph Quarles, a white planter, and Lucy Langston, his freed slave. After his parents died in 1834, Langston was raised by a white couple in Ohio and in 1844 entered the preparatory department at Oberlin College, an antislavery hotbed. There he became active in the antislavery cause, receiving his bachelor's degree in 1849 and in 1853 a graduate degree in theology.

Langston did not enter the ministry (largely because the churches had failed to oppose slavery), choosing instead to read law under the tutelage of Philemon Bliss, and in 1854 he was admitted to the Ohio bar.

Langston in 1854 also helped establish the Republican Party in the Western Reserve in northeastern Ohio and married Caroline Matilda Wall, whom he had met at Oberlin. The following year he was elected town clerk in Brownhelm, Ohio, becoming the first of his race elected to office in the United States by popular vote. Technically, Langston was considered "white" because Ohio's law considered those with at least 51 percent Caucasian "blood" to be white. Langston, however, choosing to be black, optimistically wrote to Frederick Douglass that his victory "argues the steady march of the antislavery sentiment, and augurs the inevitable destruction and annihilation of American prejudice against colored men." Langston added that more black voters were needed to have political influence, for it represented "the bridle by which we can check and guide to our advantage the selfishness of American demagogues."

Langston was a militant reformer. He helped maintain Ohio's Underground Railroad for runaway slaves and in 1858 defied the Fugitive Slave Act of 1850 by participating in the rescue of John Price. In 1858 he organized and served as president of the all-black Ohio State Anti-Slavery Society. Langston also protested discrimination at home. Although Ohio's racist "black laws" had been repealed in 1848–49, AFRICAN AMERICANS still could not vote and did not have the "bridle" Langston knew they needed. Like many of his abolitionist contemporaries, Langston was an advocate of WOMEN'S RIGHTS and temperance. During the early 1850s he supported emigration and black separatism, but he changed his view after attending the 1854 Cleveland Emigration Convention and devoted his life to a vigorous defense of integration. Langston conspired with John Brown but did not participate in the latter's ill-fated 1859 raid on the federal arsenal at Harpers Ferry to arm slaves in Virginia.

Langston saw the Civil War and its aftermath as an opportunity to destroy American slavery and achieve equality for African Americans. He was a chief recruiter in the West for the Union during the war years, and from 1864 to 1868 he served as president of the all-black Equal Rights League. The Reconstruction period was both a time of opportunity and of peril for former slaves. As an inspector for the Freedmen's Bureau, Langston toured the South in 1867, urging the freedmen and women to seek education, political equality, and economic justice. In Washington, D.C., he organized Howard University's law department in 1869, and from 1873 to 1875 he served as that institution's acting president, only to resign in disappointment when he was not named its permanent president.

Langston was a leading Republican spokesman for African Americans and served that party in various capacities. As the legal officer of the District of Columbia's Board of Health (1871–77), he drew up Washington's sanitation code. He also helped Senator Charles Sumner draft the CIVIL RIGHTS ACT (1875). From 1877 to 1885 he was consul general and resident minister to Haiti. Upon returning to the United States in 1885, Langston assumed the presidency of Virginia Normal and Collegiate Institute at Petersburg, but within two years Democratic pressure forced him to resign. Langston turned to politics and decided to represent Virginia's mostly black Fourth Congressional District, but General William Mahone, a former Confederate general and Republican leader, opposed having a black man in CONGRESS. Langston ran as an independent and won a bitterly fought campaign in 1888, but the results were contested. Langston was finally admitted to Congress in 1890 but was defeated in his bid that year for reelection, serving out his "lame duck" session until March 1891.

Langston then returned to Washington where he practiced law. In 1894 he published his autobiography, *From the Virginia Plantation to the National Capitol*. When Langston died in Washington on November 15, 1897, he had—despite the current rampant disfranchisement and segregation—faith that "in the courts, by the law" African Americans would achieve the equality that was their right as citizens.

**Lazarus, Emma** (1849–1887) *poet*

The daughter of Moses Lazarus, a wealthy sugar merchant, and Esther Nathan Lazarus, Emma Lazarus was best known for her poem celebrating America as a refuge for the oppressed. She was born in New York City on July 22, 1849, where she grew up in a cultured upper-class house-

hold. Her family descended from one of the oldest Jewish families in New York City and belonged to a Sephardic aristocracy that moved easily in wealthy Christian circles; her father joined the Vanderbilts and Astors in founding the elite Knickerbocker Club and built a fashionable summer house in Newport, Rhode Island. She received a sound classical education at home and was proficient in French, German, and all the attainments of her class.

Lazarus was devoted to literature from her childhood and began to write poetry in her early teens. Her proud father published her first collection, *Poems and Translations Written between the Ages of Fourteen and Sixteen*, in 1866, and she sent a copy of it to Ralph Waldo Emerson in 1868. Although her youthful efforts were strained and imitative, the Sage of Concord responded warmly and entered into a long-standing correspondence with her. When her second volume was commercially published in 1871, it met with excellent reviews in both the United States and England, and her 1874 novel based on the life of Goethe won praise from the eminent Russian author Turgenev. She was later to receive encouragement from such literary notables as the naturalist John Burroughs and the novelist HENRY JAMES, and during her 1883 visit to Europe she became a friend of William Morris and Robert Browning.

Lazarus, like her family, had never been observant of religious laws or rites, although in her writing she had occasionally drawn on her Judaic heritage. In her early 30s, however, she became increasingly aware of the persecution of Jews in czarist Russia and the flood of Jewish immigrants to the United States. Turning from classical topics and Teutonic legends for themes, she began to write both poetry and essays in support of her people. As anti-Semitism spread through eastern Europe, she became a spokesperson for the Jewish community, protesting its mistreatment both at home and abroad. In a series of articles entitled "An Epistle to the Hebrews" that appeared in 1882–83 in *American Hebrew*, she called on American Jews to recognize their rights, and in 1882 she published a collection of poetry entirely devoted to Jewish themes, *Songs of a Semite*.

Writing was not her only contribution to the cause. She worked actively for the Hebrew Immigration Aid Society, helped establish the Hebrew Technical Institute for Vocational Training, and in 1883 founded the Society for the Improvement and Colonization of East European Jews, calling for the establishment of a Jewish homeland in Palestine 13 years before the term *Zionism* came into use.

In 1882 Lazarus wrote the sonnet "The New Colossus" for an auction in support of the Bartholdi Pedestal Fund. Contrasting the welcoming female figure of *Liberty Enlightening the World* with the militaristic sculpture of antiquity, the poem presents America as a nurturing force, "Mother of Exiles," and helped define America's image as a haven for the oppressed in that period of open IMMIGRATION. Her

best-known work, it was engraved on a plaque on the base of the STATUE OF LIBERTY in 1903. Lazarus died in New York City on November 19, 1887.

**Lease, Mary Elizabeth Clyens** (1850–1933)  
*reformer, orator*

Mary Elizabeth Clyens was born in Ridgeway, Pennsylvania, on September 11, 1850, to Irish immigrant parents. Her father, two brothers, and an uncle died in the Civil War, leaving the family impoverished. Friends sent her to St. Elizabeth's Academy in Allegany, New York, from which she graduated in 1868. She taught in McKean County, Pennsylvania, schools until 1870 when, having failed to unionize fellow teachers, she took a position in a Catholic girls school in Osage Mission, Kansas. In 1873 she abandoned Catholicism and married Charles L. Lease, a local druggist. Together they farmed in Kansas and Texas for 10 lonely, dreary, unsuccessful years and then settled in Wichita, Kansas, where Charles Lease resumed his career as a druggist and, to make ends meet, Mary Elizabeth—while raising four children—took in washing. The following year, in 1884, Lease, who was very bright, began studying law at home and later claimed she was admitted to the Kansas bar in 1885.

Lease was committed to egalitarian reforms and organized a women's group, the Hypatica Society, to discuss issues. She was a gifted orator with a gorgeous, moving, contralto voice, and in 1885 she began her public-speaking career by raising funds for the Irish National League and later that year advocated woman suffrage in an address to the Union Labor Party state convention. That party, a remnant of the GREENBACK-LABOR PARTY, was supported by debt-ridden Kansas farmers with whom Lease identified. By 1888 she not only spoke widely for the Union Labor Party but also edited the *Union Labor Press*. Lease joined the KNIGHTS OF LABOR and in 1891 was elected master workman (president) of a large local assembly in Kansas. By 1890 she had also stumped Kansas for the FARMERS' ALLIANCES. She spoke extemporaneously; was vehement, charismatic, prone to exaggerate; and often could not recall precisely what she said. Although renowned for telling farmers to "raise less corn and more hell," she denied having said those words, but in that spirit she aroused farmers by heaping invective upon RAILROADS, bankers, and landlords.

Although a political force, Lease was more an agitator than a politician. She seconded the nomination of James B. Weaver for president at the 1892 PEOPLE'S PARTY (Populist) convention and joined him in his campaign in the West

and South. Hostile Democrats, however, made the tour of the South unsuccessful and heightened her hatred (originating during the Civil War) of that party. The Populists secured the governorship of Kansas in 1893, and Lease was appointed president of the State Board of Charities. In that same year she opposed, without success, the fusion of Populists and Democrats in the legislature. The governor, who was a fusionist, removed her in 1894 when she refused to appoint Democrats and called him a corruptionist. She sued and triumphed in the state Supreme Court, but for 30 years she received no restitution from the state. A leading antifusionist Populist, Lease opposed to no avail the nomination of WILLIAM JENNINGS BRYAN at the 1896 Populist convention and actually supported WILLIAM MCKINLEY. When the *New York World* hired Lease to cover the Bryan campaign and then kept her on, she left Kansas (much to the delight of her former compatriots).

Prior to Lease's defection to the Republicans, she published *The Problem of Civilization Solved* (1895). It called for a strong leader who would promote IMPERIALISM and hemispheric free trade coupled with protection, socialism, and Free Silver (see FREE SILVER MOVEMENT), and enable the people to force the consideration and enactment of legislation, particularly the initiative and referendum. Settling in New York with her children, Lease divorced, embraced theosophy, and supported Theodore Roosevelt and progressive reforms, including woman suffrage, prohibition, and especially birth control. She died on October 29, 1933, at Callicoon, New York.

**Leslie, Frank** (1821–1880) *publisher, engraver* and  
**Leslie, Miriam Florence Follin** (1836–1914) *editor, publisher*

A pioneer of illustrative journalism and investigative reporting, Frank Leslie was born Henry Carter in Ipswich, England, on March 29, 1821. He learned wood engraving as a boy and when 21 worked for the *Illustrated London News*. The previous year he had married Sarah Ann Welham; they had three sons. Sensing greater opportunity in the United States, he immigrated to New York in 1848 and opened an engraving business under the name Frank Leslie, which had been his pseudonym.

By 1854 Leslie started *Frank Leslie's Ladies Gazette* and the next year launched his best-known and longest-lived publication, *Frank Leslie's Illustrated Newspaper* (1855–1922). Picturing the latest news, this weekly was a journalistic breakthrough. It also anticipated muckraking, when in 1858 it campaigned, with graphic illustrations, against “swill milk” (obtained from sickly cows housed in factory buildings and fed refuse grain from local breweries), provoking the state legislature to act. Growing tensions between the North and South and the ensuing Civil War (1861–65) increased sales of the *Illustrated Newspaper* with its woodcuts based on artists’ battlefield drawings, as words could not express what illustrations conveyed, such as the difficulty loading a 15-inch cannon inside the turret of a monitor during the 1863 attack on Fort Sumter. The prosperous Leslie expanded his illustrated publications to include children’s and women’s magazines, almanacs, classics, and lavish works, using his archives, on the Civil War and Abraham Lincoln.

Leslie’s personal life, however, was unhappy. In 1860 he left his family for rooms at the home of Ephraim George Squire, a promoter of Honduran railroad schemes and an archaeologist who contributed to Leslie publications and was married to the beautiful and talented Miriam Florence Follin, with whom Leslie was infatuated. Miriam was born in New Orleans on June 5, 1836, and around 1850 had moved to New York, where her mother kept a boardinghouse. A good student, she excelled in French, Spanish, and German. When she was seduced in 1854, her mother insisted that Miriam marry, but she never lived with the man, and the marriage was annulled two years later. From 1856 to 1857 Miriam toured as “Minnie Montez,” the sister of the celebrated actress Lola Montez, with whom Miriam’s half brother, who died in 1856, had been in love. In March 1857 Lola and “Minnie” appeared in *Frank Leslie's Illustrated Newspaper*. By April of that year Miriam became the mistress of former congressman William M. Churchwell of Tennessee, and six months later she married Squire, who always called her Minnie.

The year after moving in with them, Leslie made Squire editor of *Frank Leslie's Illustrated Newspaper* (1861) and two years later made Miriam editor of *Frank Leslie's Lady's Magazine*. Proving an excellent editor, Miriam began *Frank Leslie's Chimney Corner* in 1865 and six years later became editor of the fashion magazine, *Frank Leslie's Lady's Journal*. By then Miriam and Leslie were lovers. He obtained a divorce in 1872, and she, in 1873; they married in New York on July 13, 1874. Miriam had no children. Together they pursued a lavish lifestyle that was short-lived. The depression following the panic of 1873 cut publishing revenues and plunged Leslie into bankruptcy, and a tumor in his throat ended his life on January 10, 1880.

Illustration of President James A. Garfield after his attempted assassination appearing in *Frank Leslie's Illustrated Weekly*, July 23, 1881 (Library of Congress)

By his will, which was unsuccessfully contested by his sons, Leslie placed in Miriam’s capable hands his publishing empire, with its \$300,000 in liabilities. Using her jewelry as security, she borrowed \$50,000 from a sympathetic woman to pay the most pressing debts. She legally changed her name to Frank Leslie, began eliminating journals (by 1885 she was down to six profitable publications), and personally economized. But it was her brilliant newspaper instincts that turned the enterprise around. In 1881 she was responsible for the swift coverage of JAMES ABRAHAM GARFIELD’s assassination and of his death a few months later, scoops that spiked circulation from 30,000 to 200,000 and enabled her to pay off the \$50,000 loan. A feminist, she believed that women were inherently better news gatherers than men and often employed women interviewers. Her beauty

and her charm (she was only 43 when Leslie died) were assets, but her outstanding editing and managing ability helped more. Her phenomenal success led to her renown as the “Empress of Journalism.”

With an annual income of \$100,000, Miriam resumed a comfortable lifestyle. She traveled abroad each summer, where she became enamored with titled people. She admired Lady Jane Wilde, tried in New York to emulate her London salon, and suggested that Wilde’s son Oscar lecture in America, giving him lavish press praise when he did. In 1891 she married Oscar’s indolent older brother, William C. Kingsbury Wilde, and divorced him two years later. Before marrying Wilde, she had other younger male escorts, who admired her bank account as well as her beauty. She was engaged briefly to a foppish French marquis, who turned out to be the son of a London hatter. His rival was a handsome Russian prince, who had spent seven years in jail for forgery.

Miriam’s prowess as an editor and publisher and her flamboyant loves intrigued the public. Dripping with diamonds and hinting that the Prince of Wales had flirted with her, she toured the country, lecturing on the “Royal Leaders of Society.” A facile writer, she syndicated newspaper articles on subjects like “Kissing as a Fine Art,” and as she sold off journals, she wrote books such as *Beautiful Women of Twelve Epochs* (1890) and *Are Men Gay Deceivers?* (1893). By 1905 she was totally out of the publishing business. Miriam died on September 18, 1914, leaving her \$2 million estate to woman suffrage.

### Liberal Republican Party (1872)

Ulysses S. Grant, the taciturn Civil War hero, unified the various elements in the Republican Party and triumphed in the 1868 presidential campaign. Since his views were unknown, spoils politicians, patrician reformers, merchants, manufacturers, and farmers—all with their differing interests—could hope and even surmise that he would be sympathetic to issues close to their hearts. Perhaps no group surmised more optimistically than the liberal reformers who had embraced a cluster of beliefs, including CIVIL SERVICE REFORM, free trade, the gold standard, reconciliation with the South, and anti-IMPERIALISM. Their ideal was a laissez-faire government staffed by experts, rather than political operatives, and headed by a first-rate administrator and leader who could achieve their goals. Grant, who as a general had picked able subordinates, seemed to liberal reformers to be superbly equipped for the presidency.

Grant, however, disappointed reformers. His cabinet included some reformers but also some spoils politicians, some cronies, and some wealthy men who had entertained Grant. Disappointment turned to disillusionment when his appointments to office favored the candidates of party leaders in the Senate and House, who almost invariably strengthened their political organizations and slighted the cultivated gentlemen of distinguished families who belonged to the reform wing of the party. Grant proved to be a passive leader and a weak administrator who neither dominated his cabinet nor led CONGRESS.

Worse, when he did become involved, he either was duped into supporting a scheme to corner the gold market or became obsessed with the idea of annexing Santo Domingo. For his part, Grant was not only infuriated by the reform opposition to annexation but also by the willingness of liberal reformers, despite increasing violence against blacks in the South, to ally themselves with ex-Confederates and overthrow regular Republicans in border states like Missouri. By 1871 Grant—appreciating party regularity more than independence—eliminated liberal reformers from his cabinet and their sympathizers from the civil service, allied himself with Senate spoilsmen like ROSCOE CONKLING and called for tough Ku Klux Klan legislation to protect southern black Republicans.

The Liberal Republicans—strongly supported by major urban newspapers and the intelligentsia, but also joined by a number of disgruntled spoils politicians whom Grant had ignored and alienated—moved to form their own party and to nominate a candidate acceptable to the Democrats for 1872. Meeting in Cincinnati, the Liberal Republican convention, with CARL SCHURZ presiding, endorsed civil service reform and attempted to attract white southerners and Democrats by attacking Radical Reconstruction, but did not take a strong stand on the TARIFF ISSUE.

Schurz and other reformers, along with their newspaper allies, had expected to nominate Charles Francis Adams, the son and grandson of presidents and the distinguished minister to England during the Civil War, but to their dismay the convention was stampeded into nominating Horace Greeley, editor of the *New York Tribune*. That nomination was ludicrous, since Greeley was hostile to civil service reform, favored a protective tariff, and was easily lampooned as the advocate of a variety of reforms, causes, and fads, ranging from abolition and utopian socialism to spiritualism and vegetarianism. Rather than support Greeley, some liberal reformers voted for Grant, others supported neither, while still others like Schurz, after much anguish, campaigned for Greeley. The Democrats “swallowed” Greeley, whom for decades they had despised, but many of them stayed home on election day. Greeley broke with tradition and spoke effectively as he campaigned vigorously, but his words could not dispel the unmerciful

caricatures of THOMAS NAST in *Harper's Weekly*. Grant decisively defeated Greeley who, brokenhearted by that loss and the recent death of his wife, died within a month of the election. With its members divided and demoralized, the Liberal Republican Party evaporated.

### Liberia, immigration to

In the 1820s Liberia began as a colony of the American Colonization Society, a private organization composed of whites who believed that the black race's destiny was in Africa, not in the United States. Liberia became a republic in 1847 and ranked with Haiti and Ethiopia as the world's only independent black-ruled nations. The existence of Liberia provoked a heated debate among AFRICAN AMERICANS prior to the Civil War. Emigrationists advocated a return to Africa, where they hoped to have a life free of racism and discrimination. In contrast, anti-emigrationists believed that it was their duty to remain and fight not only for greater inclusion in American life but also to eradicate slavery. Before 1860, the majority of immigrants to Liberia were slaves who were freed on the condition that they leave the country. During the Civil War, Edward W. Blyden, who emigrated years earlier from the Danish West Indies to Liberia, visited the United States and encouraged immigration to that land. But interest in emigration waned during the war and its aftermath, as many hoped that emancipation would lead to the attainment of civil and political rights.

Those hopes, however, ebbed as Radical Reconstruction gradually ended and white supremacists gained control of the South. The desire to emigrate to Africa was spurred by intimidation and atrocities perpetrated against former slaves by southerners determined to deprive blacks of the civil and political rights acquired during Reconstruction. The Liberian Exodus Joint Stock Steamship Company was organized in 1877 by Martin Delany and others in Charleston, South Carolina, but its ship—captained by an incompetent white—made only one voyage and in 1878 was seized for the payment of debts.

Interest in African emigration increased during the 1890s because of the proliferation of JIM CROW LAWS and the denial of the vote to African Americans. HENRY MCNEAL TURNER, a bishop in the African Methodist Episcopal (AME) Church, championed a back-to-Africa movement. He argued that Africa and specifically Liberia was the home of the American black and that life there would restore the dignity of African Americans. He viewed Amer-

ican democracy as hypocrisy and even considered the U.S. Constitution "a dirty rag, a cheat, a libel" that "ought to be spit upon by every Negro in the land." Turner believed that a limited emigration of 5,000–10,000 persons a year was feasible, and his visit to Africa in 1891 on behalf of the AME Church resulted in a series of glowing, optimistic reports on Africa's potential for immediate development by American blacks. While Turner persuaded many, his scheme was widely criticized by blacks such as BENJAMIN TUCKER TANNER. When Turner issued a call in November 1893 for a national convention to meet in Cincinnati to discuss repatriation outside of the United States, the majority of the delegates opposed emigration.

Despite the rosy views, migrants faced difficulties in getting to, and prospering in, Africa. Transportation was costly (approximately \$100 per passenger), and schemes to provide it cheaply were often abortive, ill planned, and fraudulent. In 1890 Democratic senator Matthew Butler of South Carolina proposed a bill to provide free transportation for all blacks who departed the South to become citizens of another country. Although the bill had support among southern conservatives it never had any chance of passing CONGRESS. The all-black Afro-American Steamship and Mercantile Company was formed in 1893 to operate steamship service to Liberia, but it was soon dissolved, since few blacks were either able or willing to purchase \$10 shares. Investors were reluctant because hustlers constantly cheated trusting African Americans into buying bogus tickets to Liberia for three dollars or some other ridiculously low price. In Arkansas, ignorant but hopeful emigrants gave thousands of dollars to two anonymous preachers who put 410 individuals on a train to Brunswick, Georgia, to meet a nonexistent ship. In 1895 would-be emigrants to Liberia were stranded in Florida waiting for free transportation. In Louisiana, defrauded persons were promised transportation to Africa for one dollar. In 1894 four whites formed the International Migration Society to capitalize on black southern interest in Liberia. Potential emigrants would pay a one-dollar membership fee and one dollar monthly until they contributed \$40 to pay for steamship passage and provisions. Most of the Society's income came from forfeited payments, but it did at least transport some passengers to Liberia.

Even after successfully securing transportation to Liberia, there was no guarantee that settlers could expect success as pioneers. Charles H. J. Taylor, who was a U.S. diplomat in Liberia for four months, was so negative that he—with some exaggeration—suggested there ought to be a law imprisoning for 10 years anyone who encouraged immigration to the "black land of snakes, centipedes, fever, miasma, . . . ignorance, poverty, superstition and death." Taylor's bleak words seem appropriate for the shipload of passengers that arrived in Monrovia, Liberia, in 1895 under

the auspices of the International Migration Society. No one knew that they were coming, no provisions were available for them in Monrovia, and several died soon after their arrival. In addition, there was political unrest because the dominant “mulatto clique,” as the dark-skinned Edward W. Blyden termed it, was resented by “pure Negroes.” Indeed, Blyden, convinced that mulattoes were troublemaking “vipers” and realizing that they would be a part of any African-American migration, renounced his earlier stand and concluded that “no greater evil could befall Africa or the Negro . . . than an exodus of Negroes from the United States.”

A few other voyages to Liberia in the late 1890s repeated the failures of previous voyages. Many died from diseases or were quickly disillusioned by their pioneer experience. The International Migration Society folded in 1899 only to be followed in the 20th century by other back-to-Africa proposals, including Marcus Garvey’s Universal Negro Improvement Association’s aborted effort to repatriate African Americans to Liberia in the 1920s.

### libraries, public, growth of

In the late 19th century, urban public libraries developed into major repositories of scholarly books and learned journals and were at the core of the intellectual life of the nation. Apart from Harvard and Yale, universities did not possess libraries of note until the 20th century. Some of the greatest public libraries were in fact mixed enterprises based on private as well as public resources. The vast holdings of the Library of Congress, the national library of the United States, began with Thomas Jefferson’s books, and the New York Public Library—the greatest city library in the world—was established in 1895 by consolidating the private Astor and the Lenox Research Libraries, which although rather snobbish were open to the public, with the bequest of SAMUEL JONES TILDEN.

During the Gilded Age, the collection of research materials documenting developments in contemporary society was regarded as the responsibility of the public library and not the university. The public libraries of wealthy cities were urged to collect “everything” including “silly, and even immoral, publications” to enable future

historians to reproduce the life of the past. The earliest library aiming to fulfill that mission was the Boston Public Library, established in 1848 in part to provide that city with research facilities similar to New York’s Astor Library. It was freely open to all. Justin Winsor, the head of Boston Public Library from 1868 to 1877, urged the collection of newspapers, periodicals, pamphlets, local historical materials, and genealogical records. Public libraries in Cleveland, Philadelphia, Detroit, and St. Louis also expanded their general collections and added to their research holdings during the Gilded Age. The Chicago Public Library—established shortly after the disastrous fire of 1871 and headed by William F. Poole, an outstanding bibliographer—did not achieve his hope that it would become the immense Midwestern research center, but it did acquire some scholarly resources and in 1897 established a working arrangement with two private research libraries (the Newberry, specializing in the humanities, and the John Crerar, specializing in science and technology).

By 1900 several huge public library buildings had either been completed recently or were under construction. The new building of the Boston Public Library opened its doors in 1895. The new home for the Library of Congress, completed in 1897, was the largest and most expensive library building in the world. In 1897 the Chicago Public Library also moved into its new building, and the contract was signed for the construction for the great marble repository of the New York Public Library. The development of great library collections, accessible to all and housed in monumental temples, reflected the economic wealth, cultural aspirations, and democratic values of American society.

### literature

The last third of the 19th century saw the emergence of mass literature in America along with profound shifts in the style and content of serious writing. MAGAZINES were the principal purveyors of literature for the masses. At mid-century, most fiction and poetry appeared first in the leading magazines, but after the Civil War new magazines proliferated, increasing 10-fold by 1900 as new modes of distribution enabled them to reach a larger audience. Book

publication also expanded significantly, though prior to 1891 many titles were by foreign authors, largely because the absence of international copyright protection enabled American publishers to reprint cheap editions of foreign works without paying for the rights. The International Copyright Law of 1891 ended that practice and enlarged the market for American authors.

American popular literature during the middle and late years of the 19th century was rigidly gendered. Women, who took the greatest interest in literature, generally preferred sentimental romances full of melodramatic incidents and moral uplift, and book publishers and magazine editors catered to their tastes. Men usually preferred DIME NOVELS depicting the heroic (and often violent) activities of detective Nick Carter, frontiersman Buffalo Bill (WILLIAM FREDERICK CODY), and other adventurers.

In the realm of serious literature, most American fiction in the years between 1870 and 1900 conformed to one or another of three major paradigms: the genteel tradition, realism, and naturalism. The genteel tradition, which upheld the traditional values associated with VICTORIANISM, prevailed in the 1870s. During the 1880s realists launched a literary revolution with their controversial but authentic depictions of the people, places, and circumstances that genteel writers preferred to ignore. Realism, by focusing attention on the dilemmas and hardships of common Americans, prepared the way for the naturalism of the 1890s, with its emphasis on socioeconomic or biological determinism in the struggle for survival.

The genteel tradition was the literary standard during the second half of the 19th century; respectability was its hallmark. Originally, such writing was mostly by and for white Anglo-Saxon Protestants, especially those of the eastern establishment. It reflected their notions of art, propriety—even reality. Genteel culture was cosmopolitan and Anglophile (Victorian) in taste and Germanic (Idealist) in philosophy. Through quality magazines such as the *Century*, *North American Review*, *Harper's Monthly*, and *Atlantic Monthly*, elite literary preferences infiltrated the cultured elements of the middle class. Editors of those magazines—Richard Henry Stoddard, George Boker, RICHARD WATSON GILDER, Edmund Clarence Stedman, and Thomas Bailey Aldrich—were guardians of the genteel tradition and arbiters of literary taste. Indeed, Aldrich, as novelist, poet, and editor of the *Atlantic Monthly* from 1881 to 1890, was the acknowledged master of the genteel style and, for a time, the nation's most esteemed author. Thanks to Aldrich and other leading editors, American literature was no longer the exclusive domain of literary ladies and gentlemen of the eastern elite; it had become a profession. Readers came to expect literature that was well-crafted, traditional in form, high-minded in content, and full of highly selective, even idealized, depictions of real-

ity, whether the setting was American or, as it often was, international.

Even during the 1870s, however, the genteel tradition came under attack. It had grown formulaic, effete, and out of touch with a nation experiencing turbulent social, economic, and technological changes. This apparent indifference to contemporary issues merely masked anxieties about social and cultural pluralism. Try as they might to preserve the ideal of a unified culture, literary traditionalists could not hold back the tide. An emerging generation of writers and critics called for a new fiction, something distinctly American in style and content, a literature that would portray the nation in all its specificity and diversity. This critique of the genteel tradition heralded the rise of realism.

Although scholars have found realistic elements in the literature of the 1850s, realism did not become a vital force until the 1880s. American realism of the late 19th century was the product of philosophical materialism, the influence of French novelists Gustave Flaubert and Émile Zola, and the unwillingness of the genteel writers and editors to face the realities of American life. Unlike genteel writers, who idealized their subjects, realists valued objectivity. They tried to render "lifelike" or "factual" accounts of ordinary people in the varied circumstances and settings that constituted the new America. Rarely, if ever, had American writers been so responsive to social, political, and economic issues as during the last two decades of the 19th century. HELEN HUNT JACKSON depicted mistreatment of NATIVE AMERICANS. Albion W. Tourgee, George Washington Cable, and Charles W. Chesnutt, the first important African-American novelist, reconnoitered the racial divide. Tourgee and John W. DeForest explored sectional reconciliation in the aftermath of the Civil War. DeForest, HENRY ADAMS, Charles Dudley Warner, and MARK TWAIN (Samuel Langhorne Clemens) detailed the corrupt ways of politicians. Charlotte Perkins Gilman, Elizabeth Stuart Phelps, and Kate Chopin challenged conventional views of domesticity, while Mary Wilkins Freeman chronicled strong-willed women who faced adversity with courage and independence. JOHN HAY and Henry F. Keenan presented opposing perspectives on labor unrest. HAMLIN GARLAND and Harold Frederick chronicled "the ugliness, the drudgery, and the loneliness" of farm life on the Great Plains. Abraham Cahan wrote of the immigrant experience. WILLIAM DEAN HOWELLS delineated issues of class, especially the phenomenon of upward mobility in an age of new fortunes.

Howells was the pivotal figure in the realistic movement. Despite his strong ties to the major authors and editors of the genteel tradition, Howells used his prestige as editor of the *Atlantic Monthly* during the 1870s and columnist for *Harper's Monthly* during the 1880s to promote the new literary aesthetic. Howells's novels—*A Modern*

*Instance* (1882), *The Rise of Silas Lapham* (1885), and *A Hazard of New Fortunes* (1890)—bridged the genteel and realist traditions. As a leading critic he encouraged realists to democratize American literature by including characters of various classes, regions, occupations, and ethnic backgrounds. Above all, he advanced the careers of innovative and talented realists, including Twain, HENRY JAMES, and STEPHEN CRANE, who would remake American literature.

Twain emerged as the foremost practitioner of regional realism, which introduced readers to the distinctive natural environments, customs, folklore, and dialects of provincial America. SARAH ORNE JEWETT's Maine, George Washington Cable's New Orleans, Hamlin Garland's Middle Border, E. W. Howe's country town, Joel Chandler Harris's rural Georgia, and BRET HARTE's mining frontier are notable examples of regional realism. Twain's masterpiece, *The Adventures of Huckleberry Finn* (1884), drew on the author's experiences along the great Mississippi River. In Twain's hands, this seemingly innocuous genre, which was sometimes merely quaint, humorous, or nostalgic, became a medium for exposing the self-deceptions and distortions of reality that perpetuated racism.

Henry James did not invent international realism, but he perfected the genre. In *Roderick Hudson* (1876), *The American* (1877), *Daisy Miller* (1878), and other novels, he isolated aspects of the national character by placing his Americans in foreign social settings. Because James wrote almost exclusively about the genteel classes, he sometimes is mistakenly associated with the genteel tradition. But in his greatest works, such as *The Portrait of a Lady* (1881), he subtly but mercilessly deconstructed the self-serving myth of genteel society—that propriety is a hallmark of good moral character.

Stephen Crane is best known for the poetic images and psychological realism of his great Civil War novel, *The Red Badge of Courage* (1895), but no less important was his classic of urban realism, *Maggie: A Girl of the Streets* (privately printed in 1893, published in 1896). Like many early realists, Crane was a newspaperman. He drew upon his knowledge of New York City's slums to write his powerful and shocking account of a fragile young woman's degradation and death. Crane's use of violent incidents and street language, as well as his references to prostitution, broke new ground in American fiction but at the cost of offending critics and readers.

Though it often went beyond the bounds of social propriety, realism did not rule out virtue or self-determination in human affairs. Naturalism, which in many ways resembled realism, had no place for morality or free will. Grounded in the ideas of Herbert Spencer and Charles Darwin, naturalism posited a deterministic universe in which people are at the mercy of inexorable socioeconomic

or natural forces. Frank Norris's *McTeague* (1899) and Theodore Dreiser's *Sister Carrie* (1900) are classics of the genre.

Two idiosyncratic but indispensable authors wrote as if realism and naturalism were nonexistent. Ambrose Bierce's tall tales and stories of war and horror were experiments in improbability, the very antithesis of realism. Herman Melville's *Billy Budd* was a true anomaly: set in 1797; written in Melville's rich 1850s manner; composed between 1888 and 1891; and left unfinished at his death, only to be recovered and published in the 1920s. His tale of innocence and evil, justice and order, has layers of allusion and meaning that make all but the best realism and naturalism seem constricted and superficial.

Also outside realism and naturalism were the utopian novelists. Troubled by the social discord that they attributed to contemporary capitalism's plutocratic power structure, its unseemly scramble for wealth, and its economic inequities, many authors were moved to create projections of a better society. The second half of the 19th century saw the publication of no fewer than 48 utopian novels, nearly all of which preached that collectivism and futuristic technologies could bring about economic justice and social harmony. EDWARD BELLAMY's *Looking Backward, 2000–1887* (1888) spawned a movement to nationalize industry. *A Traveler from Altruria* (1894) by William Dean Howells was a socialist tract. *Caesar's Column* (1890), Ignatius Donnelly's strange futuristic novel, projected apocalyptic destruction as the necessary prelude to a better world.

Unlike the fiction of the period, which by and large was committed to finding new ways to depict contemporary reality, poetry was generally traditional in form and content. American poetry typically conformed to British models and appeared indifferent to the issues that energized contemporary fiction. Poets of the well-entrenched genteel tradition (classical, formalist, idealist, elitist, and cosmopolitan) frequently treated their own time and place by indirection, reconstructing legendary tales and classical symbols to illuminate moral or spiritual dilemmas. Sidney Lanier, the most highly regarded poet of the age, glorified the chivalric tradition. He was a supreme technician who infused his work with musicality and sensory imagery. Other notable traditionalists were George Cabot Lodge, Richard Hovey, and three Harvard poets—Trumbull Stickney, William Vaughn Moody, and George Santayana (though Santayana later criticized the genteel tradition for being “grandmotherly” and “sedate”).

Genteel poetry coexisted with a Whitmanesque strain that was less formal, more passionate, democratic in spirit, and regional in outlook. Joaquin Miller was a self-promoting poet who fancied himself the Walt Whitman of the West. He had the manner, but not the talent, as *Song of the Sierras* (1871) revealed. Whitman himself survived into

this era (he died in 1892) but wrote no major poetry in his last years. His most important contribution to the literature of the Gilded Age was a work of prose, *Democratic Vistas* (1871).

Most Americans favored neither genteel nor Whitmanesque poems, but some version of popular poetry. It was usually brief, simple in form, and humorous or sentimental in tone. James Whitcomb Riley, America's best-selling poet, was the master of the genre. His *The Old Swimmin' Hole and 'Leven More Poems* (1883) is a representative collection.

Three noteworthy poets elude categorization. Stephen Crane, in *The Black Riders* (1895) and *War Is Kind* (1899), experimented with parable and free verse to attack conventional religious faith, uplift, and optimism. His iconoclastic tone and precise imagery anticipated the modernists of the first quarter of the 20th century. Herman Melville (1819–91), virtually unknown during these years, nevertheless wrote the most ambitious poem of the era. *Clarel* (1876), a spiritual epic about a pilgrimage to the Holy Land, explored the major philosophical and theological concerns of the latter 19th century. EMILY DICKINSON, nearly all of whose work was published posthumously during the 1890s and neglected from about 1900 to World War I, had little effect on her contemporaries, though she is today the best-known poet of her age. Deceptively simple but powerful in image and emotion, Dickinson's lyrics are a remarkable record of emotions, insight, and observation. Notwithstanding the poems of Crane, Melville, and Dickinson, the great periods of American poetry were in the recent past (the American renaissance of the 1850s) and the immediate future (modernism).

The legacy of fiction was more substantial. At the level of individual talent, it produced three writers of genius and originality: Crane, James, and Twain. Realism and naturalism generated a vivid fictional record of a pluralistic nation in turbulent times. The topical novels of the period documented the decline of Victorianism and the emergence of modern attitudes about race, class, gender, marriage, and morality, while Edward Bellamy's utopianism profoundly influenced American notions of the good society. And Melville, the forgotten man of the American Renaissance, left behind a remarkable "buried treasure" to be unearthed by future generations. Add to these accomplishments the poetry of Emily Dickinson, and it would not be unreasonable to assert that from 1870 through 1900 American writers brought forth a body of work that was unsurpassed by any other period in the nation's literary history.

**Lloyd, Henry Demarest** (1847–1903) *editor, activist* Henry Demarest Lloyd, a social reformer, was born in New York City on May 1, 1847, the son of Aaron Lloyd and Marie Christie Demarest. A graduate of Columbia College (1867) and Columbia Law School (1869), Lloyd was admitted to the New York bar and then became involved in reform causes. From 1869 to 1872 he was assistant secretary of the American Free Trade League and a member of the Young Men's Municipal Reform Association.

In 1872 the *Chicago Tribune* hired Lloyd as its literary editor. A year later, he married Jessie Louise Bross, with whom he had four children. In 1874 Lloyd became the paper's financial editor and in 1880 was promoted to the position of chief editorial writer. Much of Lloyd's editorial work for the *Tribune* was concerned with the growth of TRUSTS and monopolies and the problems faced by the burgeoning labor movement. In 1881 the *Atlantic Monthly* published Lloyd's article "The Story of a Great Monopoly," in which Lloyd exposed the advantageous rates (rebates) the Standard Oil Company, with its huge shipments, secured from the Pennsylvania Railroad. This article was a great success and earned Lloyd a reputation as "the first muckraker." His subsequent articles revealed Lloyd to be a relentless champion of government regulation, independent competition, consumer rights, social reform, and the American worker.

In 1885 Lloyd resigned from the *Tribune* to work full time for social reform. Following the 1886 HAYMARKET RIOT and the conviction of anarchists (accused of throwing a bomb that killed police officers), he became involved in a clemency movement that succeeded in commuting the death sentences of two anarchists. Throughout the 1890s, Lloyd's interest in the labor-industrial conflicts of the day intensified. In 1893 he became an unofficial organizer of the Milwaukee streetcar workers and defended the actions of Eugene V. Debs and the American Railway Union during the PULLMAN STRIKE of 1894. Lloyd's involvement with the American labor movement led to the publication of his *Wealth against Commonwealth* (1894), denouncing monopolies and their socially destructive practices. Lloyd also became actively involved in the PEOPLE'S PARTY (Populist Party) and ran unsuccessfully for CONGRESS in

1894 on a Chicago Labor-Populist fusion ticket. That loss and the eventual absorption of the Populists by the DEMOCRATIC PARTY led Lloyd to abandon his plan of bringing about social reform through national politics. Embracing “social democracy,” Lloyd supported cooperatives as alternatives to monopolistic corporations, advocated municipal ownership of utilities, and favored compulsory collective bargaining in labor management disputes. Lloyd died in Chicago on September 28, 1903.

## lobbies and pressure groups

Lobbies and pressure groups conjure up images of smooth operators either corrupting or bullying sleazy or hapless members of CONGRESS to secure legislation profiting their clients at the expense of the commonwealth. The images are not completely fair, since there are interest groups whose main concern is the commonwealth and, for that matter, lobbyists representing selfish interests may rely on attractively packaged information rather than on bribes or strong-arm tactics. In any event, whether fair or foul means are relied upon, lobbies and pressure groups are an informal, but genuine, part of the legislative process, and they achieved significance during the Gilded Age.

After the Civil War, the federal government encouraged the building of RAILROADS, protected industries, and rewarded veterans. Bills to accomplish these objectives originated in an inexperienced Congress that was scarcely equipped to deal with them. Most congressmen served only a few terms, if that many, and had no staff to research the ramifications of pending legislation except for the clerks of the committees on which they served. Lobbyists were only too glad to educate legislators. For example, the Pacific Railway Act of 1862, with its generous land grants and loans to the Union Pacific and Central Pacific Railroads, was essentially written by Theodore D. Judah, a railroad engineer and a lobbyist for the Central Pacific whose expertise had secured him the positions of secretary of the Senate Committee and clerk of the House Committee on Railroads.

The power of the lobby can be overstated. Judah could shape the Railway Act because Congress wanted a trans-continental railroad. The efforts of the supposedly power-

ful Texas & Pacific Railroad lobby to secure a land grant by resolving the 1876–77 disputed election in favor of RUTHERFORD B. HAYES neither affected the outcome (despite what some historians believe) nor secured a land grant. The Democrats dared not extend their filibuster and plunge the nation into chaos, while Hayes was not interested in giving any more public lands to railroads. The most celebrated lobbyist of the Gilded Age, Samuel Ward, apparently was hired by railroads, steamship lines, and manufacturers to secure land grants, subsidies, and favorable tariff rates, and he had the good business sense to encourage his reputation as the “King of the Lobby.” The extent of his influence, however, can only be surmised, since he had all his papers relating to lobbying destroyed.

Lobbyists were effective, but only in details of policies Congress had embraced. Thus, James M. Swank, the arch-protectionist lobbyist of the American Iron and Steel Association, did influence tariff legislation by issuing millions of tariff tracts beginning in 1876. Swank was a statistician who relied on education, but John E. Searles, Jr., lobbyist for the Henry O. Havemeyer sugar trust, did more than inform Senator Nelson W. Aldrich, who took care that the tariff schedules reflected the interests of eastern sugar refiners: The sugar trust lent Aldrich enough money to acquire the street railways in Providence, Rhode Island, and made him a wealthy man. Aldrich was not purchased, since in any event he would have manipulated the tariff to benefit eastern manufacturers, but he profited in a corrupt fashion from his powerful position.

Lobbyists also tried to influence executive departments and represented humble people. For example, a major portion of BELVA LOCKWOOD’s law practice in Washington, D.C., dealt with representing veterans in presenting pension claims.

**Further reading:** Lately Thomas, *Sam Ward: “King of the Lobby”* (Boston: Houghton Mifflin, 1965); Margaret Susan Thompson, *The “Spider Web”: Congress and Lobbying in the Age of Grant* (Ithaca, N.Y.: Cornell University Press, 1985).

**Lockwood, Belva Ann Bennett McNall** (1830–1917) *educator, lawyer, women’s rights activist*

Born in Royalton, New York, on October 24, 1830, Belva Ann Lockwood was the first woman allowed to practice before the U.S. SUPREME COURT. She began teaching in local schools at the age of 15 and in 1848 married Uriah H. McNall, a sawmill operator who died accidentally five years later. To support herself and their daughter, she returned to teaching and furthered her own education by attending Genesee College. After graduating with honors in 1857, she became the principal of the Lockport, New York, Union school. An innovative educator and a believer

in WOMEN'S RIGHTS (she met SUSAN B. ANTHONY), Lockwood broadened the curriculum for women with liberating courses in public speaking and gymnastics. After teaching in other New York schools, Lockwood moved to Washington, D.C., in 1866 and established one of its first coeducational schools. Two years later she married Ezekiel Lockwood, who took over the administration of her school while she pursued her ambition to become a lawyer.

Lockwood overcame great obstacles in that pursuit. Her applications to law schools were rejected (one because she would divert the attention of male students from their studies) until 1871, when the newly established National University Law School admitted her and some other women. In 1873, however, that school tried to deny a diploma to her and to another woman who had completed her training, since the male graduates did not want to graduate with women. Lockwood appealed to President Ulysses S. Grant, the ex-officio president of the school, who not only saw that the women received their degrees but also that Lockwood was immediately admitted to the District of Columbia bar. She began her practice of law only to have the federal Court of Claims refuse to allow her to plead a case before it, and her petition to practice before the SUPREME COURT was denied in 1876 on the grounds that women traditionally did not practice before it. Undeterred, Lockwood lobbied CONGRESS and in 1879, with the support of Senators Aaron A. Sargent and GEORGE FRISBIE HOAR, it passed an act entitling women to practice before the Supreme Court. In that same year, Lockwood became the first woman allowed to practice law before the Supreme Court.

While advancing the rights of women in her profession, Lockwood also fought for the rights of all women. In 1867 she helped organize the Universal Franchise Association in Washington, and in the 1870s she was especially active in the National Woman Suffrage Association (NWSA). By circulating petitions, she helped secure legislation guaranteeing equal pay for female federal employees.

Lockwood believed that independent political action by women was the best way to achieve equal rights. Accordingly, she spoke in favor of VICTORIA WOODHULL's presidential candidacy in 1872, and when that collapsed she supported the LIBERAL REPUBLICAN candidate Horace Greeley. In 1884 Lockwood made Anthony and other suffragists in the NWSA who were working through the Republican Party unhappy when she accepted the presidential nomination of the Equal Rights Party on a platform of equality for all, woman suffrage, uniform marriage and divorce laws, CIVIL SERVICE REFORM, veterans pensions, prohibition, and peace. Although she polled only a little more than 4,000 votes, she and her cause received much publicity, and in 1888 she ran again for the Equal Rights Party. Indeed, her law practice, which concentrated on pension claims, prospered as a result of her candidacies.

Lockwood never gave up on woman suffrage, but her candidacies had soured her relations with the suffragists, and she began to concentrate her energies on world peace through the arbitration of disputes. She belonged to the Universal Peace Union, was a delegate to international peace congresses, and served on the nominating committee of the Nobel Peace Prize. In her final year she campaigned for Woodrow Wilson because he had kept the United States out of war. She died in Washington on May 19, 1917, one month after the United States entered World War I.

## lynching

The popular image of lynching, which occurred with great frequency in the Gilded Age, includes a white mob, a black victim, and a rope for hanging. In reality, lynching is more complicated and more consequential. Stripped down to basics, lynching is murder—killing outside the law, destroying a life without due process. It involves, in historian Leon Litwack's words, the "slow, methodical, sadistic, often highly inventive forms of torture and mutilation." Historically, it almost always included a mob—a loosely organized, emotionally aroused group of white men from all walks of life (occasionally with women and children cheering from the sidelines)—pursuing a black man alleged to have committed a crime or shown disrespect to whites. Mob leaders and participants came together to uphold the standards of society as they saw them; from a more objective perspective, the allegations were unproved, the standards discriminatory, and the objective the denigration of human beings of a different skin color.

While lynching generally meant murder by hanging, white mobs also used guns, whips, fire, and other methods to kill and torture their prey. Most victims were African-American men, but sometimes a white man or woman was lynched. Most lynchings took place in the South, but occasionally lynch mobs north of the Mason-Dixon line mobilized for the slaughter. The statistics on lynching do not include unreported lynching events; as a result, the available data document what was presumably only a fraction of violent black deaths at the hands of whites.

Early in 1882 the *Chicago Tribune* began to publish what became its annual accounting of lynchings. It is the initial source of reported lynchings; other sources appeared later, but reports of lynchings prior to 1882 are reconstructed and not contemporary accounts. After the Civil War, the Ku Klux Klan held their lynching parties well before the *Tribune* started counting. By the end of Reconstruction, southern whites, again in control of their

Most lynching victims were African-American men, such as the one in this photograph. (Library of Congress)

states, saw lynching as a positive pressure to keep AFRICAN AMERICANS subordinated and disciplined. By that time, a recent study concluded, the familiar imagery of organized night-riding terrorists was succeeded, at least in part, by the passionate violence of lynch-mob justice. The *Chicago Tribune's* first tabulation recorded 44 southern lynchings; 34 of the victims were black. The numbers grew in a jagged sequence, reaching highs in the four years between 1891 and 1894 (121, 129, 116, 117). The occasional lynchings outside of the 10 southern states are not recorded.

One analysis suggests that there were four distinct types of lynching: Small mobs of less than 50 persons can be classified as either terrorist or private. The terrorist mob, like the Ku Klux Klan or night riders, specialized in flogging victims, burning their homes, and chasing them out of town. Death was a frequent side effect. Private mobs ranged in numbers from a very few up to 50, and their object was vengeance for real or imagined acts. Death was an invariable consequence. Neither of these two mob types pretended that they were supporting the law.

A third type was the posse, a familiar feature of early western movies. In the South, a lynching posse could number from a handful of people to hundreds. They hunted their victims down in the belief that they were upholding the law and then stepped over the line by killing their victim without a trial. A fourth type was the mass mob, consisting of anywhere from 50 persons to, on rare occasions, thousands. Generally, their pursuit was brief, a day or less, brutal, and sometimes marked with great ceremony. The bodies of victims were often dismembered and the parts—a finger or an ear, for example—claimed by lynchers and onlookers as mementos of the chase.

Determining the causes of irrational acts of lynching has intrigued historians and social scientists for generations, but the explanations are still inconclusive. Lynchers often boasted that their act would deter other black Americans from breaking the law or the white-established social code. On a more analytical level, many white workers and white planters feared that African Americans offered competition in the labor market and the voting booth, and lynchings reminded black Americans to stay in their place. African Americans who struggled out of the pit of poverty to own land and a small farm threatened the status of lower-class whites who were less successful economically or socially. The coincidence of lynching to cotton prices and production is demonstrable. More lynchings in the 1880s and 1890s took place in states heavily dependent upon cotton when its prices were sliding, but it is difficult to verify a cause-and-effect relationship.

Lynching was a grim exposure of white apprehensions. It is clear that as a general rule after the end of slavery, whites deemed that a strict structure of social control was essential to keep African Americans a servile, voteless, laboring underclass. Until disfranchisement and a rigid segregation were securely in place by the beginning of the 20th century, maintaining control could be nerve-racking. It is more than coincidental that when those controls were firmly fixed, the number of lynchings began a slow decline. Nevertheless, it is perplexing to unravel the intricate and complex motivations that led mobs of men to murder.

Given the overwhelming numbers of whites and the fear that the lynching process generated, it was impossible for family and friends to protect an intended victim or to retaliate. In 1892, however, a young African-American woman editor of a weekly paper in Memphis had had enough killing and lashed out in her paper about “a town which will neither protect our lives and property, nor give us a fair trial in the courts, but takes us out and murders us in cold blood when accused by white persons.” IDA B. WELLS-BARNETT was chased out of Memphis for her verbal attack and her newspaper office destroyed. She settled in the North and became the leading and loudest voice to

attack lynching and its perpetrators in speeches, newspaper articles, and pamphlets, even traveling to England to stir antilynching sentiment across the Atlantic. Six years later, when a changing Wilmington, North Carolina, political situation depended on racial cooperation, whites used their greater numbers to instigate a riot that killed an estimated 300 African Americans, caused thousands to flee for their lives, and introduced an intransigent segregated society. Hopelessly outnumbered, black Americans tried to fight back against insurmountable odds. Whether or not the Wilmington battle set a precedent, African Americans have since that time increasingly stood up for their rights despite riots, lynchings, segregation, and other forms of racism. It was this growing strength of resistance that helped to limit lynching and call attention to more subtle forms of racism.

The first year of the new millennium continued the renewed interest in the study of lynching. *Witness*, a dra-

matic photographic exhibit, was mounted in New York City, and *Without Sanctuary*, a book of photographs and essays, was published and praised. What should people take away from the exhibit?, the gallery owner was asked. "Questions," he replied. "Questions about our culture, our history, our times." What did one reviewer think of the book? It was, she said, "the gift of knowledge, the chance for greater consciousness and caring."

## **MacDowell, Edward Alexander** (1860–1908)

*composer*

In his own time, Edward MacDowell was considered to be the first great American composer, and he was the first American-born composer whose works were published and widely performed in Europe. MacDowell was born in New York City on December 18, 1860, the third son of Thomas and Frances Knapp McDowell. (MacDowell changed the spelling of the family name in the late 1870s.) He began piano lessons at the age of eight with Juan Buitrago, a Colombian violinist who was a boarder in the McDowell home. He also took occasional lessons from the young Venezuelan pianist Teresa Carreño, who later became a champion of his music. Showing exceptional promise, at the age of 16 he moved to Paris with Buitrago and his mother to continue his studies. He won a scholarship and full admission to the Paris Conservatory in 1877. In 1879 he entered the Hoch Conservatory in Frankfurt, where he studied composition with conservatory director Joachim Raff. He left the conservatory after one year but remained in Germany, composing, teaching, and performing until 1888. In 1884 he traveled to the United States to marry Marian Nevins, one of his piano students. The couple returned to Germany and settled in Wiesbaden. He was strongly encouraged by Franz Liszt, who recommended his works for performance and publication. During these years in Germany, he composed prolifically, completing many works for piano, songs, part-songs, two piano concerti, the *Romanz* for cello and orchestra, and three orchestral tone poems.

In 1888 MacDowell and his wife returned to the United States and settled in Boston, where his reputation was quickly established. Within a year he had performed his Second Piano Concerto, op. 23, with the Boston Symphony Orchestra under Wilhelm Gericke and in New York with an orchestra under the direction of Theodore Thomas. During his years in Boston, he continued to compose, teach, and perform, and his music was heard frequently in Ameri-

can concert halls. In 1896 MacDowell moved to New York City to accept appointment as the first professor of music at Columbia University. For the next eight years he devoted himself tirelessly to the creation of a music department. In addition to his academic responsibilities, he conducted the Mendelssohn Glee Club, a prominent New York men's chorus. From 1899 to 1900 he served as president of the newly formed Society of American Musicians and Composers. MacDowell resigned his position at Columbia in 1904 following a dispute with the university president, Nicholas Murray Butler. By 1905 he was showing signs of the mental illness that plagued him during his last years. He died of paresis (general paralytica) in New York City on January 23, 1908.

Although MacDowell was an American composer, his music was firmly within the late romantic European tradition. Some of his best-known works, such as *Indian Sketches* and *From Puritan Days*, celebrated American themes. Yet his compositional style reflected the influence of Schumann, Liszt, Wagner, and Grieg. He resented concerts of exclusively American music and at times refused to participate in such events. He disliked being categorized as an American composer, preferring to be recognized as a composer whose nationality happened to be American. In the final years of his life, MacDowell dreamed of creating a retreat for artists, writers, and musicians on the property of his summer home in Peterborough, New Hampshire. In 1907 his wife realized his dream by founding the MacDowell Colony, which was destined to become one of the most important arts colonies of the 20th century.

—William Peek

### machine politics

Political leaders preferred to think that they headed organizations, but their opponents referred to them pejoratively as “bosses” and their disciplined followers as “machines.” In fact, fielding candidates and winning elections necessitated the formation of organized political parties. American parties are decentralized and comprise local units that are built from the ground up. In the Gilded Age, political organizations were fine-tuned to the point that, in many urban areas and in some states, they achieved machinelike efficiency.

The Democratic machine in New York City, TAMMANY HALL, and the Republican machine in Pennsylvania are the most renowned, but they were not alone, since virtually all politicians attempted to organize their supporters.

The basic element in all political machines was the worker in direct contact with voters. In cities it was the precinct captain who knew everyone and their problems, offered them help when needed, and made sure they got to the polls. Above the precinct captain was the ward boss and above him the district leader and, ultimately, the urban boss. Since no one working 10 hours a day for six days a week could find the time or energy to be in such close contact with the electorate, the political leader in whose interest they worked found them jobs in the municipal, state, and federal civil service where they put in less than a full day for a good salary. With their livelihood dependent on victory at the polls (since the opposition, if triumphant, would replace them with its party hacks), political workers did their utmost for the machine.

Political machines were most difficult to overthrow in the Gilded Age because direct primary elections for candidates were rare. The first mandatory primary law was adopted in 1903 in Wisconsin, and the passage of similar laws in other states hampered the activity of political machines in the 20th century. In the late 19th century, however, nominations for local, state, and national offices were made by conventions whose delegates were also selected by conventions. Hence, local conventions would nominate local candidates and also select delegates to the county convention and so up the line to the quadrennial national convention. To overthrow a boss, reformers had the daunting if not impossible task of gaining control of local conventions, which were often held in saloons and occasionally in bordellos.

Machines were occasionally overthrown and often threatened, but they were either repaired or prevailed. Their operators were tenacious, while reformers—as GEORGE WASHINGTON PLUNKITT of Tammany Hall observed—faded like morning glories. But political bosses, while clinging to power, accomplished little beyond running their machines. The Republican machine in Pennsylvania had a remarkably long life, but its operators—Senators Simon and

Donald Cameron, Matthew Quay, and Boies Penrose—had virtually no legislative impact. They were able men, but when not dealing with major revolts by local Philadelphia or Pittsburgh machines or by reformers, they were consumed by the minutiae involved in balancing the demands of minor politicians in every small town in the state.

### Mafia incident (1891)

A diplomatic controversy between the United States and Italy in 1891 grew out of the LYNCHING of Italian nationals by a New Orleans mob. In the 1890s New Orleans was plagued with criminal gang violence that was blamed on supposed members of the Sicilian Mafia among the recent flood of emigrants from southern Italy. Police superintendent David C. Hennessy launched a campaign against the gang warfare but was assassinated just before he was to testify in court on October 15, 1890. Nineteen men were arrested and charged with murder, but a trial of nine resulted in no conviction. On March 14, 1891, a mob calling itself the Committee of Fifty murdered 11 of those in custody, among whom were three Italian citizens.

The Italian minister to the United States, Baron Francesco Saverio Fava, demanded that the members of the mob be punished and an indemnity be paid. Secretary of State JAMES G. BLAINE informed Baron Fava that the federal government could not punish the lynch mob because it had no jurisdiction in the case. Italians were outraged. Unable or unwilling to understand the workings of federalism, the Italian government called Fava back to Italy in protest. Thereafter, President BENJAMIN HARRISON recalled the U.S. minister from Rome and refused to discuss the incident as long as the Italian minister was absent. In fact, most Americans, given their ethnic prejudices and their tolerance for lynching, remained unfazed by the Mafia incident.

Although it was disturbed, the Italian government did not want war. In a conciliatory gesture, Italy dropped its ban on the importation of American pork. In December 1891 Harrison announced in his annual address that the lynching was a deplorable act, but he reiterated that he would only discuss the matter if the Italian minister returned to Washington. Italy was ready to send Fava back when the United States agreed to the principal of an indemnity, but Harrison, feeling that he had done so already in his annual address, refused to do anymore. Secretary of State Blaine, who had just recently returned to work after an extended

illness, informed the president that drawing out the negotiations over a minor point was more embarrassing than having to pay damages. He also reminded Harrison that since Italy would appoint an arbitrator to the international panel empowered to resolve the **BERING SEA DISPUTE** with Britain, it was in the nation's best interest to be reconciled with Italy. Harrison understood, and in March 1892 he sent the American minister back to Rome. One month later the United States paid Italy an indemnity of \$24,330.90, and Italy sent Baron Fava back to Washington.

## magazines

In the years following the Civil War, there was a surge of magazines appearing in the United States. The number of periodicals published grew from 700 in 1865 to 3,300 by 1885, and magazines began to target specific reading populations. Americans had more leisure time for reading because of the technological advances of the Industrial Revolution. Machines produced vast quantities of goods, created great wealth, and revolutionized **COMMUNICATIONS**. Americans began to travel both within their own country and to Europe at a greater rate. Magazines, the most important source of literary pleasure, reflected these changes and focused on entertainment, leisure, travel, and fashion. As Americans lost interest in the issues of Civil War and Reconstruction, they sought diversion. Established monthly magazines like *Harper's*, *Scribner's*, and the *Atlantic* continued to concentrate on short stories, serialized novels, and poetry, but other journals became “niche” publications marketed to an increasingly professionalized American society with special needs.

Magazines began accepting advertisements, and their style of writing changed to lighter, less-serious prose. Articles now ran with bylines rather than anonymously. Magazines for women increased in number, but most of them surprisingly opposed woman suffrage. As a result, smaller journals spoke for women's rights, including the very outspoken *Woodhull and Claflin's Weekly* (1870–76). At the same time women's fashion magazines including *Harper's Bazaar* (1867 to present) flourished, but the first magazine to reach 1 million subscribers, the *Ladies' Home Journal* (1883 to present), celebrated domesticity. Founded by Cyrus H. K. Curtis and initially edited by his wife, Louisa Knapp, the *Ladies Home Journal* flourished under his son-in-law Edward W. Bok and had 5 million subscribers by 1900.

Specialized magazines grew enormously during the Gilded Age, with new periodicals focusing on the sciences, engineering, manufacturing, and mechanics. Professional journals for physicians and teachers sprang up, agriculture and farm journals proliferated, sports magazines began publishing, and a number of monthly magazines for children appeared. Weekly magazines devoted to news and commentary included popular journals with their woodcut illustrations like *Harper's Weekly* (among its featured artists were **WINSLOW HOMER** and cartoonist **Thomas Nast**) and *Frank Leslie's Illustrated Newspaper* and the era's most outstanding journal of opinion, the *NATION*, edited by **EDWIN L. GODKIN**. Several publications devoted to humor (preeminently *Puck*, 1877–1918) and illustrations (mainly *Life*, 1883–1936) appeared. *Puck* was distinguished by a double-page cartoon in the center-fold, printed in color and drawn by artist Joseph Keppler.

Cartoon by James Albert Wales showing James A. Garfield and Winfield S. Hancock pressing a Chinese immigrant between Republican and Democrat anti-Chinese planks (1880) (*Library of Congress*)

*Life* was known for outstanding black-and-white drawings, especially by Charles Dana Gibson, who invented a “look” for an entire generation of young women with his stunning and sophisticated Gibson Girls. Local and regional magazines took hold, including the “city weekly” best exemplified by *Rolling Stone* (1894–95) edited in Austin, Texas, by William Sydney Porter (O. Henry). These magazines mixed politics, entertainment, society chit chat, and light literary fare.

In the last third of the century, the larger national magazines increased their circulation because the advent of second-class postage in 1879 and rural free delivery in the 1890s enabled them to reduce their cost generally to 20 cents per issue. Some, like *Munsey's Magazine* and *Godey's Lady's Book*, charged only a dime, and the *Ladies' Home Journal* went on sale for a nickel. These price cuts were helped along by cheaper paper, lower printing costs, and halftone engraving.

At the turn of the new century, popular magazines were heavily illustrated and fiction had been deemphasized in favor of politics, history, and economics. Magazine publishers recruited writers from other magazines instead of from NEWSPAPERS, as in the early 1800s. Magazines in America were becoming, like their older newspaper siblings, a moneymaking business, with national circulation. Their tone had changed from polite to frank, and they were ready to wield enormous influence as “muckrakers,” exposing corrupt politicians and monopolistic TRUSTS and paving the way for progressive reforms.

**Mahan, Alfred Thayer** (1840–1914) *naval historian*  
Alfred Thayer Mahan's influential books argued that seapower, accompanied by a flourishing MERCHANT MARINE, was essential for world power, and that maritime nations that established, exploited, and retained colonies—in peace and war—were blessed with strong economies. Born on September 27, 1840, Mahan graduated from the U.S. Naval Academy in 1859, and although a veteran of the Civil War, he was more scholar than sailor. Beginning in 1884 he taught at the Naval War College in Newport, Rhode Island, and wrote two histories of naval warfare, *The Influence of Sea Power upon History, 1660–1783* (1890) and a sequel covering the French Revolution and Napoleonic war (1892). His writings, appearing when industrial powers either were carving or were preparing to carve colonies out of Africa and Asia, inspired imperialist policy makers abroad in Great Britain, Germany, Japan, and elsewhere.

At home, expansionists like Theodore Roosevelt, JOHN HAY, and Henry Cabot Lodge—who advocated a large, modern, steel navy to promote exports abroad—regarded Mahan as their prophet, but they extrapolated more from his writings than he intended.

Mahan's IMPERIALISM was limited by his concept of the strategic defensive perimeters of the United States. Those perimeters extended south to include the Caribbean Sea and Central America and stretched west into the Pacific Ocean 3,000 miles from San Francisco. In that area he wanted the navy to be paramount, and to maintain its strength, he wanted the United States to annex HAWAII and to control an isthmian canal and its approaches. Unlike his expansionist American disciples, he was not anxious to acquire territory or to thwart the designs of other nations beyond his perimeters. He was reluctant to take the Philippines, since they would be difficult to defend in a war with Japan, and he thought that trying to maintain the OPEN DOOR in remote China was unwise, since the United States had neither the will nor the capacity to wage war in defense of either China's territory or its minuscule trade with America. Mahan even doubted the wisdom of enforcing the Monroe Doctrine south of the Amazon River.

Prior to Mahan, other naval officers had advocated increased spending on the fleet and the acquisition of an interoceanic canal and naval bases, but unlike Mahan, they lacked a popular audience. Although today his writings are better known than read, in the 1890s he profoundly influenced the public, policy makers, and scholars. Indeed, his esteem among historians was such that he was elected president of the American Historical Association in 1902. Mahan died on December 1, 1914.

### mail-order houses

A nationwide rail system created a national market in place of local and regional markets and gave rise to mail-order houses. Efficient express companies, utilizing widespread rail facilities, could speed packages to villages throughout the country and could serve most of the populace. The U.S. Post Office reduced rates and began rural free delivery in 1896, but it did not inaugurate parcel post service until 1913. In 1879, however, CONGRESS aided rural Americans and mail-order houses when it provided that packages of up to four pounds could be mailed throughout the country at the flat rate of one cent an ounce. Mail-order houses existed prior to the Civil War, but they stocked only

a few items and their market was limited by inadequate transport.

In 1872, the year after the great CHICAGO FIRE, Aaron Montgomery Ward began his mail-order business in Chicago, a rail hub. To keep his prices low, he would buy in bulk with cash and eliminate middlemen by selling and shipping directly to the rural consumer for cash. He established close ties to the GRANGER MOVEMENT and claimed to be “The Original Grange Supply House,” selling goods to Grange cooperative stores and to members of that farm organization. He further cultivated the good will of his customers with the slogan “satisfaction guaranteed, or your money back.” In 1889, with sales at \$2 million and profits at \$115,000, Ward and his partners established Montgomery Ward & Company, and by the 1890s its catalog—the “wish book” containing 24,000 items—had brought the DEPARTMENT STORE into the home and changed forever the buying habits of rural Americans.

In 1891 Richard Warren Sears and his associate in retailing watches, Alvah Curtis Roebuck, formed a partnership that became Sears, Roebuck and Company to compete with Montgomery Ward. Sears took great risks, expanded during the depression of the 1890s, bought out the nervous Roebuck, and in 1895 acquired Aaron Nusbaum (who pulled out in 1901) and his brother-in-law Julius Rosenwald as partners. With Sears, who was a gifted salesman with a knack for advertising, handling the merchandising and Rosenwald, a brilliant organizer, conducting the rest of the business, Sears, Roebuck took off, passed Montgomery Ward, and grossed \$10 million in 1900. In competition with Ward, Sears did not innovate but met Ward head on, claiming lower prices, superior goods, better guarantees, more selections, and simpler order forms. Although Sears, Roebuck advertised widely, its best advertisement was its catalog—a larger wish book than Montgomery Ward’s—that by 1908 had 100,000 items, including automobiles. But in that year Sears’s risk taking was more than Rosenwald could stand and he forced Sears to resign as president.

Hoge Sr., *The First Hundred Years Are the Toughest: What We Can Learn from the Century of Competition between Sears and Ward* (Berkeley, Calif.: Ten Speed Press, 1988).

### **Maine, Remember the** (1898)

The battle cry of the SPANISH-AMERICAN WAR, coined by the jingo press, whipped up war sentiment after the USS *Maine* was destroyed in an explosion while anchored in

Havana harbor. The sinking served as the cause for the United States to declare war on Spain. The battleship *Maine* arrived in CUBA, ostensibly for a “friendly” naval visit, at 11:00 A.M. on January 25, 1898. With Spain involved in a vicious colonial war with Cuban rebels, such visits had been avoided since 1895, but as American sympathy for the rebels grew, so too did anti-American sentiment among Spanish loyalists in Havana. Rioting in Havana on January 12, 1898, worried the American consul, Fitzhugh Lee, who cabled that “ships may be necessary later but not now.” Although Havana calmed down, the McKinley administration on January 24 ordered the *Maine* to Havana.

The *Maine* was a second-class battleship, weighing 6,682 tons and with a maximum speed of 17 knots. Although Spanish officials would rather the *Maine* were elsewhere, they were cordial and the city was calm. Nevertheless, Captain Charles D. Sigsbee did not allow his sailors liberty for fear of an incident. Security on the ship was high. The ship’s watch was greatly enlarged and sentries were armed. Both boilers were kept going—a departure from the usual practice of operating a single boiler—in case the ship was called to immediate action, and shells were kept near all of the *Maine*’s guns.

At 9:40 on the evening of February 15 an explosion ripped through the *Maine* and sent it to the bottom of the Havana harbor. With the entire forward part of the vessel destroyed, 260 men were killed (out of a crew of 355). NEWSPAPERS immediately attributed the explosion to Spanish treachery and called for war. A naval court of inquiry concluded on March 20 that an underwater mine sank the *Maine*, although responsibility for laying the mine could not be determined. The Spanish offered to send the matter to arbitration in order to settle the cost of the damage and even agreed to an armistice (to last as long as the commanding general in Cuba thought prudent) in the war on the Cuban rebels. But the United States was in no mood for arbitration or for negotiations.

President WILLIAM MCKINLEY had experienced the carnage of war firsthand as an officer during the Civil War. He hoped that the report’s inability to blame the Spanish for the sinking would leave open an opportunity to negotiate a peaceful settlement of the sinking and of the political status of Cuba. But public sentiment was not with him. Reports of Spanish atrocities in Cuba both real and imagined and the mass starvation produced by Spain’s military policies created great sympathy for the Cuban rebels. The publication a few weeks before the explosion of the *Maine* of the DE LÔME LETTER, in which the Spanish minister had made derogatory remarks about the president, abetted the growth of war fever in the United States. Bowing to pressure, McKinley on April 11, 1898, asked CONGRESS for the authority to use the armed forces to intervene in Cuba. Congress debated for a week before agreeing on April 19

The U.S. battleship *Maine* (Library of Congress)

by joint resolution. McKinley signed it the following day and the war began.

Seventy-eight years later a study, using the latest naval technology, by Rear Admiral Hyman Rickover of the U.S. Navy concluded that an internal explosion occurring in one of the coal bunkers had caused the sinking of the *Maine*.

**Manifest Destiny** See IMPERIALISM.

**Marsh, George Perkins** (1801–1882) *scholar, politician, conservationist*

A universal and prophetic scholar as well as a diplomat, George Perkins Marsh was born on March 15, 1801, in Woodstock, Vermont. As a boy, he was an avid reader,

but eye trouble periodically forced him to forsake books. When he did, he communed with nature and contemplated the impact of people on the flora and fauna of Vermont. With virtually no formal education Marsh entered Dartmouth College in 1816, where he excelled in languages (besides studying the classics, he picked up the Romance languages and German). When he graduated in 1820, he taught Greek and Latin at an academy, but an unhappy year in the classroom and renewed eye problems led him to study law with his father and brother. Admitted to the bar in 1825, he moved to Burlington, seat of the University of Vermont, whose president was his cousin James Marsh.

George Perkins Marsh's passion was scholarship, not pleading mundane cases in the courtroom, and he began the study of Scandinavian languages, while courting vivacious Harriet Buel, whom he married in 1828. They had two sons, but Harriet, who had a heart problem, died in August 1833, 11 days before their older son died of scarlet fever. "Saved . . . from madness" by "a constant succession of severe labors," Marsh plunged deeper into the study of Scandinavian languages and literature. He sought philosophic solace and intellectual stimulation from his cousin James and the university faculty.

An inheritance from his father-in-law and wife enabled Marsh to become involved in business. He invested in the Vermont Central Railroad and became a banker, sheep raiser, and woolen manufacturer. In 1839 he married Caroline Crane, who “magnified his enthusiasms” and “minimized his misfortunes,” and with whom he had no children. Although she remained supportive, Caroline soon suffered from a stroke and other impairing ailments.

His dependence on a protective woolen tariff led March to enter politics. Although an elitist in democratic Vermont, voters appreciated his knowledge, integrity, and pro-tariff and antislavery positions. Elected as a Whig to Congress in 1843 and twice reelected, Marsh served until 1849, opposing the annexation of Texas and the Mexican-American War. His most congenial work was on the Joint Committee of the Library of Congress, helping shape the Smithsonian Institution.

As a reward for his support of Zachary Taylor in 1848, Marsh was appointed minister to Turkey, serving from 1849 to 1853. His facility in the diplomatic language of French proved especially helpful, and his great capacity to learn languages (at this point, he knew approximately 20) was useful. Hungarian, Polish, and Italian refugees from failed 1848 revolutions (Marsh suspected some of them were fugitives from justice), desirous of passports, were Marsh's biggest headache. He and the legation did their best for the Hungarian revolutionary Louis Kossuth, whom Marsh came to despise as an ingrate. Marsh and his family toured Egypt, Palestine, Lebanon, France, Austria, and Italy (where they sipped tea with Robert and Elizabeth Barrett Browning). Always the scholar, he recorded geographical and meteorological data and collected specimens of flora and fauna for the Smithsonian.

Recalled by the administration of the Democrat Franklin Pierce, the Marshes returned home at a leisurely pace, since the Vermont Central Railroad, in which he had invested heavily, had gone bankrupt. They left Constantinople (Istanbul) on Christmas Day 1853, explored Sicily, spent two months in Rome, worked their way north to Switzerland, and arrived back in Burlington in August 1854. March was \$50,000 in debt to close associates, who had cheated him. After six years of negotiations, his debt was reduced to \$10,000, which he paid off when Congress reimbursed him for legitimate expenses in Turkey.

During these years he designed fine surveying instruments, but the venture was not profitable. He also persuaded the U.S. Army to use camels (whose value he had discovered in Egypt) in the Great American Desert, as the Southwest was then called. He was appointed a Vermont fish commissioner and found that people were responsible for the decline of fish in lakes and streams. When the Vermont statehouse burned in 1857, Marsh planned the new statehouse, which architect STANFORD WHITE called

the nation's “finest specimen of Greek architecture.” As the state's railroad commissioner (1857–59), he castigated corrupt railroad managers and would have rewritten Vermont's railroad code if the legislature had agreed. Experience taught Marsh that all transport and communications facilities should be government owned. In 1858 he taught the English language and literature at Columbia and two years later published *Lectures on the English Language*, which reviewers praised for “profound scholarship.” That triumph led to lectures at the Lowell Institute in Boston, published in 1862 as *The Origin and History of the English Language and of the Early Literature It Embodies*, which gave Marsh an international reputation as a philologist, an etymologist, and an early associate of the *Oxford English Dictionary*.

Marsh joined the new Republican Party, supported its candidates, hoped for a foreign mission, and in 1861 Abraham Lincoln's administration named him minister to the recently united Kingdom of Italy, where he remained until his death. He performed his duties well, enjoyed the social and cultural opportunities Italy afforded, and pursued his varied interests. At the behest of President RUTHERFORD B. HAYES, Marsh prescribed the precise height of the Washington Monument (10 times its width), when that obelisk was completed in 1885. He loved art and helped New York's Metropolitan Museum of Art acquire paintings. In 1864 he published his most influential book, *Man and Nature, or Physical Geography as Modified by Human Action*, which he revised in 1874 as *The Earth as Modified by Human Action*. He had collected material for that book on his boyhood hikes in Vermont and made observations for it during his extensive travels and while he read voraciously. “Man,” he declared, “is everywhere a disturbing agent. Wherever he plants his foot, the harmonies of nature are turned to discord.” This work, which became a classic, marked the beginning of the CONSERVATION movement by arousing ENVIRONMENTAL CONCERNS, which for him were constant. On the last day of his life, July 23, 1882, Marsh, who was reworking *Man and Nature*, added fresh observations on forests.

**Further reading:** David Lowenthal, *George Perkins Marsh: Versatile Vermonter* (New York: Columbia University Press, 1958).

**Marsh, Othniel Charles** (1831–1899) *paleontologist, naturalist*

Lockport, New York, the place of Othniel Charles Marsh's birth on October 29, 1831, influenced his eventual distinguished career as a paleontologist. Fields, woods, and the fossil-rich Erie Canal excavations near his father's farm turned him toward the study of nature. His advanced

schooling came late, but money held in trust for him since his mother's death enabled him to attend Phillips Andover Academy in Massachusetts during his early 20s, and his maternal uncle George Peabody, a leading international financier, paid for his study at Yale College during his late 20s. At Yale, which was especially strong in science, he studied under James D. Dana, the foremost American geologist in those years. He graduated with honors in 1860, earned a master of arts degree in 1862, and with his uncle's support studied abroad with leading German scientists. In 1866 his uncle's endowment of the Peabody Museum at Yale led to Marsh's appointment as curator and as the first professor of paleontology in the United States. Upon his uncle's death in 1869 Marsh received a substantial inheritance that enabled him to forgo a Yale salary until 1898 and thereby avoid the chore of teaching.

The fossil riches of the West were beginning to capture the public imagination, as were the evolutionary theories of Charles Darwin. Marsh caught the rising tide. In 1868 on his first trip west, his train stopped briefly at Antelope Station, Nebraska, where Marsh poked through the diggings of a nearby well and turned up a major find: the bones of a small primordial horse that proved to be a missing link in the evolution of the modern horse and therefore a crucial piece of evidence in support of Darwin's theory. Between 1870 and 1873 Marsh returned to the West four times with parties of Yale seniors. Thereafter, Marsh used his ample financial resources to send out scores of diggers in the field while he remained at Yale classifying their finds—30 freight-car loads in all. As paleontologist of the U.S. GEOLOGICAL SURVEY, 1882–92, he had federal money to support his collectors and the laboratory staff and artists at his museum. Darwin's chief apostle, Thomas Huxley, was delighted with Marsh's fossil parade of evolving horses and promoted Marsh's reputation in Europe. During his career Marsh published more than 270 papers and books, naming 496 fossil species. Awards and prizes attested to his worldwide reputation, and he served as president of the National Academy of Sciences from 1883 to 1895.

Marsh's chief rival was Edward Cope, a fiercely pugnacious Philadelphia Quaker. Marsh himself was stern, stocky, and aggressive. In 1871 Cope poached on what Marsh considered his own dinosaur-hunting preserves in Wyoming. Each man accused the other of unscrupulous tactics, and both were right. Their escalating war was marked by cloak-and-dagger secrecy and spying, false trails, subverting of each other's hired collectors, and public accusations of lying, theft of specimens, and false dating of papers. The struggle raged for two decades. With the weight of his money, connections, and towering reputation, Marsh prevailed. But the battle had stirred Cope into writing a mammoth compilation of his own researches that established him as one of the world's great naturalists. Marsh died on

March 18, 1899, and, never having married, bequeathed his estate to the Peabody Museum, the National Academy of Sciences, and Yale University.

**McKim, Charles Follen** See WHITE, STANFORD.

**McKinley, William** (1843–1901) *25th president of the United States*

Born in Niles, Ohio, on January 29, 1843, William McKinley attended Allegheny College and taught school before enlisting in the 23rd Ohio (RUTHERFORD B. HAYES's regiment) for the duration of the Civil War. His efficiency as a commissary sergeant at the Battle of Antietam made him an officer, and at the war's end he was a major. He then studied law and in 1867 began practicing in Canton, Ohio. There in 1871 he married Ida Saxon, to whom he remained devoted despite the onset of epilepsy and neurotic behavior following the loss of their two infant daughters. In 1876 he was elected as a Republican to CONGRESS and served from 1877 to 1883 and 1885 to 1891 (losing only in the Democratic landslide years of 1882 and 1890); he became the most conspicuous champion of protectionism and the author of the MCKINLEY TARIFF of 1890, which jacked up rates but also provided for the novel feature of reciprocal trade agreements.

McKinley shrewdly gave protectionism a plausible populist nationalistic spin, ascribing to it the prosperity of American workers and farmers by creating jobs and domestic markets. While usually successful, that argument was rejected on the national level by voters in 1890 and 1892, but it was again embraced by them following the panic of 1893 and it enhanced McKinley's reputation. He won the Ohio governorship in 1891 and 1893 and in 1896, aided by his political lieutenant, MARCUS ALONZO HANNA, easily won the Republican presidential nomination. Having rejected its incumbent president, GROVER CLEVELAND, the DEMOCRATIC PARTY, led by WILLIAM JENNINGS BRYAN, was discredited, demoralized, and divided by the

depression following the panic of 1893. Bryan wished to inflate the currency with the unlimited coinage of silver, while McKinley stressed that the gold standard and protection would promote prosperity and warned that an inflated dollar would destroy the real wages of workers. Both Bryan and McKinley spoke constantly, Bryan as he toured the country and McKinley as he stood on his front porch receiving hundreds of delegations. Hanna raised \$3.5–4 million for the campaign, while the Democrats had only one-seventh that amount to spend. McKinley triumphed decisively with 271 electoral votes to Bryan's 176.

McKinley was often underestimated by his contemporaries, and many historians have followed their lead. His amiable, pragmatic, and compromising nature—combined with his ability to maneuver unobtrusively while pursuing his goals—have masked his strength of character, his capacity to deal with Congress, and his domination of advisers. Indeed, JOHN HAY dismissed as “idiots” those who thought Hanna would “run” McKinley. He began his presidency by calling a special session of Congress to raise the tariff, and it obliged with the Dingley Tariff (1897). Far from doctrinaire on the monetary issue, McKinley favored international BIMETALLISM (basing currency on gold and silver), but when the British rejected that idea he signed the Gold Standard Act (1900).

War and empire, not the tariff and the currency, dominated the McKinley administration. In 1895 CUBA again revolted for its independence, and Spain soon resorted to harsh measures to preserve its colony. Outraged by newspaper accounts of Spanish atrocities, many Americans clamored for a war of liberation in Cuba. Using diplomacy and the threat of military intervention, McKinley secured some concessions from Spain, but when it would not free Cuba, he reluctantly asked for and received from Congress a declaration of war. The SPANISH-AMERICAN WAR (1898) was of short duration, and McKinley not only directed the war effort but also, to the dismay of the anti-imperialists, made the decisions that gave the United States Puerto Rico in the Caribbean and the Philippine Islands in the Pacific. Ironically, his administration suppressed the FILIPINO INSURRECTION against American rule using the same tactics that Spain had employed to put down the Cuban revolution, and Cuba, though nominally independent, was made an American protectorate. Increased Caribbean interests made an isthmian canal under American control an imperative objective of the McKinley administration, and in the Hay-Pauncefote Treaties (1900, 1901) with Great Britain, the Clayton-Bulwer Treaty (1850) was superseded and the United States could proceed unilaterally with a canal between the Atlantic and Pacific Oceans. After gaining possession of the Philippines, American interest in trading with China was heightened, which led to circulating the OPEN DOOR NOTES (1899, 1900) to oppose its dismem-

William McKinley (*Library of Congress*)

berment and the dispatching of troops to help suppress its Boxer Rebellion (1900). By enhancing the power and prestige of the presidency, McKinley was a forerunner of modern 20th-century chief executives. McKinley, for example, justified sending troops to China on the basis of his war powers even though there was no war.

McKinley was renominated in 1900, and, with a popular vice presidential running mate, Theodore Roosevelt, he triumphed for a second time over Bryan. But his plans for his second term to moderate the protective tariff through

reciprocity treaties were not realized. McKinley was shot by an assassin on September 6, 1901, in Buffalo, New York, and died on September 14.

**McMaster, John Bach** (1852–1932) *historian*

Historian of the people of the United States, John Bach McMaster was born on June 29, 1852, in Brooklyn, New York. He grew up in Manhattan, attending public schools and the New York Free Academy (now City College, of the City University of New York), where in 1872 he earned a B.A. He excelled in physics and chemistry, was good in English, but was only average in history, which at that time paid little attention to the United States and stressed facts about those who governed. Nevertheless, McMaster was interested in recent American history, possibly to understand the seemingly contradictory actions of his father, a native New Yorker who became in 1852 a slave-owning Louisiana sugar planter. Nine years later, having returned to the North, he took his son to the White House to shake hands with Abraham Lincoln. In the Free Academy library McMaster found Horace Greeley's *American Conflict* in which a reference to the Louisiana Purchase led him to read FRANCIS PARKMAN's *La Salle and the Discovery of the Great West*. Next he dipped into, but found disappointing, multivolumes on American history by George Bancroft and Richard Hildreth. They failed to carry the story beyond 1821 and concentrated on political, diplomatic, and military events rather than on the American people. Visiting an aunt after his graduation, McMaster chanced upon Thomas Babington Macaulay's *History of England from the Accession of James the Second*. In the first volume he was inspired by chapter 3 on "The State of England in 1685." Wondering whether he could be an American Macaulay, McMaster vowed, "I will."

But first McMaster had to make a living. From 1872 to 1873 he had an English fellowship at his alma mater and did little on his history beyond deciding to begin it with a description of the United States in 1784, patterned on Macaulay's description of England. McMaster worked from 1873 to 1874 as a civilian attached to the U.S. Army Corps of Engineers, surveying and mapping the Virginia battlefields of Winchester and Cedar Creek for the memoirs of General Philip Sheridan. The country was beautiful, but he found Winchester and its people filthy, Sheridan "hot-

tempered" and "ugly-faced," and much of his work dull. In 1874, when McMaster returned to New York from Chicago (where he had been at Sheridan's headquarters), the economy was dull following the panic of 1873. For the next three years McMaster lived with his mother and did some tutoring, while writing two technical engineering books (one on bridges and tunnels and the other on dams) for the *Van Nostrand Science Series*.

These technical books helped McMaster get appointed, in January 1877, assistant professor of engineering at the new John C. Green School of Science at Princeton, where he remained until 1883. Ignored by his colleagues and without a social life, McMaster was unhappy at Princeton. He was tired of teaching "lunk-heads," his immediate superior was a crank, and the president, James McCosh, bullied the faculty. By working on his history, McMaster found relief from his frustration, but he interrupted his writing in summer 1878 to lead postgraduate students on a fossil-hunting expedition to the Bad Lands of southeastern Wyoming. They found fossils, but a budding paleontologist, Henry F. Osborn, utilized their specimens in learned papers, far more than did McMaster, who was more interested in the social conditions of the West and its people, who were building a new land. Realizing he was a historian, rather than a scientist, McMaster, on his return, worked single-mindedly on the first volume, 1783 to 1789, of his *History of the People of the United States*.

McMaster believed that the "mingling" of economic, social, and political history would achieve "a correct understanding of the peculiar circumstances under which our nation was formed and grew up." To find material McMaster used newspapers, pamphlets, memoirs, and travel accounts far more than previous historians. Although he had limited funds, he worked extensively in the splendid newspaper collection of the American Antiquarian Society in Worcester, Massachusetts, the Library of Congress, and the historical societies of New York, New Jersey, and Pennsylvania. He completed volume 1 in 1881 and delivered it, a huge longhand manuscript, to D. Appleton & Co. Its editors hesitated to publish an unconventional history, written by a civil engineer, until Daniel Appleton, owner of the publishing house, discovered the manuscript was fascinating reading.

Published in 1883, it became an instant best seller. CHARLES ANDERSON DANA, editor of the *New York Sun*, was among the many who could not put it down, and while it marked a departure from their work, it was well received by leading historians including Bancroft and Hermann Von Holst. Because he did not stress wars and politics, McMaster's real heroes were the people, and his work was criticized for being unpatriotic. Critics also noted that in his desire to emulate Macaulay, he imitated him, borrowing, with only slight changes, his figures of speech to a point

called close to “theft” by the *New York Tribune* reviewer. That reviewer also demonstrated in parallel columns that McMaster had borrowed without attribution from William C. Rives’s *History of the Life and Times of James Madison*. Although ecstatic reviews outweighed criticisms, McMaster, whose work was based on an enormous amount of original research, was chagrined by his lapses and was more careful in the future.

The success of his work led to McMaster’s appointment as professor of history at the University of Pennsylvania, where he served from 1883 until he retired in 1920. Success also led to his marriage to Gertrude Stevenson, a longtime friend. They had three children. By 1913 McMaster had completed seven additional volumes, bringing his work up to the outbreak of the Civil War. In retirement he added a volume on the Lincoln administration. While working on his *History of the People*, McMaster wrote several other works, including *Benjamin Franklin as a Man of Letters* (1887) and *Daniel Webster* (1902). McMaster also profoundly influenced the teaching of American history through his textbooks on the primary and secondary levels, of which more than 2.5 million copies were sold. He was an associate editor of the *American Historical Review* (1895–99) and president of the American Historical Association (1905–06). He died on May 24, 1932, in Darien, Connecticut.

### meatpacking

The combination of the technologies of railroading and refrigeration resulted in the refrigerator car (reefer), introduced in 1870 but perfected in 1881, which in turn created the major industry of meatpacking. Prior to the Gilded Age, meatpacking utilized animals raised in the Midwest; was restricted to curing hams, salting pork (Cincinnati, the major center, was called “Porkopolis”), and some corning of beef; and could be done only in cold weather so as to retard spoilage. Fresh meat had to be butchered locally, and cities had their slaughterhouse districts. By 1870 the penetration of the West by railroads brought western cattle to packing centers like Chicago (its Union Stock Yards opened in 1865), and efficient reefers after 1881 enabled packers like Philip D. Armour and Gustavus F. Swift to aggressively market their dressed beef in eastern cities. To break down eastern consumer hostility against western beef, Swift established East Coast branches and refrigerated warehouses. Their success was such that shipments of dressed beef to urban centers replaced those of live animals to small slaughterhouses at those points. Most of the

nation’s butchers no longer butchered; instead, they cut up carcasses slaughtered hundreds of miles away. In the early 1890s six large-scale firms—Armour, Swift, Cudahy, Morris, Hammond, and the kosher meat dealer Schwartzchild & Sulzberger—dominated the meatpacking industry. The Big Six, following Swift’s leadership, were integrated companies with their own purchasing units, packing plants, refrigerator cars, and branch houses.

The Big Six preferred cooperation to competition and, with Swift and Armour leading out, created an informal pool in 1893 with weekly allocations designed to produce a profit for all. By 1902 this “Beef Trust” was, with the anti-trust movement underway, vulnerable. The Big Six managed, however, to continue their monopolistic practices that year when Armour, Swift, and Morris bought into the National Packing Company, which Hammond and some smaller companies had formed; although Cudahy and Schwartzchild & Sulzberger remained independent, they followed its leadership in pricing and production quotas. By 1910 the meatpackers had abandoned National Packing at the behest of the Justice Department, but the Big Six understood each other so well that without any formal arrangement they simply continued to follow the prices set by Swift and Armour.

### medicine and public health

American medicine and public health lagged behind European countries during the 19th century, in part because of the country’s largely rural character at the beginning of the period. Cities spread disease, and it was not until late in that century that population shifts transformed the United States into an urban nation (see CITIES AND URBAN LIFE). From 1870 to 1900 the United States made modest progress in the field of sanitation with the establishment of health agencies at the municipal level. Advances, however, were even more modest in medicine and surgery, and ailing Americans often resorted to patent medicines and tonics.

Until the 1890s, the most able American doctors were trained in Europe, particularly in Germany (see EDUCATION, HIGHER). Whereas gaining acceptance to medical schools in the 21st century is notoriously difficult, 19th-century American schools accepted most applicants for study. Moreover, American medical schools relied on lectures and provided little clinical training. An 1867 graduate of New York’s College of Physicians and Surgeons who received a prize for his thesis on the “Fatty Degeneration of the Liver” later criticized his training by noting that he had never seen a liver that had undergone fatty degeneration, nor had he

Label for Kentucky Tonic Bitters (Library of Congress)

seen a patient who had suffered from such a liver. Furthermore, medical schools sponsored virtually no research. Consequently, graduates were handicapped by having little hands-on experience and little knowledge of the emerging field of bacteriology, which was critical in understanding disease in urban centers. Although Joseph Lister first practiced antiseptic surgery in 1865 in England, for much of the Gilded Age doctors were ignorant of those procedures, with fatal consequences for many of their patients. For example, scrupulously clean conditions would have saved many women who died of puerperal (childbed) fever after giving birth. The first significant body of medical research was undertaken not by a school of medicine but by the U.S. Department of Agriculture, which enlisted Dr. Theobald Smith to study Texas cattle fever and resulted in Smith's discovery in 1891 of how ticks transmit disease; this finding played a key role in understanding diseases like malaria, typhus, and Lyme disease.

There were however, some attempts in the Gilded Age by medical schools to raise their standards. Recognizing that standards varied widely from state to state, leaders in the medical profession attempted to revise curricula at medical institutions, and some even advocated a national medical school supported by federal funding. Northwestern University in Illinois was the first to address curricular reform by instituting a three-year graded program as early as 1859. No other institution, however, followed their lead until 1871, when Harvard University began a three-year program, adding the prerequisite of an academic degree.

The University of Pennsylvania and Syracuse University improved their curricula in 1877, with Yale and the University of Michigan following suit in 1880. The University of Pennsylvania supplemented its medical education program by establishing its University Hospital, which provided on-site faculty-supervised clinical training. The founding of Johns Hopkins Medical School in 1893 (with clinical training at the Johns Hopkins Hospital) further raised the bar by patterning its medical education program after German universities and buttressing the curriculum with top-notch facilities, laboratories, and a large endowment to help fund medical research.

The Gilded Age also witnessed the early attempts to professionalize and improve American medicine. These efforts focused on self-policing by professional organizations and accreditation bureaus and, to a lesser extent, the establishment (and in some cases reestablishment) of state licensing boards. Toward the end of the century, the American Medical Association (AMA) attempted to create medical standards in the field of education that exceeded government regulations. An accrediting agency to ensure standards, the American Medical College Association (AMCA), was established in 1876 but was shortly disbanded after several colleges withdrew because of its stringent requirements. In 1890 the AMCA reorganized with more success, becoming the Association of American Medical Colleges; although it lacked licensing power, the body soon developed revised standards, including a three-year program, instruction in chemistry and pathology, and a graded curriculum. By the end of the century, most states had established medical licensing boards, and during the first years of the 20th century the AMCA, with a stronger AMA, had succeeded in closing down substandard medical programs. The rigorous reform of American medical schools occurred only after Abraham Flexner's damning 1910 report recommended closing 120 out of 155 medical schools in the United States and Canada.

American doctors were behind the curve in adopting and improving upon European advances in anesthesia and antiseptic surgical practices, although by the 1890s—especially after some improvement in medical education—American medicine began to catch up with Europe. In that decade the United States was home to several notable medical firsts, including the world's first open-heart surgery in 1893 and the first appendectomy in 1894. Some American doctors were instrumental in the field of anesthesiology as well, including Dr. William S. Halsted (1852–1922), who experimented with uses of cocaine, especially on himself (his self-administered injections contributed to a lifelong addiction to the drug).

In the area of public health, officials built on discoveries in Europe by focusing on eliminating infectious disease and safeguarding water systems. In the United States the

field of public health grew as a result of growing cities and their endemic unsanitary conditions. Early municipal health officials inspected sewer systems with the goal of providing clean living conditions in socially disadvantaged neighborhoods. In practice this was difficult; rudimentary sewer systems proved inadequate, and drinking water tended to be polluted in rapidly expanding cities. True reform in the area of public health—such as vaccinations, bathhouses, modern sewer systems, and slum clearance programs—would not come until the start of the 20th century. Efforts, however, were made: The founding of the American Public Health Association in 1872 signaled within the medical profession a new awareness of this specialized field, as municipalities and states began establishing boards of health; by 1900 most states had boards of health. The federal government tended to stay out of health issues, although CONGRESS passed a national quarantine law in 1893 to attempt to stop the spread of infectious diseases carried by immigrants from other countries.

## merchant marine

The merchant marine was one sector of the otherwise booming Gilded Age economy that was in decline. In the 1850s more than 70 percent of American exports and imports were shipped in American vessels, but by 1897 only 15 percent of the value of imports and 8 percent of the value of exports were carried by American ships. The decline began in 1863, during the Civil War, and steadily continued thereafter. By 1870 American ships totaling approximately 2.5 million tons entered and cleared American seaports, as compared with a tonnage for foreign vessels of about 3.8 million. By 1900 American tonnage entering and clearing U.S. seaports was 4 million, while foreign tonnage leaped to 19.6 million.

The most obvious reason for the decline is the Civil War, which is indeed when it first set in. Confederate raiders sank about 800,000 tons of American ships, which jacked up insurance rates and prompted owners to sell an even larger tonnage to foreigners to be operated under neutral flags. But in the past seafaring nations have suffered depredations to their commerce and have rebuilt their merchant marine in times of peace to reclaim their share of the carrying trade. The Civil War is partly responsible but probably not even the major reason for the long-term decline.

By the time of the Civil War technological innovations were fundamentally altering ships. Canvas sails and wooden vessels were being supplanted by steam engines in iron and later steel hulls. The change did not occur overnight because, where speed was not of critical importance, sailing vessels remained cost effective throughout the Gilded Age in shipping bulky goods like coal or timber. But as time went on, steam engines improved in efficiency, taking up less space, producing more power, and burning less coal; steel hulls provided more capacious holds; and the industrial world demanded celerity, punctuality, and predictability.

With an ample supply of timber, Americans had excelled in constructing wooden sailing ships. Their clipper ships of the 1850s were the fastest sailing vessels afloat. American shipbuilders were on the cutting edge of wood and sail, but not of iron and steam. During the Gilded Age American shipbuilders did build iron- and steel-hulled steamships, but their labor costs were significantly higher than those of British shipbuilders. The efficiency that made Americans preeminent as STEEL producers was absent in their shipyards, where vessels were not mass-produced. American shipowners did not buy foreign-built ships because by law only American-built ships could be registered as American. Not only were American ships more expensive to build than foreign vessels, but they also were more costly to operate. Lower costs for operators of foreign ships meant lower freight rates than those Americans charged and resulted in steadily increasing shipments in foreign bottoms.

The decline of the merchant marine rankled patriotic Americans, who sensed that “effeminacy” and “decadence” would surely follow. To reverse the trend CONGRESS provided subsidies in the form of lucrative mail contracts and in 1891 passed a Merchant Marine Act that gave bounties per mile on certain outward-bound routes. Subsidies, however, were ineffective in stemming the drift to shipping in foreign vessels, and Americans, who supported an indirect subsidy in the form of a protective tariff, were reluctant to provide significant direct support to the American shipowners.

**mining: metal and coal**

American mining production increased by a factor of five during the last 30 years of the 19th century. The discovery of new deposits in part drove the increase. In 1872 Jordan Nelson opened the first commercial coal mine in the rich Pocahontas, West Virginia, bituminous coal field. Gold was discovered in the Black Hills of Dakota in 1876. Copper mining began in the Tombstone, Arizona, district in 1879, and the Copper Queen mine opened near Bisbee, Arizona, the following year. The Coeur d'Alene silver-lead mining district of Idaho began operations in 1883, and the first shipment of iron ore from the Mesabi Range in Minnesota occurred in 1892.

Individual prospectors continued to discover new deposits. But government-sponsored geological surveys greatly expanded the fund of knowledge concerning the nation's mineral resources. In 1870, for example, Pennsylvania conducted a second geological survey that focused on petroleum and updated previous findings on coal. In 1879

the federal government established the U.S. GEOLOGICAL SURVEY as a permanent bureau in the Department of the Interior.

Mining consists of several distinct operations. The first is gaining access to the resource. Gold was often discovered in streams at "placers," or deposits laid bare by erosion or weathering. Placer mining was a simple operation of swirling material in a pan or a larger rocker until the heavier metal settled on the bottom. Other minerals were easily quarried at their outcrops or where they penetrated the surface. Open-pit mining extracted the resource by removing the overburden where deposits lay near the surface. By the 1890s steam-powered shovels working in open pits extracted anthracite coal in Pennsylvania and iron ore in Minnesota's Vermillion and Mesabi Ranges. Hydraulic mining used powerful water canons to uncover shallow deposits of gold and other precious metals.

Three types of entry gained access to deposits located deep below the surface: The shaft was a vertical hole sunk

Hydraulic mining at Rockerville, Dakota, 1889. Photograph by John C. H. Grabill (*Library of Congress*)

through rock strata to the deposit. A slope was an inclined plane following the strata's dip, while the drift was driven on an upward angle. Wherever possible, mine operators drove drifts and slopes through the mineral's seam or vein. Tunnels were driven horizontally from the side of a mountain to the deposit.

The second step in mining is freeing the material from the earth. At first, miners used hand-powered drills and augers to bore holes into the deposit, filled the holes with explosives, and then blasted the material free. Several technological changes improved productivity at this stage of mining. In western hard-rock mines, jackhammers powered by compressed air began to replace the hand augers in drilling rock in the 1870s. The use of undercutting and other mining machines were used in bituminous coal mining by the 1890s. Dynamite, invented in 1867, gradually replaced black powder as the explosive of choice.

The third procedure in the mining process, moving the freed material to the surface, consisted of loading and transporting. Although some mines utilized mechanical loading devices, hand loading, either by shovel or the manual adjustment of chutes, remained dominant circa 1900. At first, mules provided the motive power for hauling loaded cars through gangways. As early as 1867 anthracite mining companies experimented with small steam locomotives inside the mines. Although they proved cost effective, they created a pollution problem. In 1891 the Susquehanna Coal Company installed the industry's first compressed-air locomotive, which proved very effective, but it began to give way to electric locomotives by the turn of the century.

Mastery of the increasing technological complexity of mining required specialized knowledge. Columbia University established the nation's first School of Mines in 1864. Other institutions began offering mining engineering degrees. In 1871 both the formally educated and practically trained engineers formed the American Institute of Mining Engineers as a forum for the exchange of ideas and to enhance the status of their occupation. Most mining engineers, however, were content to become corporate bureaucrats rather than entrepreneurs.

Opening deep mines, keeping them dry and well ventilated, and procuring the latest technology required more capital than an individual could afford. As a result, the entrepreneurial order quickly gave way to corporate control in hard-rock as well as in coal mining. By 1914 the Guggenheim family, for example, had expanded their initial hard-rock holdings in Leadville, Colorado, into the greatest mining empire in the world, with facilities in the West, Mexico, Alaska, Chile, and the Congo extracting, smelting, and marketing copper, silver, gold, and lead. Corporate consolidation was also pronounced in the anthracite coal industry, where seven carrier-operators controlled 90 percent of the productive capacity.

**Minor v. Happersett** (1875) See WOMEN'S RIGHTS.

**Mitchell, Maria** (1818–1889) *astronomer*

Maria Mitchell, the first woman professor of astronomy in the United States, was born on August 1, 1818, into a Quaker family of 10 children on Nantucket Island in Massachusetts. Her father believed that girls, like boys, should be educated to the extent of their abilities. She was a precocious child and exhibited a special talent for arithmetic. Her father was interested in astronomy and navigation, and at the age of 14 she assisted him in his work of rating nautical chronometers.

Mitchell taught school briefly and then, beginning in 1836, served for 20 years as librarian of the Nantucket Atheneum. In that position she had enough free time to study mathematical and scientific treatises and to indulge with her father in their shared interest in astronomy. When, also in 1836, he became the cashier of the Pacific Bank in Nantucket, he installed a four-inch telescope in a small observatory on the roof of his family's living quarters adjoining the bank. Maria and her father used this telescope at night, making accurate stellar observations that attracted the attention of the Harvard College Observatory and the U.S. Coast Survey.

On October 1, 1847, Maria Mitchell discovered a comet (subsequently named for her) that could be seen only with a telescope. Her feat earned her an international reputation, and the king of Denmark awarded her a gold medal. In 1848 she became the first woman elected to the American Academy of Arts and Sciences in Boston (apparently the only woman until 1943, almost a century later). Appointed as a computer in 1849 for the *American Nautical Ephemeris and Almanac*, she did calculations on the positions of Venus. On the recommendation of Louis Agassiz, in 1850 she became the first woman voted into a membership in the American Association for the Advancement of Science. Having given up her librarianship, she toured Europe in 1857 to 1858 meeting distinguished scientists and visiting the Greenwich and Vatican Observatories.

Mitchell was both a feminist and a feminist heroine who was living proof that women were the intellectual equals of men. Consequently, she was interested in Matthew Vassar's

plans for a women's college in Poughkeepsie, New York, that would be comparable to the best men's colleges in the country. She accepted Vassar's invitation and joined the college in 1865 as its first woman professor, and although she had no higher education, she was the only faculty member with a national reputation. As a woman, however, she was paid less than her less distinguished male colleagues. Vassar baited his invitation with the promise, which he kept, of an observatory with a 12-inch telescope. Mitchell was a gifted teacher who imparted her love of astronomy to her students, as well as and also her distrust of authority and her love of independence. She disliked compulsory attendance of classes and of chapel. She believed in God and that God is good but rejected all dogma beyond that. She urged her students to question everything and to observe carefully for themselves, and several, including ELLEN SWALLOW RICHARDS, did achieve academic distinction. Mitchell also continued her research as an astronomer with the 12-inch telescope and contributed to the understanding of the nature of sunspots.

Mitchell leaned toward the moderate rather than the militant wing of the suffragists. She was a friend of LUCY STONE and invited her to speak on behalf of woman suffrage at Vassar. Mitchell was one of the founders in 1873 of the Association for the Advancement of Women, serving as its president from 1875 to 1876. After more than 20 years at Vassar, Mitchell, in poor health, retired in 1888 and died on June 28, 1889, in Lynn, Massachusetts.

### Molly Maguires (ca. 1855–1877)

Benjamin Bannan, Whig editor of the Pottsville, Pennsylvania, *Miners' Journal*, established the notion that a secret Irish society operated in Schuylkill County's anthracite coal fields during the 1850s. Hoping to drive a wedge between Irish and German Democrats, he editorially attacked the Irish as an ignorant group of drunkards whose behavior was easily manipulated. He alleged that a secret society, aligned with the "liquor interests," controlled Irish votes for insidious and criminal purposes. Later, he identified this secret society as the Molly Maguires, implying that they were the offshoot of a violent antilandlord society of the same name that operated in Ireland during the 1840s.

Violent protests against the Civil War gave some credence to Bannan's anti-Irish tirades. In July 1862, for example, John Kehoe, an Irish antiwar Democrat, spit upon the American flag during a public meeting in Audenried, Pennsylvania. F. W. Langdon admonished Kehoe and later

was found so badly beaten that he died the next day. The following month a large group of men stopped a train of draftees so those who wished to do so could go home. Bannan, now a Republican, was quick to note that these outrages occurred in areas heavily populated by Irish.

But Bannan was not the only person speaking about a secret criminal society. A serious crime wave, including more than 50 murders, broke out in Schuylkill County during the war, and most of the murders were unpunished. The county's district attorney, Franklin B. Gowen, blamed his failure to prosecute on a secret society that could produce alibis at will. Gowen did not name the secret society, but everyone understood that it was the Molly Maguires. After the Civil War, however, rumors of a criminal society in Schuylkill County receded.

Gowen resurrected the notion in 1871. Appearing before a legislative committee investigating a strike of coal miners, Gowen, now president of the Philadelphia & Reading Railroad, implied that a secret society killed anyone who disobeyed the union's strike call. Two years later he hired the Pinkerton Detective Agency to investigate the alleged secret society. The agency sent five operatives into the coal fields. Four infiltrated the union (the Workingmen's Benevolent Association), but they failed to link it with a criminal society.

The fifth detective, James McParlan, tried the Irish connection. He infiltrated the Ancient Order of Hibernians (AOH), a secret, benevolent fraternal organization, which he stated in a preliminary research paper was the American branch of the infamous Molly Maguires of Ireland. Although he uncovered two other criminal groups in his initial investigation, McParlan remained focused upon the AOH. He soon learned that there was indeed a secret inner terrorist circle within the secret AOH. According to him, the AOH lodge's bodymaster heard grievances and (without the knowledge of the lodge as a whole) arranged a proper retaliation, be it a beating or a killing, by securing men from a different community. As the level of violence increased, McParlan gathered information on several incidents, resulting in the arrest a number of AOH members.

During the "great Molly Maguire trials" in 1876, the prosecution not only tried to convict individuals but also the entire AOH by telling juries that membership in that society alone was sufficient evidence for conviction. Furthermore, the AOH was connected to Civil War violence when John Kehoe, an AOH bodymaster, was tried for the murder of F. W. Langdon. Although 14 years had passed since the crime was committed, the prosecution discovered witnesses to the event. Despite their conflicting testimony, Kehoe was found guilty and was hanged. Indeed, a total of 20 so-called Molly Maguires were executed.

The evidence supporting the existence of the Molly Maguires—McParlan's testimony corroborated by wit-

nesses granted immunity—is suspect. McParlan began his investigation with a preconceived notion of the Molly Maguires that he then applied to the bodymasters of the AOH. That is not to say that the murders he investigated did not occur or that all of the executed were innocent. But it is doubtful that the well-organized, violent, secret criminal society that McParlan described actually existed. It is more likely, given the motives for murder, that McParlan stumbled upon a loose-knit group of men acting out the agrarian tradition of retributive justice.

The Molly Maguire trials, however, gave credence to Benjamin Bannan's fulminations about the Irish and to Franklin B. Gowen's false innuendoes that Molly Maguire terrorists dominated the Workingmen's Benevolent Association, which in turn convinced many that organized labor was both violent and criminal. Ironically, many still believe Gowen's innuendoes and perversely applaud mythic Molly Maguires as martyrs of the labor movement.

**monetary policies** See CURRENCY ISSUE.

**Moody, Dwight Lyman** (1837–1899) *evangelical revivalist*

Few people so characterize their age and time as did Dwight Lyman Moody. Born on February 5, 1837, in Northfield, in rural Massachusetts, he went to Boston at age 17 to work as a salesman in his uncle's shoe business with the equivalent of a fifth-grade education. Two years later Moody experienced a religious conversion and awakening (he had joined the Boston Young Mens Christian Association [YMCA]) and soon thereafter moved to the then-rowdy and uncertain Chicago. Again working as a shoe salesman he also "sold" religion and filled the four pews he rented at Plymouth Congregational Church. His interests, however, were not narrowly denominational, and, besides working for the YMCA, he established in 1859 the North Market Sabbath School, which recruited its students from surrounding slums. To fund this burgeoning "congregation," he recruited men of wealth, including George Armour, Cyrus McCormick, and especially Charles Farwell, a rich merchant.

Although successful, Moody gave up secular business in 1860 to devote himself entirely to his urban missionary activities. During the Civil War he served in the United States Christian Commission ministering to Union soldiers, but between trips to the front, he worked in Chicago and in 1863 established a nondenominational church for his

Sunday school congregation. He became president of the Chicago YMCA in 1866, and, thanks to his zeal, he was renowned as a "circuit rider in the urban wilderness."

After the Chicago Fire of 1871 destroyed both his church and the YMCA building, Moody decided to become an evangelist. He had visited and preached in England in 1867 and in 1872, and when invited back in 1873 he launched a two-year evangelist campaign there. He took with him Ira Sankey, whose musical gifts had already augmented his preaching in Chicago. The response to Moody and Sankey in Britain was tremendous, and Moody remained a full-time evangelist. Although a religious conservative who believed literally in the Bible and that Christ would come again, Moody was a layman neither trained nor interested in theology or doctrines. Rather, he stressed "God's love for sinners," which appealed to and reassured his listeners in a period of industrial and urban change. Returning to America, Moody and Sankey held equally successful meetings in cities from Brooklyn to San Francisco from 1875 to 1881.

Moody and Sankey reinvented the religious revival, taking it from its antebellum style and substance into

Dwight Lyman Moody (Library of Congress)

the urban industrial age. With the skills and cunning of a salesman, with fresh and singable sentimental hymns, and with a message of divine love and salvation, Moody brought hope and comfort to millions and changed lives for the better. Moody was attuned to the individualism of his time, telling converts to join a church not of his but of their choice and to do good because it is the consequence of an inward, personal faith. Despite his meager education and conservative religious outlook (the term *fundamentalism* was not used during his lifetime), he numbered university professors, religious liberals, and ecumenically minded clergymen among his friends and supporters. When Moody died on December 22, 1899, he had become a major influence on the popular culture and spirituality of American Protestantism.

### **Morgan, John Pierpont** (1837–1913) *financier*

J. P. Morgan was the preeminent banker of the Gilded Age. Born on April 17, 1837, in Hartford, Connecticut, the son of international banker Junius Spencer Morgan and Juliet Pierpont, daughter of a Unitarian minister, John Pierpont, Morgan was educated at public schools in Hartford and Boston. Upon graduating from high school in 1854, he went on to study in Europe. In 1857, when his father relocated in London, he began his career in finance with Duncan, Sherman & Company in New York and in 1861 established his own private bank, J. P. Morgan & Company, becoming his father's agent in New York. During the Civil War he avoided conscription in the Union army by hiring a substitute and profited by speculating in gold and by purchasing defective carbines from the War Department and reselling them to the government at a high profit. His father reined him in by pairing him in 1864 with Charles Dabney in Dabney, Morgan & Company, and in 1871 (again at his father's urging) Morgan merged with Philadelphia's Drexel & Company to form Drexel, Morgan & Company. In 1895, after the death of Anthony Drexel in 1893, the firm became J. P. Morgan & Company. From the start Morgan was the leading spirit in these firms.

Morgan's main business was underwriting (selling) new issues of bonds and stocks of RAILROADS and other enterprises. Since railroads and industry were expanding rapidly and in constant need of capital, they were compelled to listen to Morgan who, to protect the investments of his clients, sought to eliminate wild speculation and cutthroat competition. As a result, Morgan emerged as the major force in organizing, integrating, and stabiliz-

John Pierpont Morgan (Library of Congress)

ing American railroads and industry in the Gilded Age. In the early 1880s, for example, the New York Central (NYC)—in which Morgan was deeply interested—and the Pennsylvania Railroad (PRR) engaged in rate wars and invasions of each other's territory. The PRR backed the construction of the West Shore line up the Hudson opposite the NYC's main line, while the NYC was constructing the South Pennsylvania paralleling the PRR's main line. In July 1885 Morgan invited representatives of the PRR and the NYC to meet with him on board his yacht the *Corsair* on the Hudson River. With his guidance the railroads agreed to cease their rate wars: The NYC got the West Shore line and the PRR received the South Penn, which it abandoned. (A half century later the Pennsylvania Turnpike utilized the South Penn's route and tunnels.) Neither the PRR nor the NYC reneged on their agreement, since Morgan could punish them by making their future financing difficult.

In the 1880s and 1890s Morgan reorganized many bankrupt railroads (including the Reading, the Chesapeake & Ohio, the Southern, and the Erie) and saw to it

that dependable allies would sit on their boards of directors and vote against rate wars and overbuilding, which so often had caused their failures. Morgan came to dominate a vast transportation network with more than 55,000 miles of rail, but he had no influence over the systems of both JAY GOULD (whom he never trusted) and Edward H. Harriman (who reminded him of Gould). Harriman was backed by Jacob Schiff of Kuhn, Loeb, & Company. Morgan and his ally JAMES J. HILL clashed in 1901 with Harriman over control of the Chicago, Burlington & Quincy (CB&Q), which connected Chicago to both St. Paul, Minnesota, and Omaha, Nebraska. Hill and Morgan controlled the Great Northern (GN) and the Northern Pacific (NP), which came no further east than St. Paul, while Harriman controlled the Southern Pacific and the Union Pacific, which got no closer to Chicago than Omaha. Their struggle panicked Wall Street, but Morgan and Schiff caught themselves and compromised, with Harriman getting a share in the management of the CB&Q. The deal was solidified by establishing the Northern Securities Corporation, which owned the GN, NP, and CB&Q. To Morgan's disgust it was dissolved by the Supreme Court in 1904, but a community of interest had been established.

As industrial corporations began to dominate the American economy in the 1890s, J.P. Morgan & Co. became a leader in their consolidation and reorganization, financing many of the country's greatest industrial developments. In 1892 Morgan financed the organization of General Electric, and in the following years he financed American Telephone and Telegraph (AT&T) and International Harvester. Morgan's greatest merger occurred in 1901, when he merged ANDREW CARNEGIE's steel company with other firms in the STEEL industry to form the first billion-dollar corporation, United States Steel ("Big Steel").

In his later years Morgan collected art and rare books as compulsively as he had collected railroads, accumulating by the time of his death what was estimated as the largest private collection of paintings, sculpture, manuscripts, and jewelry in history. He became the president of the Metropolitan Museum of Art in New York, to which he left the bulk of his collection of art, and his personal library was made public after his death. He was also a major benefactor of the New York Public Library and the Cathedral of St. John the Divine. Morgan took a strong public stand for moral rectitude and assisted ANTHONY COMSTOCK in establishing the New York Society for the Suppression of Vice in 1873. Nevertheless, though married in 1865 to Frances Louisa Tracy, with whom he had four children, he had a mistress and was widely criticized for marital infidelity.

For the last 20 years of his life, Morgan was the most powerful financial figure in America. Indeed, his power was so great that during two notable crises presidents fol-

lowed his lead and enabled Morgan to play a statesmanlike role for a price. In 1895 GROVER CLEVELAND was failing in his efforts to keep the nation on the gold standard as its gold reserves dwindled. Morgan, however, organized a loan to the federal government of \$62 million in gold, which restored confidence, stanching the outflow of gold from the treasury, saved the gold standard, and netted his firm a \$295,000 profit. In 1907, in the absence of a central bank, Morgan's arbitrary and effective actions (for which he was harshly criticized) reduced the effect of the Panic of 1907, but he used that crisis to extract from the TRUST-busting Theodore Roosevelt approval of United States Steel's acquisition of Tennessee Coal, Iron, & Railroad Company, which under normal circumstances Roosevelt never would have agreed to. Morgan was not the richest man in America, but his influence exceeded that of men like John D. Rockefeller and Andrew Carnegie, who were far wealthier than he. Morgan died on March 31, 1913, in Rome.

### Mormon Church (Church of Jesus Christ of Latter-day Saints)

The Mormon Church, founded by Joseph Smith (1805–44) in 1830, is unique and entirely American. Smith said he translated the *Book of Mormon* (1830), which he claimed was the sacred record of North American contemporaries among whom Jesus lived and taught following the Resurrection. Regarded as a prophet, Smith rapidly gained adherents who sought the purity of early Christianity. They coalesced about him but were persecuted and hounded from place to place as much for their formidable presence as for their beliefs. In 1841 Smith embraced the shocking doctrine of eternal marriage, which included polygamy. In 1844 he announced his candidacy for the presidency and later that year was lynched at Carthage, Illinois. Led by Brigham Young (1801–77), the Mormons fled west to build their Zion; they prospered in the valley of the Great Salt Lake. Politically, their Zion (Utah) was a theocracy, with Young at its head. Its economy was mixed, with families working their plots of land, herds communally owned, and milling, mining, transporting, banking, and merchandizing enterprises owned by the Mormon Church.

Mormon theocracy and polygamy caused problems with the federal government. The Mormons applied for

statehood in 1849, but Congress in 1850 created the Utah Territory and President Millard Fillmore appointed Young as governor. Other federal appointees, however, were hostile to the politically powerful and economically dominant Mormon Church, and in 1857 President James Buchanan replaced Young as governor and dispatched troops to uphold federal authority. Fearing that the army was bent on destroying their Zion, Young resisted and the Mormon militia destroyed supplies for the troops. The hysteria led Mormons to join Paiute Indians in the September 7, 1857, massacre of 120 Arkansas and Missouri migrants (sparing 17 children) at Mountain Meadows in southern Utah. By June 1858 the “Utah War” ended. Young did not want to fight the U.S. Army, and Buchanan promised amnesty if Young and the Mormons submitted to federal authority. Although Young was no longer governor, he remained, as head of the church, the dominant political force in Utah.

The federal government, however, gradually increased pressure on the Mormons. CONGRESS in 1862 passed a law banning polygamy that in 1879 was upheld by the SUPREME COURT. Although there were more arrests for polygamy following the Edmunds Act of 1882, the Mormon Church did not give up the practice until 1890, after the Supreme Court upheld the 1887 Edmunds-Tucker Act, which threatened Mormon institutions by dissolving the church as a corporate entity. With the Mormon Church no longer sanctioning polygamy, Utah became a state in 1896. The communitarian aspect of Mormonism gave way to the vigorous individualism of America at large. Perhaps the largest dissenting Euro-American social order in the 19th century, Mormonism in the 20th century ironically became a bastion for conservative American cultural values.

### mugwumps (1884)

The mugwumps, Republican advocates of CIVIL SERVICE REFORM, were distressed when their party, at its 1884 national convention, nominated JAMES G. BLAINE for the presidency. Blaine was not only hostile to their pet reform but also favored a protective tariff, IMPERIALISM, and worst of all was a corruptionist. (Years before, when serv-

ing as Speaker of the House of Representatives, he sold to the Union Pacific Railroad—which was anxious to retain his friendship—some nearly worthless Little Rock & Fort Smith Railroad bonds for \$64,000). When the Democrats nominated the anti-TAMMANY HALL governor of New York, GROVER CLEVELAND, many reform Republicans, including former Secretary of the Interior CARL SCHURZ and editors EDWIN L. GODKIN and George William Curtis, bolted and supported Cleveland. Loyal Republicans derisively called them mugwumps—apparently Algonquian for “great men”—since the bolters unabashedly thought of themselves as “the best men.”

The mugwump defection was disastrous for Blaine. It was especially strong in New York, and Blaine lost that state and therefore the election by a handful of votes. If 600 New York mugwumps had voted for Blaine instead of for Cleveland, Blaine would have been elected.

While the term *mugwumps* has particular relevance for the election of 1884, those men so-labeled had behaved independently in the past and would do so in the future. Several of them, including Schurz and Godkin, had participated in establishing the 1872 LIBERAL REPUBLICAN PARTY in opposition to President Ulysses S. Grant. Cleveland as president pleased mugwumps by his support of civil service reform and by trying to reduce tariff rates, and most of them supported him for president again in 1888 and in 1892. But they revered the gold standard and abhorred Free Silver (see FREE SILVER MOVEMENT), and in 1896 they voted for Republican WILLIAM MCKINLEY and against the Democrat WILLIAM JENNINGS BRYAN. The mugwumps, however, were anti-imperialists, and in the twilight of their careers opposed the acquisition of the Philippines by the McKinley administration.

### Muir, John (1838–1914) *naturalist, conservationist*

John Muir was the leading naturalist and conservationist in the Gilded Age. Born on April 28, 1838, in Dunbar, Scotland, Muir migrated with his family to Wisconsin in 1849. His father worked him unmercifully hard on the family farm, stunting his growth (so Muir thought) but also developing his phenomenal capacity for endurance. Early each morning Muir read whatever books he could get hold of, since his father forbade reading in the evening. In addition, Muir was a talented whittler, had a creative mind, and fashioned mechanical contrivances, including an ingenious clock that woke him up early to do his reading. He exhibited his inventions in 1860 at the State Fair at Madison, and, impressed by their quality plus his general knowledge,

John Muir (Library of Congress)

the University of Wisconsin admitted Muir. Limiting his studies to subjects that interested him—chemistry, geology, and botany—Muir left in 1863 without earning a degree and began taking walking tours that became the passion of his life. Tramping through Wisconsin, Iowa, Illinois, Indiana, and into Canada, Muir kept journals recording and picturing what he had seen each day. Later, he would draw upon these records for his writings.

In 1867, while working in a wagon factory in Indianapolis, Muir injured an eye and “bid adieu to mechanical inventions” to study “the inventions of God.” He walked 1,000 miles from Indianapolis to Florida and then went to California in 1868 and walked from San Francisco to the Yosemite Valley, where he lived for the next six years. While there he concluded that it had been shaped by eons of glacial activity, thus earning the derision of both California State geologist Josiah D. Whitney and the future head of the U.S. GEOLOGICAL SURVEY, CLARENCE KING; ultimately, though, Muir’s views and not their ideas were accepted by geologists. Muir also explored Nevada, Utah,

and the Pacific Northwest before marrying in 1880 Louie Wanda Strenzel, the daughter of a Polish patriot who fled Poland after the abortive Revolution of 1830, settled in Martinez, California, in 1849, and became a leading horticulturist. After visiting Alaska in 1881 (where he discovered and described glaciers, one of which is named for him), Muir purchased a portion of his father-in-law’s land, lavished his attention upon it, and, like his father-in-law, became an outstanding horticulturist. By 1891—having sold or leased his land—Muir was able to pursue his avocation as a naturalist and conservationist.

Muir had contributed numerous articles on the natural beauty of the West to *Scribner’s Monthly* and to the *Century Magazine*. He took Robert Underwood Johnson, the *Century* editor, on a camping trip in the Yosemite region, showing him its grandeur and the damage wrought by grazing sheep (“hooved locusts” Muir called them). Together they launched a campaign to create Yosemite National Park. Muir’s earlier articles had aroused considerable interest in preserving beautiful areas, and, with popular sup-

port quickly building, CONGRESS in October 1890 created YOSEMITE NATIONAL PARK. The following year Congress empowered the president to create forest reserves, and in 1896 a Forestry Commission was created. Muir accompanied it on its investigative tour, and GROVER CLEVELAND in the waning days of his administration set aside 13 forest reservations. Lumber interests, however, succeeded by 1898 in undoing all but those in California. Muir wrote impassioned articles, again aroused public opinion, and the forest lands were reserved anew. In this work Muir was aided by the SIERRA CLUB, which he founded in 1892 and which has since become the leading advocacy group for the CONSERVATION of resources and the preservation of nature. With the presidency of Theodore Roosevelt, whom Muir in 1903 took camping in Yosemite, conservation had a warm friend in the White House. Roosevelt added 148 million acres to forest reservations and created 16 national monuments (including Muir Woods) and national parks (including Sequoia National Park). Muir, however, lost his last battle to prevent the flooding of Yosemite's Hetch Hetchy Valley for a San Francisco reservoir. He died in Los Angeles on December 24, 1914.

## music: art, folk, popular

### Art Music

The years following the Civil War saw the emergence of a national identity in the United States. One aspect of this was the gradual emergence of an American artistic identity. In the case of art music, there was a sense that America should develop a musical life of a quality equal to that of the European nations. William Mason (1829–1908)—pianist, composer, and the son of Lowell Mason—spoke for many of his generation and class when he encouraged the cultivation of refined musical taste in America. The 19th century saw the establishment of New York, Boston, and Philadelphia as the primary American cultural centers, but the arts were gaining a foothold in growing cities throughout the country. Symphony orchestras, choral societies, and other musical organizations were founded in many American cities.

In the first half of the century, organizations such as the Handel and Haydn Society in Boston (1815) and the

New York Philharmonic Society (1842) were semiprofessional, offering individual concerts or a short season. The late 19th century saw the founding of professional organizations in many cities, including the New York Symphony Orchestra (1878), the Boston Symphony Orchestra (1881), the Chicago Symphony (1891), the Cincinnati Symphony Orchestra (1895), and the Philadelphia Orchestra (1900). Theodore Thomas (1835–1905), a German-born violinist, was the most influential conductor and promoter of symphonic music. In 1865 he founded the Theodore Thomas Orchestra, a New York-based organization that set a standard of excellence in orchestral music and was rivaled only by the finest European orchestras. Thomas also brought distinction to other orchestras he served as director, including the Brooklyn Philharmonic, the New York Philharmonic, and from 1891 until his death, the Chicago Symphony Orchestra.

Art music in the second half of the 19th century was dominated by a group of composers known as the “Boston classicists,” or the second New England school (the first being William Billings and the “singing school” composers of the 18th and early 19th centuries). Most of the representatives of this school studied in Germany and considered the music of Haydn, Beethoven, and other German masters as models. Their approach to composition was academic and, indeed, as it was not possible to earn a living as a composer, many of them held appointments at recently founded conservatories and universities that were establishing music departments.

John Knowles Paine (1839–1906) could be considered the “father” of the New England school. Paine was born in Portland, Maine, studied organ and composition in Berlin, and was the first professor of music at Harvard. His orchestral works were highly regarded in his lifetime and received frequent performances. George W. Chadwick (1854–1931) was a composer whose orchestral music marked the beginning of an American style. Born in Lowell, Massachusetts, he studied at the New England Conservatory and in Germany with Josef Rheinberger. He taught at the New England Conservatory from 1882 until shortly before his death. Chadwick's orchestral style was firmly rooted in German romanticism and demonstrated colorful orchestration, yet was also marked by a distinctly American “tunefulness” and accessibility. It could be said that American orchestral composers of the 20th century, from Hollywood composers working in the 1930s to composers such as Aaron Copland, were his artistic descendants.

AMY MARCY CHENEY BEACH (Mrs. H. H. A. Beach) was the first important American woman composer and one of the finest composers of the second New England school. Born in Henniker, New Hampshire, Beach was mostly self-taught as a composer, in part because opportunities for formal study were not available to women. Beach was

an internationally acclaimed concert pianist, and her compositions included chamber music, songs, many works for piano, and a small number of significant orchestral works.

EDWARD MACDOWELL (1860–1908) was the most celebrated composer of this generation. Although he was born in New York and lived much of his life there, he lived and worked in Boston from 1888 to 1896 and shared many characteristics with his New England contemporaries. His formative years of study were spent in Germany, and his work is within the German romantic tradition. He was professor of music at Columbia University from 1896 to 1904, and he was hailed in his lifetime, both in the United States and Europe, as the first great American composer. Other important members of the second New England school included Arthur Foote (1853–1937), organist at the First Unitarian Church of Boston, and Horatio Parker (1863–1919), professor of music at Yale University. Charles Martin Loeffler (1861–1935), assistant conductor of the Boston Symphony Orchestra for more than 20 years, was born in Alsace but lived most of his life in Medfield, near Boston. He studied in Paris and was the first American composer whose music exhibited the influence of French impressionism more than German romanticism. Dudley Buck (1839–1909), a contemporary of Paine, was one of the leading organists, choral directors, and composers of sacred music. He held positions in Hartford, New York, Chicago, and Boston.

In 1892 Antonín Dvořák came to the United States to serve as director of the National Conservatory of Music in New York. He encouraged American composers to make use of American folk music as source material for their compositions, as he had done with Bohemian folk music in his own compositions. He especially encouraged the use of American Indian music, as he felt this was the true indigenous music of America, and African-American music, which he found very beautiful and thoroughly American. His Symphony No. 9 (*From the New World*) employs themes inspired by African-American melodies. Many leading composers, including Chadwick, MacDowell, and Beach, did use folk melodies in their compositions. Arthur Farwell (1872–1952) was a leader of the “Indianist” movement. He made extensive use of NATIVE AMERICAN themes in his compositions and in 1901 founded the Wa-Wan Press, which published arrangements and compositions by some 37 composers based on Native American music.

### Folk Music

One result of the growing appreciation of American culture was the first serious studies of Native American music. In 1882 Theodore Baker (1851–1934), an American music historian, published the first scholarly study of Native American music, *Über die Musik der Nordamerikanischen Wilden* (*On the Music of the North American*

*Indians*), as his doctoral dissertation at Leipzig University. It was from this work that MacDowell drew his themes for his *Indian Suite*, op. 48. The works of Alice Fletcher (1838–1923) and, later, Frances Densmore (1867–1957) were not only of great importance in the field of Indian studies but were pioneering in the field of ethnomusicology. Fletcher, an anthropologist and ethnologist, published *A Study of Omaha Indian Music* (1893), *Indian Story and Songs* (1900), and *Indian Games and Dances with Native Songs* (1915). Densmore, who studied composition and piano at Oberlin Conservatory and was strongly influenced by Fletcher, did landmark studies of the music of the Chipewewa and tribes of the Plains and the Southwest.

Africans brought to the New World as slaves between the 17th and 19th centuries brought with them music and dance traditions that were an integral part of their lives. In the isolation of the plantations, many elements of these traditions were preserved for generations. Yet as the slaves were exposed to Anglo-Saxon Protestant society and its music, they gradually incorporated elements of that music into their own. By the beginning of the 19th century, a distinctive African-American music had formed. The music was communal and functional, and it included religious songs, work songs, and various types of recreational or play songs. *Slave Songs of the United States* (1867) was the first published collection of African-American folk songs. It was the work of three Northern antislavery activists, William Francis Allen, Charles Pickard Ware, and Lucy McKim Garrison, and contained mostly sacred music. The compilers describe different varieties of sacred songs, including the “shout,” a type of ring dance accompanied by largely improvisational singing, and the “spirituals,” which were more closely related to Protestant hymns. In the late 1860s, George L. White organized a small choir at Fisk University, a school for AFRICAN AMERICANS in Nashville, Tennessee. The repertoire of this choir consisted mostly of arrangements of African-American spirituals. In 1871 White took the choir on tour to raise money for the school. After attracting the support of HENRY WARD BEECHER in Brooklyn, New York, the Fisk University Jubilee Singers became an international sensation, concertizing widely in the United States and Europe. After severing connection with the university in 1878 and becoming an independent organization, the Jubilee Singers spent more than six years touring the world, including India, China, Japan, and Australia. The choir can be credited with introducing the world to African-American sacred music.

Following the end of the Civil War, substantial African-American communities were established in the South, and in these communities there evolved forms of African-American secular music that would have a profound influence on American music of the 20th century. The “blues,” a form that probably originated in the Mississippi Delta,

A man plays the fiddle while a family dances in this lithograph by James Queen, 1872. (*Library of Congress*)

traces its ancestry to the work songs and “hollers” of the slaves. But where that music was communal, the blues was personal. Each singer expressed his or her own personal sorrow, pain, and joy in song. The blues was characterized by use of a “blues scale,” which included a flattened third and seventh degree. Blues often involved an exchange between voice and instruments, typically banjo and guitar. Gradually, a strophic form evolved, which typically employed a 12-bar chord progression (tonic: four bars, subdominant: two bars, tonic: two bars, dominant: one bar, subdominant: one bar, tonic: two bars). The verse often consisted of a line of text that was repeated and then followed by a third line that answered and rhymed with the first two lines. New Orleans has been considered the birthplace of jazz. It is thought that the style had its origins in the music played by dance bands and marching bands formed for parades and funeral processions. Although the term *jazz* was not used until after 1910, these ensembles were developing a new

style of music that featured syncopation and improvisation by the 1890s.

The predominant culture in the eastern United States was of British origin, and much “American” folk music has British roots. The 19th century saw the arrival of millions of European immigrants who brought with them the music of their homelands. European musical traditions were preserved in many immigrant communities. Irish communities in Chicago and Boston, Jewish and Italian communities in the Middle Atlantic states, German and Scandinavian in the Midwest, Slavic and Polish in Pennsylvania, all preserved music of their homelands and contributed elements to American popular music.

### ***Popular Music***

American popular music between the end of the Civil War and the turn of the 20th century traces its inspiration and origins to a variety of sources. British broadside ballads and

folk songs, Irish and Scottish songs, melodies from Italian opera, and the hybrid music of the immensely popular blackface minstrel shows were all parts of antebellum popular song style. This style found its culmination in the songs written by Stephen Foster between 1844 and 1864, and the style of Foster was to profoundly influence all future American popular songs. Postwar popular music saw the increasing influence of German musicians and music, from the songs of Franz Schubert to melodies from the musical dramas of Richard Wagner. Yet in many ways, postwar popular songs seemed to try to recapture a perceived naivete and innocence of prewar society, and many of the most popular were simple, sentimental songs that expressed a longing for the past.

"Silver Threads among the Gold" (1873) by Hart Pease Danks, "Grandfather's Clock" (1876) by Henry Clay Work, "I'll Take You Home Again, Kathleen" (1876) by Thomas Paine Westendorf, and "Carry Me Back to Old Virginny" (1878) by James Bland were typical of their day and reveal a stylistic debt to Foster. One new trend in American popular music was the publication of songs of the American West, such as "Home on the Range" (1876). The evangelical revivalist movement of the 1860s and 1870s produced a new style of "gospel" hymnody. Ira Sankey, Philip P. Bliss, Robert Lowry, and others wrote hymns that shared much in style with the popular music of the day. Lowry's "Beautiful River" and Joseph P. Webster and S. Fillmore Bennett's "Sweet By and By" are well-known examples of this genre.

The postwar years saw the rise of musical theater and the emergence of New York City as its most important center. In 1866 *The Black Crook* was produced in New York. The show incorporated a troupe of 100 French female dancers in a melodrama about a man who made a pact with the devil. This musical extravaganza, which combined sex appeal, elaborate stage effects, and popular music, had a run of 16 months and enjoyed frequent revivals through the turn of the century. Its success encouraged other extravaganzas such as *Humpty Dumpty* (1868) and *Evangeline* (1874), a parody of Longfellow's poem that was billed as a "musical comedy."

In 1878 Gilbert and Sullivan's *H.M.S. Pinafore* received its first American performance in New York in a pirated edition, and in 1879 Gilbert came to America to direct the first authorized performances. The operettas of Gilbert and Sullivan were enormously successful, and soon comic operas and operettas were in vogue in New York. French and Viennese operettas were produced, and American composers tried to duplicate the success of Gilbert and Sullivan. VICTOR AUGUST HERBERT, an Irish-born and Viennese-trained composer, arrived in the United States in 1886. His operettas, based on Viennese models but incorporating many American influences, were enormously popular from the 1890s through World War I. JOHN PHILIP

SOUSA composed and produced several operettas in the 1880s, but he had his greatest theatrical successes with *El Capitan* (1895), *The Bride Elect* (1897), and *The Charlatan* (1898).

The 1870s saw the beginnings of vaudeville, a new form of entertainment that would enjoy great popularity for the next 50 years. Vaudeville had its roots in the blackface minstrel shows, which had been a leading form of entertainment earlier in the century. However, the vaudeville of the 1870s was conceived as a more respectable form of entertainment, one that women could enjoy. Tony Pastor (1837–1908), a singer and comedian, opened his "New Fourteenth Street Theater" in the 1870s. His shows featured singers, dancers, instrumentalists, comedy, and skits, and his theater quickly became a great success. Ned Harrigan (1844–1911) and Tony Hart (1855–91) developed shows that interspersed spoken dialogue with songs and dances and that featured ethnic humor and satire. *The Mulligan Guard Ball* (1879) was their first major success, which was followed by a string of hits in the 1880s.

Harrigan and Hart worked with Dave Braham, an English songwriter who wrote their most popular songs. Harrigan and Hart hits such as "The Babies on Our Block," "Paddy Duffy's Cart," and "The Widow Nolan" were among the most popular songs of the 1880s.

The last decade of the century witnessed the first attempts to establish African-American professional theater in New York. The first productions such as *The Creole Show* (1889) and *Black America* (1895) were linked to minstrelsy. *Clorindy; or, the Origin of the Cakewalk* (1898) was the first successful African-American musical. The music was composed by Will Marion Cook (1869–1944), a gifted musician who attended Oberlin Conservatory, the National Conservatory in New York, and studied violin with Joseph Joachim in Berlin. Cook entered theater music because, as an African American, that was one of the few avenues open to him.

The success of musical theater in New York City led its establishment as the center of a new kind of music industry. Many music publishing houses, including Thomas B. Harms (1881), Willis Woodward (1883), and M. Witmark & Sons (1885), were founded in the 1880s and 1890s. Most of these companies had offices on 28th Street between Fifth Avenue and Broadway, and the street became known as "Tin Pan Alley," a term that would later be applied to the industry in general. Publishers employed songwriters who concentrated their efforts on producing songs that would be commercially successful and earn money for the publisher. The publishers also employed song "pluggers" who would work to get new songs performed in vaudeville and musical theater. The songs of Tin Pan Alley were almost all in major keys, and many were in waltz time. They usually include a brief piano introduction followed by verses

alternating with a chorus. Among the most popular were “After the Ball” (1892) by Charles K. Harris, “Daisy Bell” (1892) by Harry Dacre, “Sidewalks of New York” (1894) by Charles B. Lawlor and James W. Blake, “The Band Played On” (1895) by John E. Palmer and Charles B. Ward, “Sweet Rosie O’Grady” (1896) by Maude Nugent, and “When You Were Sweet Sixteen” (1898) by James Thornton. Each of these sold more than 1 million copies and remain popular and familiar today.

The 1890s saw the publication of the first songs in a new style known as “ragtime.” By 1898 ragtime songs were being performed on the New York musical stage, and a national ragtime craze had begun. The style evolved in the saloons and brothels of St. Louis, but in the music of its greatest artist, Scott Joplin, it attained a level of sophistication that has led to its being considered the first African-American art music. Joplin’s “Maple Leaf Rag” (1899) sold more than 1 million copies, a remarkable amount for a difficult piano solo.

Concert bands were popular throughout the 19th century, and the last decades of the century saw the rise of some very successful and popular professional bands.

Although John Philip Sousa achieved success as a composer of theater music, his greatest success was as a band leader. Sousa directed the United States Marine Band and in 1892 formed his own band, which achieved worldwide fame and had a great impact on American musical taste.

Perhaps the greatest contribution of the 19th century to the history of music was an invention. In 1877 Thomas Edison produced the first sound recordings. While commercial recordings were not widely available until the turn of the century, this invention profoundly affected the way music was created and consumed, setting the stage for the musical world of the 20th century.

### ***Nation, The***

The first weekly journal of opinion to achieve long life and wide influence, the *Nation* was founded in 1865 by EDWIN L. GODKIN as a 16-page paper filled with literary criticism and commentary on American political and social life and problems. The list of the contributors to the *Nation* from 1865 to 1900 encompassed most of the famous American and many of the well-known British scholars and thinkers of that period. Godkin concentrated his efforts on political and social commentary and developed an avid nationwide following among the educated and professional classes. The *Nation's* circulation never reached more than 12,000, but it was read by influential people—lawyers, ministers, and college professors—who from pulpit and lectern spread the opinions fostered in it. Although the *Nation* has been identified with progressive causes in the 20th century, under Godkin in the 19th century it adhered to the classic liberal doctrine of *laissez-faire* and advocated small government, CIVIL SERVICE REFORM, a revenue (not protective) tariff, and the gold standard for money. Among adherents of those views, like the English poet and critic Matthew Arnold and British historian JAMES BRYCE, the *Nation* was the best weekly in America and possibly the world.

### **National American Woman Suffrage Association**

See WOMEN'S RIGHTS.

### **National Association of Colored Women (1896– )**

An association of African-American women's clubs, the National Association of Colored Women (NACW) was founded in 1896. It united two earlier groups, the National League of Colored Women (founded in 1893) and the National Federation of Afro-American Women (founded in 1895) and followed in the wake of the founding in 1890 of the General Federation of Women's Clubs (GFWC).

During the 1890s women's clubs were burgeoning. A few GFWC clubs had black members, but most of these clubs were all white. And few black clubs were federated with GFWC clubs on a state level. But in rare instances in which state federations tried to send black delegates to the national convention, the GFWC refused to seat them.

The clubs that made up the NACW, though, had aspirations that went beyond those of the white women's clubs, which tended to emphasize individual growth. The aim of the NACW was to improve the lot of all AFRICAN AMERICANS; its motto was "lifting as we climb." Its membership was also broader than that of the GFWC, which was overwhelmingly middle class. While the leadership of the NACW and its clubs tended to be middle class, a significant portion of its membership was working class or poor.

An additional aim of the NACW was to counter negative stereotypes about black women; in fact, it was anger over these stereotypes that had led to the founding of the organization. In 1895, on a speaking tour of England, IDA BELL WELLS-BARNETT brought international attention to LYNCHINGS in the United States. The president of the Missouri Press Association, James Jacks, defended the South in an angry letter to a British antilynching society, writing that "the Negroes in this country were wholly devoid of morality, the women were prostitutes and all were natural thieves and liars." His letter was widely publicized, and it was in response to it that Josephine St. Pierre Ruffin called the conference in 1896 that led to the formation of the NACW.

In her opening address Ruffin said, “for the sake of our own dignity, the dignity of our race, and the future good name of our children, it is ‘mete right and our bounden duty’ to stand forth and declare ourselves and principles, to teach an ignorant and suspicious world that our aims and interests are identical with those of all good aspiring women.”

Black women’s clubs were not new. Black women had joined together before the Civil War to fight slavery and to aid escaped slaves. During the Civil War groups of black women had provided support for the black regiments and aided the Union war effort. And after the Civil War clubs were often formed to promote specific projects. After the formation of the NACW, however, the number of clubs seemed to multiply exponentially. By the NACW’s ninth biennial meeting in 1914, it had more than 1,000 clubs.

The NACW had also developed into a remarkable self-help organization. Clubs held mothers’ meetings, visited prisoners, promoted temperance, sponsored lectures, provided community reading rooms, supported orphanages, and aided the indigent elderly. Some clubs were able to do more than others. The Washington and Chicago clubs had nurseries for young children, KINDERGARTENS, sewing classes, cooking classes, and savings banks. The Chicago club also ran an employment bureau. Some city clubs offered aid to homeless and friendless girls. A club in New Orleans supported a training class for nurses. The federation in Alabama supported the Mt. Meigs Reformatory.

Although the primary emphasis of the clubs was on social welfare, they also supported woman suffrage and were at the forefront of the civil rights movement. The NACW worked to repeal JIM CROW LAWS, supported integration and antilynching efforts, and pushed for equal accommodations on RAILROADS. The NACW is the oldest African-American secular organization still in existence.

### **national banking system** (1863–1913)

Ever since President Andrew Jackson orchestrated the destruction of the Second Bank of the United States in 1832, Whig and later Republican political leaders had wanted to establish some type of national banking system. During the antebellum period, the principal form of currency in the United States had been notes issued by state-chartered banks. With the dismantling of the Second Bank of the United States, which had kept state banknotes in check, the number of different banknotes in circulation dramatically increased. When the Civil War began, the advo-

cates of a national banking system were given the chance to remedy the situation. Several southern Democrats who had favored state-chartered banks and opposed any form of centralized banking system left CONGRESS, thereby giving the Republicans a majority. Salmon P. Chase, the secretary of the treasury in the Lincoln administration, also argued that a national banking system would provide a more stable, uniform paper currency and would help finance the Union war effort by providing a large market for government bonds.

Congressional legislation in 1863, 1864, and 1865 created a new national banking system that existing or newly formed banks could join if they had enough capital and were willing to invest one-third of it in federal bonds. The national banknotes were to be uniform in design and backed by federal bonds that the banks would buy and deposit with the Comptroller of the Currency (a new division within the Treasury Department) in return for the notes. If a national bank should fail, the bonds would then be liquidated and the note holders compensated without loss.

Although the idea sounded feasible, it did not work out as planned. Note-issuing banks did not give up their state charters and join the national banking system, as was anticipated, until 1865 when legislation placed a prohibitive 10 percent tax on state banknote issues. Existing banks found the new laws more restrictive than the ones they had been operating under. These restrictions included bond purchase requirements, a limitation on the amount of notes any one national bank could issue to 90 percent of the market value of the bonds it deposited with the Comptroller, and a limit of \$300 million on the total number of national banknotes issued for the nation. The new legislation also set minimum capital requirements for national banks that were too high to make joining the system profitable for banks in small towns. They also prohibited the popular practice of extending loans on the basis of real estate collateral, a major drawback in rural, agricultural areas, where land is the major asset possessed by many of the people. Faced with these operating restrictions, many existing banks chose not to give up their state charters and did not join the national banking system. The goal to make all banks national banks during the Civil War was not achieved, but by the end of 1865 there were 1,600 national banks, mostly former state banks, located primarily in the Northeast.

The shortcomings of this policy had a tremendous effect on the nation’s economy in the late 19th century. The national banking system with its many restrictive policies never flourished in the nation’s small towns and rural areas and as a result remained a mostly urban and northeastern institution. Furthermore, the state banks (which were favored by many Americans living in rural, agricultural parts of the country) were nearly destroyed by the 10 percent tax Congress placed on state banknotes. The idea

behind this tax was to force all banks (state-chartered and private) to join the national system. The system soon earned the reputation in rural America as the tool of the wealthy industrialists and financiers of the urban Northeast.

Another problem that plagued the national banking system in the post-Civil War years was its susceptibility to financial panics. It was unable to do anything about the periodic shortages of cash and credit that are a natural part of the BUSINESS CYCLE. The system was based on cash reserves, and the total amount of cash could not be quickly altered because the system lacked a central institution that could hold the reserves of the commercial banks and, most importantly, could increase those reserves to meet demand. The politics of banking eventually became intertwined with the CURRENCY ISSUE as financial panics and industrial depressions struck the nation in 1873, 1884, and 1893. Those Americans most affected by the economic downturns, the farmers, targeted the national banking system and the government's reliance on the gold standard for their most vocal attacks.

Members of the FARMERS' ALLIANCES and later the PEOPLE'S PARTY (Populists) called for currency inflation in the form of either an increase in the amount of greenbacks (fiat money issued during the Civil War) in circulation or the free and unlimited coinage of silver (FREE SILVER MOVEMENT). They also advocated the abolition of the national banking system and the creation of a subtreasury system to take its place. In 1913 the more flexible, decentralized Federal Reserve System would replace the national banking system as the central banking institution of the United States in 1913.

## Native Americans

From 1870 to 1900 Native Americans lost significant amounts of land and power to the U.S. government, which

already had begun to remove and in some cases force Indian tribes onto reservations, making them wards of the government. Major tribes were assigned reservations in which to live, often far from their original homes and sometimes alongside enemy tribes. Wars on the Great Plains and in the Southwest, often brutal, eventually defeated hostile Indian tribes by attrition. Significant federal legislation, such as the well-intentioned DAWES SEVERALTY ACT of 1887, dissolved tribes as legal entities and distributed communal lands to individual Indians, which greatly reduced the land owned by Native Americans. Further, the EXTERMINATION OF THE BUFFALO took away the Plains Indians' way of life and economy, forcing nomadic tribes to adopt a settled farming lifestyle. Although humanitarian Easterners established reform groups to aid Native Americans, these organizations tended to be paternalistic and worked to further separate Indians from their traditional ways of life and assimilate them into the larger white society.

The wars against Native Americans waged by the U.S. government subdued Indian tribes and opened up their lands for white settlement in the frontier regions of the plains, the Southwest, and the Pacific Northwest. After the Civil War the government was successful in relocating various bands of the Sioux Nation (RED CLOUD was their most conspicuous leader) on reservations as a result of the SIOUX WARS. Several bands, however, most notably the Oglala, Hunkpapa, and Miniconjou, resisted government efforts to relocate. In the War for the Black Hills (1876–77), the federal government aimed to remove Sioux tribes and clear the way for mining interests, but at the Battle of the Little Bighorn (June 25, 1876), General George Armstrong Custer's troops were annihilated by SITTING BULL and CRAZY HORSE (Custer's Last Stand).

Tragically, the 1877 NEZ PERCE WAR was fought by the army against a people who could not be characterized as hostile to white settlers and who were protesting their removal from land in Oregon on which they clearly had a right to remain. Led by Chief Joseph, the Nez Perce's incredible 1,700 mile retreat through Idaho and Montana, during which they continually fought off the U.S. Army, ended with their surrender within a few miles of the Canadian border. Despite assurances that they could remain in the Northwest, they were shipped off to the Indian Territory (present-day Oklahoma), although ultimately they were allowed to return to reservations in Idaho and Washington.

The APACHE WAR, marked by frequent skirmishes and battles along the border between the United States and Mexico, lasted from the early 1870s into the 1880s. During the struggle the military, intent on bringing peace to a region plagued by frequent Apache raids, focused on securing the area for copper-mining interests after settlers began to mine copper ore. The government tried to subdue

the disparate bands of Apache by consolidating them at the San Carlos Reservation in eastern Arizona, succeeding only after GERONIMO's renegade fighters were resettled in Florida in 1886.

The last of the Sioux Wars, indeed the last of all the Indian wars, came in late 1890. Sioux Indians adopted a movement that had started in the West 20 years earlier called Ghost Dancing, which involved communing with ancestors via a trancelike dance. The practice of Ghost Dancing unnerved the agents in charge of the Pine Ridge Reservation, where it had become popular, and in 1890 the U.S. Army moved in to monitor the situation. Reservation agents killed Sitting Bull, who had joined in the movement and whom they suspected was stirring up trouble, while trying to arrest him. Fearing an uprising, the army on December 29, 1890, massacred at Wounded Knee Creek a group of Miniconjou Sioux suspected of planning to revolt with their Sioux brethren at the Pine Ridge Reservation. The massacre united the Sioux, who ambushed military personnel the next day. Outnumbered, the Sioux surrendered on January 15, 1891, a date that historians have called the end of the Indian wars.

Federal legislation, backed by humanitarian reformers in the INDIAN RIGHTS ASSOCIATION, aimed to acculturate Indian customs and tradition and to assimilate Native Americans into the dominant Euro-American society. The Dawes Severalty Act of 1887, which opened western lands to individual ownership and broke the Native American tradition of collective landholding, allotted reservation lands to each tribal member. The act formed the basis of federal policy toward Native Americans until the 1930s. Western interests, including railroad companies, tended to support the act, since it would put surplus lands formerly held by tribes for sale, opening Indian lands to free-market forces. Reformers believed that passage of the law would help Native Americans realize the benefits of land ownership and therefore help them become full U.S. citizens. Over time, the long wait (25 years) for full title to land was considered an impediment and after 1906 could be shortened by the secretary of the interior. The Dawes Act decreased the size of Indian landholdings dramatically; by the 1930s Indian landholdings were only a bit more than one-third of what they were at the time the Dawes Act was passed, and two-thirds of Native Americans had no land at all. The

Photograph of a Sioux village taken in 1891, one month before the events at Wounded Knee (*Library of Congress*)

Indian Rights Association's goals of assimilation mirrored the federal government's objectives in subduing the Indian tribes, as both worked to replace Indian religious traditions, social organizations, and cultural attitudes with Christianity, codified systems of laws, western-style schools, and a Protestant work ethic.

The Office of INDIAN AFFAIRS (often referred to as the Indian Bureau), attempted to carry out federal Indian policy. During the Gilded Age it established a few off-site boarding schools (the most famous Indian school was founded in 1879 at Carlisle, Pennsylvania) that worked to assimilate young Native Americans by separating them from their homes and culture. The Office of Indian Affairs was charged with the task of overseeing the Indians on reservations and carving up those reservations under the Dawes Act. Shrinking landholdings forced Native Americans to abandon hunting and adopt farming, for which they had little inclination, on land that was not productive, with the result that food rations were needed, which in turn kept tribes dependent on the federal government. The Office of Indian Affairs remained a paternalistic force in Indian culture until the 1930s, when the agency became more concerned with protecting Native American culture and heritage and promoting self-determination among the tribes.

The extermination of the buffalo, which occurred throughout the course of the 19th century, culminated in a 10- to 15-year period of intense slaughter during the 1870s and 1880s, when the animal was nearly hunted to permanent extinction. The disappearance of the buffalo destroyed Plains Indians' culture and economy, made them dependent on grazing and farming, and broke their resistance to the invasion of white settlers. By 1880 all the wild buffalo in the southern plains had been killed. In the northern plains, extinction was delayed by the war with the Sioux for the Black Hills, but by 1879 the species was extinct in Wyoming and eastern Nebraska and by 1883 in Montana and the Dakotas. The extinction of the buffalo coincided with the removal of the Plains Indians to reservations.

Some Native Americans, after resisting the army and the hordes of white settlers, ceased their opposition. Red Cloud, a most formidable Sioux warrior during the War for the Bozeman Trail in 1866, negotiated a treaty at Fort Laramie in 1868 and adopted a peace stance in future wars. He was either hailed as a realistic statesman who understood the futility of further resistance or mistrusted as a sellout co-opted by the U.S. government, although he never received much from it for his cooperation. Other prominent Native American warriors became part of a sideshow in American popular culture during the 1890s, after all of the hostile western tribes had been successfully subdued. Geronimo became the most well-known Apache to whites, appearing at the St. Louis World's Fair in 1904 and in President Theodore Roosevelt's inaugural parade in 1905. Sitting Bull,

after being imprisoned by the U.S. government from 1881 to 1883 for conspiring during the War for the Black Hills, toured with WILLIAM FREDERICK (Buffalo Bill) CODY's Wild West Show between 1885 and 1886, performing with luminaries such as the sharpshooter Annie Oakley.

The reduction of Indian landholdings accelerated toward the end of the Gilded Age. Even Oklahoma's Five Civilized Tribes (the Cherokee, Choctaw, Chickasaw, Creek, and Seminole), who were considered the most "sovereign" Native American tribes, and the Osage were in 1898 no longer exempt from the Dawes Act, with the result that their lands were sharply reduced to accommodate white settlers. Western lands that in 1870 were almost exclusively occupied by Indians, like Montana and the Dakotas, were in 1889 granted statehood. By the end of the 19th century, tribal sovereignty had ended, and most Indians were on the way to becoming U.S. citizens. But rather than being integrated into the larger society, Native Americans were marginalized economically and physically on its fringes.

## nativism

Prior to the Civil War the influx of large numbers of Roman Catholic immigrants, primarily from Ireland but also from Germany, aroused fears that produced an organized nativist, or anti-immigrant, movement in the United States. Nativists argued that the newcomers (who tended to join the Democratic Party) corrupted politics by selling their votes and robbed native workers of their jobs by working for low wages, but at the core of this xenophobia was anti-Catholicism. The nativists organized the American Know-Nothing Party, which upon the demise of the Whig Party in 1854 showed surprising strength on the state level, but antislavery quickly eclipsed anti-Catholicism and the American Know-Nothing Party disappeared.

After the Civil War ended in 1865, the pace of IMMIGRATION quickened, and by the 1880s it had become more cosmopolitan. (Chinese and Japanese laborers, for example, were attracted to California.) Between 1880 and 1924 almost 27 million immigrants came to the United States, but unlike earlier arrivals, most of them were from southern and eastern Europe. This "new" immigration was accompanied by a revival of nativism that stressed the old

fears: anti-Catholicism, widespread unemployment, and wage reductions. However, this wave of nativism latched on to a new, apparently scientific justification for xenophobia. Nativists such as Madison Grant and others popularized a pseudo-Darwinian belief that the new immigrants were mentally and physically inferior and would corrupt America's superior northern European stock. Arguments were also made that the newcomers would promote radical or un-American ideas, were prone to crime and poverty, and posed a threat to traditional American customs and values.

Nativist groups such as the AMERICAN PROTECTIVE ASSOCIATION (APA) and the Immigration Restriction League (which advocated a literacy test for immigrants) sprang up throughout the United States. They used anti-Catholic, anti-Semitic, and anti-Asian rhetoric to promote a backlash against the newcomers. Later, in the 1920s, members of the revived Ku Klux Klan often resorted to violence and intimidation to dissuade immigrants from settling in certain communities. In that decade, nativists successfully called on the federal government to rethink its open-door

immigration policies and adopt IMMIGRATION RESTRICTIONS that would limit the number of immigrants from each country allowed to enter the United States.

### New South

The term *New South* was used to describe the post-Reconstruction economic development of the former Confederate states. In the years following Reconstruction, many southern leaders viewed the agriculture-based economy of the antebellum South as no longer viable and argued that the Confederacy had lost the Civil War because its economy had been unable to compete with the industrialized

Boys working at Cross Mountain Mine, Knoxville Iron Company, in Coal Creek, Tennessee. Photograph by Lewis Wickes Hine (*Library of Congress*)

North. They believed that the future of their region lay in economic diversification and industrialization. Among those who advocated a modernized southern economy was Henry W. Grady, editor of the *Atlanta Constitution*. By the mid-1880s, Grady had become the leading spokesman of the New South ideology.

Several southern politicians and businessmen joined Grady and others to introduce a new spirit of enterprise into southern life. Lacking capital, southern leaders actively pursued northern and European economic investment. Capital from these sources poured into the South, helping to develop the region's RAILROADS, cotton textile mills, tobacco factories, and iron and STEEL industries. As a result, many southern industries came to be controlled by directors who lived outside the region and made decisions that affected the South's economy.

Railroads and steel were two New South industries that were especially attractive to northern and foreign investment. During the 1880s railroad construction in the South outpaced the national average, with more than 180 new railroad companies appearing in the region. Southern railroad mileage increased from 16,605 miles in 1880 to 39,108 in 1890. In 1886 southern railroads changed the gauge of their tracks to correspond with the national standard, thus bringing the southern rail lines into the national transportation network. The economic depression of 1893–97 led to the reorganization and consolidation of several southern railroads, giving more economic power to northern bankers and financiers. Expansion of the South's iron and steel industries was fueled by the discovery of great iron deposits in Tennessee and northern Alabama, the proximity of coal and limestone deposits, the rapidly developing transportation system, and the influx of northern and English capital. Between 1880 and 1890 Southern production of pig iron more than doubled. By the late 1890s, Birmingham, Alabama, had become one of the world's largest producers of pig iron.

Another southern industry that witnessed a rapid growth in the years following Reconstruction was cotton textile manufacturing. Between 1880 and 1900 textile production in the South increased from 5 percent to 23 percent. Initially, southerners provided the capital for this expansion; by the 1890s investors came increasingly from the North as New England mill owners began to recognize the benefits of relocating their businesses to a region with a ready supply of cheap, nonunion labor; abundance of water power; and low taxes. And finally, the rapid expansion of the tobacco industry in North Carolina and Virginia resulted from the introduction of new machinery, northern investment, and an increased demand for cigarettes.

Although several southern leaders called for the development of a New South based on the growth of new industries, others were hostile, and nostalgia for the Old South

lingered. The myth of the “lost cause” permeated nearly every aspect of southern life, portraying the Confederacy's struggle against the North as a noble effort to preserve the values of the antebellum South. Also, southern agrarians attacked the New South, blaming industrialism—especially northern bankers and capitalists—for the breakdown of the family farm and the movement away from traditional southern values.

## newspapers

During the last third of the 19th century, a number of changes took place in the United States that greatly impacted newspapers. After the Civil War they reflected a landscape changed by rapid urban growth and the SECOND INDUSTRIAL REVOLUTION. Although preoccupied before the war with slavery, newspapers now confronted social issues including labor unrest, WOMEN'S RIGHTS, and civil rights for freed blacks as well as economic issues like the TRUSTS, the TARIFF ISSUE, and the CURRENCY ISSUE. Newspaper circulation grew as population and literacy rates increased among blacks and whites. (In 1870 the literacy rate for whites was 88.5 percent and for blacks 20.1 percent, both rising a decade later to 92.3 percent for whites and 30 percent for blacks.) Technological changes affected both newsgathering and the printing of newspapers; reflecting trends in other businesses, publishing a metropolitan paper became a big business dependent on infusions of capital and subject to acquisition by a “chain.” The entire nation had changed, and what affected society affected the American press.

Some newspapers stepped up their collection of news and strengthened their financial base through increased ADVERTISING. New York City took the lead as the economic and political center of the nation, and its newspapers—already known for their complete coverage during the war—maintained their circulation and revenue figures. At the same time that advertising strengthened a paper's survival, editors and publishers began to think a bit more independently of party lines, since those newspapers most independent of party affiliation were most apt to survive.

A new generation of editors took over after the deaths or retirements of publishing giants like Horace Greeley, Henry Raymond, James Gordon Bennett, and William Cullen Bryant during the 1870s. The new editors—WHITELAW REID, EDWIN L. GODKIN, CHARLES ANDERSON DANA,

JAMES GORDON BENNETT, JR., and JOSEPH PULITZER, among the most prominent—were poised to cover and comment on a new world.

Reid, who took over the *New York Tribune* from Greeley, was consistently loyal to the Republican Party but exposed corruption in both major parties. Within the Republican Party he opposed ROSCOE CONKLING and supported his archenemy JAMES G. BLAINE. Reid aimed to make the *Tribune* a respectable, conservative paper written by gentlemen for gentlemen and avoiding the radicalism of his predecessor Greeley and the sensationalism indulged in by other contemporary papers.

The *New York Sun*, edited by Dana, gained prominence through his concept of presenting news in a crisp and amusing style. By the 1870s it was New York's leading daily. The *Sun* hired college graduates at adequate salaries and gave them the freedom to write as they chose. Although the *Sun*, like most of its competitors, focused on crime and scandal, Dana told his staff to stress the human-interest angles and the emotional impact of stories. (Although Dana is often remembered for assuring Virginia that there is a Santa Claus, that most famous editorial in the history of American journalism was written by Francis Pharcellus Church.) The *Sun* was often referred to as "the newspaperman's newspaper."

The *Sun's* closest competitor was the *New York Evening Post*, edited by Godkin, who was less interested in the news pages than the editorial pages. His eminently respectable and fiercely independent paper was peppered with intelligent, forceful commentary from a laissez-faire perspective.

The most flamboyant and erratic editor in these decades was Bennett, who inherited his father's newspaper, the *New York Herald*. When he took over its management in 1867 it was the largest and most profitable paper in the nation. Ostracized from society for unseemly behavior (when drunk, he once urinated in mixed company), Bennett moved to Paris but closely supervised the *Herald*. Although Bennett maintained the *Herald's* sense of decadence and sensational news, for years it remained the nation's leading paper in its thoroughness of news coverage. It also "created" news. For example, it financed Henry Stanley's search in Africa for missionary/physician David Livingstone. Undisciplined absentee control, however, took its toll, and by 1900 the *Herald* was in decline.

While the *Herald* and the *Sun* declined in the 1880s, the *New York World* became enormously prosperous, under the leadership of Pulitzer, whose formula for success was to mix sensational stories on crime and scandal with civic crusades. Perhaps the best known of his crusades was the campaign for schoolchildren's pennies to pay for the base of the STATUE OF LIBERTY, since CONGRESS was too stingy to appropriate the necessary funds.

The change to the independent (rather than party affiliated) press came largely as a result of the Industrial Revolution. The daily newspaper in the Gilded Age was produced at large industrial plants; gone were the days when the owner-editor could finance his business by selling his opinions. A split between ownership and editorship ensued, with editors often becoming "hired help." Newspapers became moneymaking business enterprises, not forums for personal opinion. Publishers sold stock to raise capital, causing editors to lose financial control of their papers. Advertising support became increasingly important and surpassed circulation income. By 1879 nearly 54 percent of all newspaper income was derived from advertising. And as journalists responded to changes in society, advertisers influenced the press in ways that would incense today's newspaper owners. Many advertisers believed they had a right to influence the editorial or news pages of papers that carried their ads, and they often boycotted newspapers because of the stories they covered or editorial positions they took.

While business pressures increased, political influence declined. As independents, newspaper editors were free to criticize their own political parties and look more objectively at world events and their impact on society. Editors began to adopt a different set of news values that conformed to the newspaper's role as holding up a mirror for society to view itself. That trend made it difficult to tell whether news or editorials shaped public opinion or whether the press reflected the public's opinion.

During the late 19th century, blacks broke into journalism and women played a more prominent role in newspapers. The first AFRICAN AMERICAN to be hired as a reporter was T. Thomas Fortune, who began writing for the *New York Sun* in 1887. He went on to publish his own paper, the *New York Age*. Other former slaves, such as Frederick Douglass, purchased newspapers, and the U.S. census for 1880 estimated that there were 31 black-owned newspapers, all weeklies. Although women had always worked on newspapers covering weddings and society events, these decades saw the beginning of the hiring of a handful of women who covered national politics (before they had the right to vote), including Mary Clemmer Ames (*New York Independent*) and Emily Briggs (*Philadelphia Press*). The most famous woman reporter of the day was the *New York World's* Nellie Bly, who pioneered investigative reporting by feigning insanity to get herself committed to New York's Women's Lunatic Asylum and then writing a sensational exposé of conditions there. She is best remembered for making in 1889 the fastest (and most publicized) trip around the world, completing the journey in just 72 days.

The greatest changes affecting newspapers in the last 30 years of the 19th century came about because of technology. The invention of the telephone in 1876 permitted reporters in the field to phone in their stories, speeding up the pro-

cess of getting news events into print and creating a more informed world at a faster pace. At the same time, technological advances made it possible to decrease the cost of publishing a newspaper and increase the distribution, so that the news traveled faster than ever before. The world was growing smaller, thanks to submarine telegraph cables, the invention of a completely automatic (rather than manual) printing press, and the creation of a national rail system. In 1875 the Pennsylvania Railroad began running fast mail trains seven days a week. A train originated in New York City loaded with the morning's newspapers, delivered them within hours to Philadelphia, and then delivered New York and Philadelphia newspapers to Chicago by the next morning.

The "new journalism" of the mid-1880s is renowned as the golden age of journalism. The number of newspapers published increased at a roaring pace. Between 1870 and 1900, some 1,200 newspapers began operating in the United States. Printing technology had advanced (the linotype was in wide use by the 1890s), and paper produced from wood pulp made newsprint cheaper than ever before. Screen printing was perfected, and, through a halftone process invented by Stephen Horgan in the late 1890s, photographs in newspapers were clear and crisp and began to surpass the use of engraved illustrations.

In the 1890s two opposing trends in newspapers became apparent. Adolph Ochs, a successful newspaper owner in Tennessee, purchased the *New York Times* in 1896 and proclaimed that it would be devoted to "all the news that's fit to print." In doing so he countered the popular sensational YELLOW JOURNALISM of Pulitzer and William Randolph Hearst, which at that moment dominated the New York newspaper scene and helped bring on the SPANISH-AMERICAN WAR. In addition, the influence of newspaper "chains" like those of Hearst and the Scripps family—with papers in several major cities—was growing. With Hearst and E. W. Scripps strongly influencing the editorial policies of their papers, individual newspapers were no longer the personal vehicle of the idiosyncratic editor and publisher. "One-man rule" gave way to a corporate style of management as newspapers became an industry. Competitors merged, and trade associations, such as the American Newspaper Publishers Association (founded in 1887), dealt with wide-ranging issues like unscrupulous advertising or biased reporting. The old-fashioned newspaper, led and dominated by dynamic and opinionated individuals, had entered a new world in the 20th century, with distinct jobs and philosophies for reporters, editors, publishers, advertising managers, and circulation managers.

## Nez Perce War

The ancient home of the Indian bands that constituted the Nez Perce Nation was in the mountainous region where Oregon, Washington, and Idaho meet. The Nez Perce, like other Native Americans, deified their ancestral land, and renouncing it was the equivalent of giving up their religion. In 1855 the federal government had guaranteed their title to their land, but in 1860 gold was discovered there. Miners rushed in and then remained to raise cattle and crops, despite the fact that they were trespassing. Federal Indian agents in 1863 bribed and coerced the chiefs of some bands to agree to a treaty moving them to Lapwai, Idaho, but other Nez Perce chiefs would not agree to the treaty and remained on their land. Among those was Chief Joseph (ca. 1840–1904), whose band lived in the Wallowa Valley of Oregon. President Ulysses S. Grant in June 1873 ordered that Joseph's band be given a reservation in part of the Wallowa Valley. Subsequent protests by white settlers, the governor, and the Oregon congressional delegation led to a reexamination of the case by the Office of INDIAN AFFAIRS (Indian Bureau) and a decision by Grant on January 6, 1877—two months

Chief Joseph of the Nez Perce, in 1900 (Library of Congress)

before leaving office—that the 1863 treaty obligated all Nez Perce to remove to Lapwai.

Joseph and his fellow nontreaty Nez Perce chiefs, Looking Glass and White Bird, hoped to reason with the Indian Bureau and the U.S. Army. But at a council on May 14, 1877, General O. O. Howard told them that if they did not move in 30 days he would drive them off their land. To avert war, the chiefs agreed to move to Lapwai. Beyond the pain of eviction, moving required the difficult task of rounding up thousands of horses and cattle. Some animals were abandoned to settlers and others were lost while fording the swollen Snake River on the way to Lapwai. Smoldering with resentment, the Nez Perce camped 10 miles from the reservation on June 2, and Joseph and his brother Ollokot used their last days of freedom to go hunting.

In their absence, young braves from White Bird's band, to avenge a murder two years earlier, murdered four whites and then went on a rampage with 17 other warriors, killing more than a dozen other settlers. When Joseph and Ollokot returned they tried to persuade all to await the army, surrender the guilty braves, and avert punishment for everyone, but they failed. The Nez Perce moved to a defensible position on White Bird Creek and hoped that Howard would send emissaries to talk and avoid further bloodshed, but that did not happen. The pursuing cavalry and volunteers sent no one to talk and attacked at dawn on June 17, 1877, but suffered a disastrous defeat, with 34 men killed while the Nez Perce had only three men wounded. With Howard in pursuit, Joseph crossed the Salmon River to a new defensible position. "No general," Howard remarked, "could have chosen a safer position, or one that would be more likely to puzzle and obstruct a pursuing foe." Despite his admiration, Howard relentlessly pursued the Nez Perce, who were encumbered by the old and infirm, women and children, possessions, and livestock. Throughout the summer and into the fall the Nez Perce outfought and, despite encumbrances, outmaneuvered the army on a 1,700-mile retreat that is a classic in military history. In October Colonel Nelson A. Miles and 400 men cornered the Nez Perce at Bear Paw Mountain in Montana, just short of the Old Woman's Country—Queen Victoria's Canada—where they hoped to find refuge. After a five-day battle in which both sides suffered heavy losses and Howard reinforced Miles, Joseph surrendered with the understanding that the Nez Perce could return to the Pacific Northwest. With his clothes riddled with bullet holes, Joseph gave his rifle to Miles, turned to Howard, and declared, "I am tired of fighting. Our chiefs are killed. . . . It is cold, and we have no blankets. The little children are freezing to death. . . . Hear me, my chiefs! I am tired. My heart is sick and sad. From where the sun now stands I will fight no more forever."

To the dismay of Miles, who remained an advocate of the Nez Perce to his death, his promise to Joseph was

ignored by Generals Philip Sheridan and William T. Sherman (who wanted to hang Joseph), and the Nez Perce were sent to the Indian Territory (present-day Oklahoma) where 68 died in their first year of captivity. In 1879 Joseph was allowed to go to Washington to plead for the return of his people to Idaho, but Secretary of the Interior CARL SCHURZ was afraid to allow them to return, since indictments were still out for the murders that began the war. In the 1880s the Nez Perce were allowed to return to the Pacific Northwest, but most of them, including Joseph, were kept at Colville, Washington. In 1899 and again in 1900 Joseph visited his beloved Wallowa Valley, but white settlers there would not sell him a small piece of land that had belonged to him and his ancestors. Joseph died in Colville on September 21, 1904.

**Norton, Charles Eliot** (1827–1908) *scholar, editor, art professor*

The leading American apostle of culture in the Gilded Age, Charles Eliot Norton was born on November 16, 1827, at Shady Hill, his family's 50-acre estate in Cambridge, Massachusetts, and died there 80 years later. His father, Andrews Norton, was a Harvard Divinity School professor, and his mother, Catharine Eliot, was the daughter of a wealthy Boston merchant, so Norton grew up in comfortable, intellectually stimulating surroundings. In 1846, when not quite 19, he graduated from Harvard with distinction in Greek, Latin, and political economy. The next day he started work on a Boston wharf for East India merchants, warehousing Calcutta hides, writing business letters, and running errands. Although he did not like his job, he worked conscientiously, using his free time in more congenial pursuits.

Despite his family's fortune, the maldistribution of wealth troubled Norton, who in late 1846 began conducting evening classes to help working men and boys escape from poverty. Years later, when one of them became mayor of Providence, Rhode Island, he credited Norton for turning his life around. Norton also found time for intellectual pursuits, writing articles on the diverse subjects of William Tyndale, translator of the Bible and martyr, and archaeological remains in western America, and helping FRANCIS PARKMAN revise his *Oregon Trail* for publication.

After three years in the countinghouse, Norton, in 1849, went to India as supercargo (to handle commercial transactions) for his firm. That trip and especially his extended journey homeward changed Norton's life. In India he disparaged British colonialism and caste systems

and was disturbed by the poverty and “superstitions.” He came home by way of Europe, arriving in Paris in spring 1850, where he met his lifelong friend, fellow-American George William Curtis. In England he developed a passion for medieval church architecture and was inspired by London art galleries. In fall 1850 he returned to the Continent and spent his time most profitably in Florence, where Elizabeth and Robert Browning welcomed him, and Browning, a discerning critic, lectured him on paintings as they visited art shops. In 1851, after touring 20 months, his father’s health and business demands required Norton to return home.

Norton engaged in East India trade on a modest scale until his father’s death in 1853, when he gradually withdrew from trade, while managing the family’s property and increasing his literary activities. These ranged from editing the theological papers of his father, a conservative Unitarian, to a perceptive, favorable review of Walt Whitman’s *Leaves of Grass* in 1855. Norton, however, was not robust, and that year a doctor ordered him to Europe. Accompanied by his mother and two sisters, Norton traveled, primarily in Italy, studied art and architecture, and concluded that they reflect the moral climate of an age. He befriended the English art critic John Ruskin, met literary figures (among them Charles Dickens and William Makepeace Thackeray), and began a translation of Dante’s *Vita Nuova*, which he printed privately as *The New Life of Dante Alighieri* (1859).

Upon his return to the United States Norton embarked on a 10-year career in journalism. Although he remained in poor health, he contributed articles to the newly established *Atlantic Monthly*, edited by his friend James Russell Lowell. Norton’s articles taught that fine art, architecture, literature, and scholarship, though deficient in America, can have a positive function in a society. Norton summed up many of his ideas on culture and society in *Notes of Travel and Study in Italy* (1860). He often despaired that the United States was too commercial, too corrupted by prosperity, too restless, too hasty to cultivate “the spacious world of noble and everlasting thought.” The North’s reaction to the outbreak of the Civil War gave him hope for the country, and he supported the Union cause. He also continued his studies, delivered 12 Lowell Lectures on medieval subjects, and in May 1862 he married Susan Ridley Sedgewick. In January 1863 JOHN MURRAY FORBES appointed Norton editor of the New England Loyal Publication Society. He selected articles (most of them previously published) and sent them to almost 1,000 editors, who served about a million readers weekly. Beginning with the January 1864 issue,

Norton became coeditor with Lowell of the *North American Review* and did most of the nitty-gritty work in giving new life to that old journal. In addition, Norton in 1865 was a founder of *The Nation* and for years was a frequent contributor to it.

Having resigned in 1868 as editor of the *North American Review*, Norton sailed for a five-year European sojourn. He was accompanied by his wife, who, like him, was in fragile health, their four children, his mother, and his two sisters. These were years of disappointment and disillusion but also of maturing scholarship. He became acquainted with Charles Darwin and a close friend of Thomas Carlyle. Industrialism, he warned, accentuated the gap between rich and poor in England, and unless stopped, the despair of the masses would lead to violent revolution. News from home of corruption in the Ulysses S. Grant administration dispelled Norton’s optimism for a future of political sagacity and republican purity.

In 1873, a year after his wife died in childbirth, Norton and his six children returned to Shady Hill. President CHARLES WILLIAM ELIOT of Harvard, Norton’s cousin, offered him a position in fine arts, starting in 1874. That fall Norton began 23 years of “preaching the gospel of Art to future generations of Americans.” He stressed that the fine arts reflected the moral and intellectual conditions of past ages but declared that Gilded Age America, with its plutocracy and poverty, machines and materialism, “starved the creative spirit.” While working to develop in his students an appreciation of great art and literature, Norton encouraged them to develop a creative spirit. Norton was opinionated. After denouncing all politicians except GROVER CLEVELAND, he denounced him for his bellicose message on the VENEZUELA BOUNDARY DISPUTE. Norton insisted in 1890 that all Harvard buildings built over the past 50 years were ugly and incongruous and should be destroyed. He attacked FOOTBALL for resembling the brutality of a Roman spectacle. He amused most students, was beloved by many, and profoundly influenced a few.

His scholarship was broad. He translated Dante’s *Divine Comedy* (1902), edited the poems of John Donne, and published *Historical Studies of Church-Building in the Middle Ages* (1880). When his dear friends, Carlyle, Lowell, Curtis, and Ruskin died, Norton edited their works, speeches, or letters. He died on October 21, 1908.

## oil

The petroleum industry originated in America in 1859 when Edwin L. Drake drilled the first successful oil well at Titusville, Pennsylvania. The small amounts of petroleum that previously had seeped to the surface were bottled for medicinal purposes. Drake invented (but neglected to patent) the drive pipe that is still used today. He also neglected to secure oil leases on adjoining lands and thus made very little from his momentous discovery. Others rushed in, however, for its impact was instantaneous. Petroleum could be easily distilled (refined) into superior lubricants and especially into kerosene, which when burned in a lamp provided superior lighting and was far cheaper than whale oil. The crude oil initially was transported in barrels by wagons and barges to RAILROADS, but railroads extended their lines into the western Pennsylvania oil fields and by 1865 had developed tank cars. A short pipeline was constructed in that same year, and by 1881 a long-distance pipeline connected the oil region with the eastern seaboard. By 1870, 5.3 million barrels, of crude oil were produced; in 1880, 26.3 million barrels; in 1890, 45.8 million barrels; and in 1900, 63.6 million barrels. Pennsylvania remained a significant producer of petroleum throughout the Gilded Age, but in the 1880s both Ohio and West Virginia were in production, and in the 1890s Wyoming, California, and Texas had oil wells. The great Spindletop Strike in Texas, however, did not come until 1901.

Initially chaotic, the oil industry was monopolized quickly by John D. Rockefeller and his associates. Indeed, it was more completely monopolized in the Gilded Age than when major oil fields outside Pennsylvania and the Old Northwest subsequently opened up. In 1865 Rockefeller began refining oil in Cleveland, Ohio, formed a partnership with other refiners in 1867, and in 1868, to compete in eastern markets, secured a rebate (reduced freight rate) from the New York Central Railroad. In 1870 his associates and others formed the Standard Oil Company of Ohio, bought out oil companies in Cleveland and elsewhere, and

controlled the largest refineries in the world, enabling Rockefeller to boast, “The oil business is mine.”

Building upon his great volume, Rockefeller secured further rebates with the object of destroying his competitors. In 1872, with THOMAS A. SCOTT of the Pennsylvania Railroad, Rockefeller revived the South Improvement Company to allocate the oil shipments of its 13 members (10 of whom were in the Standard group) among the New York Central, Erie, and Pennsylvania Railroads. The railroads doubled their oil freight rates but allowed the 13 members a 50-percent rebate plus drawbacks that would give 50 percent of their competitors’ freight rates to the South Improvement Company. Facing ruin, independents sold out to Rockefeller. The outcry against the South Improvement Company was such that the Pennsylvania legislature withdrew its charter, but Rockefeller continued to try to eliminate competition by rebates, underselling, creating tank-car and barrel shortages, and forming pools to fix prices and control production. By 1878 Rockefeller controlled well over 90 percent of the nation’s refining capacity.

Pools enlarged the Standard group, but they were unwieldy and, as Rockefeller said, “ropes of sand.” In 1882 the 41 stockholders of the Standard Oil Company signed a TRUST agreement that placed control of all the Standard group into the hands of nine trustees. This arrangement was so obviously monopolistic that the state of Ohio dissolved it in 1892. The Standard group’s monopoly, however, was hardly shaken, since it remained intact and in 1898 refined 83.7 percent of the nation’s oil. It also reorganized. The Standard trustees had already secured a charter for Standard Oil of New Jersey, which in 1899 was converted into a holding company by increasing its stock from \$10 million to \$110 million and exchanging this stock for the stock of the 40 members of the Standard group. Significantly its board of directors, headed by Rockefeller, was essentially the same group of men who had dominated the oil industry since the 1870s.

Oil well in California, 1898 (Library of Congress)

### Omaha platform (1892)

In July 1892 the PEOPLE'S PARTY (Populist Party) held its first national convention in Omaha, Nebraska, and adopted one of the most memorable party platforms in American history. With a stirring preamble written by Ignatius Donnelly of Minnesota, it proposed reforms dealing with transportation, land, and finance. The Omaha platform called for a graduated federal income tax; the nationalization of the transportation system; the Australian, or secret, ballot; the free and unlimited coinage of silver (see FREE SILVER MOVEMENT); a flexible currency system of at least \$50 per capita; laws to discourage large-scale land speculation and

alien ownership of land; IMMIGRATION RESTRICTIONS; the eight-hour work day; the direct election of U.S. senators; a constitutional amendment that would limit the president and vice president to one term; and the initiative that would enable the public to compel the legislature to consider a proposal and the referendum that would allow the voters to approve or turn down a measure.

This platform was not hastily assembled. As the FARMERS' ALLIANCES spread throughout the South and Middle West between 1887 and 1890, they prepared the way for the People's Party and the Omaha Platform by contributing ideas and leadership. At a meeting in Ocala, Florida, in 1890, representatives of the farmers' alliance discussed the option of fielding a national political party in the upcoming 1892 elections. It was at this meeting that the Ocala demands were issued and became the cornerstone of the Alliance movement for as long as it existed. First and foremost, the Ocala demands called for the creation of "sub treasuries" that would allow farmers to store their crops in government warehouses. In return, they could claim Treasury notes for up to 80 percent of the market value of their crops. This loan was to be repaid when the crops were sold. The idea was to allow farmers to keep their crops in storage until market prices were more favorable. At the same time, the low-interest government loans on the value of the crops would help farmers pay their annual debts. Furthermore, the Ocala demands urged the free and unlimited coinage of silver; a graduated federal income tax; an end to protective tariffs and the NATIONAL BANKING SYSTEM; the direct election of U.S. senators; and effective government regulation and, if necessary, control of all RAILROADS and public utilities. Thus, several of the reforms embodied in the Ocala demands reappeared in the Omaha platform, which in turn shaped the ideological core of the Populist movement. Although the Populists were defeated, most of the Omaha platform was subsequently enacted by the major parties.

### Open Door notes (1899–1900)

America's China policy at the turn of the century, called the Open Door, aimed to guarantee the free and equal access to Chinese markets and to prevent imperial powers from carving the "celestial kingdom" into a contentious patchwork of spheres of influence and special concessions. On September 6, 1899, Secretary of State JOHN HAY circulated a note

to the capitals of Britain, France, Germany, Italy, Russia, and Japan requesting that they agree to allow equal commercial opportunity in each other's spheres of influence in China. Only Italy, which had no sphere of influence, agreed wholeheartedly, while the others equivocated to varying degrees. Nevertheless, on March 20, 1900, Hay audaciously proclaimed that all the powers agreed, but it was essentially an American policy and binding on no nation.

The Boxer Rebellion that spring, which led to an international expedition of imperialist powers to rescue their besieged legations in Beijing, immediately threatened Hay's Open Door policy. Concerned that the great powers would utilize the presence of their troops to expand their spheres of influence, Hay on July 3, 1900, circulated a new note stating that the United States stood for the territorial integrity of all China and commercial equality for all throughout the land. Hay, however, had merely announced a policy that the United States had neither the means nor the moral fortitude to enforce. In the late summer of 1900, Russia occupied Manchuria, using the large number of troops that it had mobilized to help quell the Boxer upris-

ing. When queried by the Japanese as to what the United States planned to do to prevent its annexation by Russia, Hay admitted that the United States would not resort to armed force to make Russia abide by the Open Door. Furthermore, in November 1900, Hay himself was negotiating with China for rights to a naval station in Samsah Bay, which was within the Japanese sphere of influence.

Not surprisingly, the good will and the presumption of American honesty that were the policy's binding force quickly dissipated, and the policy was viewed abroad henceforth as mere empty rhetoric. What territorial and administrative integrity China retained resulted not from the forbearance of the great powers but from the stalemate produced by their fears of each other.

## painting

Late 19th-century American painters adopted a cosmopolitan outlook in their lives and an introverted focal point on their canvases, in contrast to the nationalist, extroverted stance of the prior generation. Luminism, a uniquely American style of realism, had been prevalent from the 1840s to the 1860s. A natural outgrowth of the Hudson River school and folk art, luminist painting sets out objects with clarity and bathes them in an even light, emanating from the center of the painting. Luminism is not a school or an art movement in the usual sense. Fitz Hugh Lane, John F. Kensett, and Martin Johnson Heade, the three most prominent luminist painters, may not have even known one another, but they were similarly influenced by earlier art and by contemporary philosophical movements, such as transcendentalism and spiritualism. Luminist paintings were still being produced in the Gilded Age by Asher B. Durand, ALBERT BIERSTADT, Heade, George Caleb Bingham, and others.

European training, especially that offered in Paris by the *École des Beaux-Arts* and affiliated ateliers, supplanted native schools. American painters entered the world stage, not only by exhibiting abroad but often by expatriating, especially to France and England. Subjects that had dominated canvases—confident Americans and marvels of the landscape—were replaced by quieter, reflective people and places. Sophisticated technique became at least as important as subject matter.

This change was especially apparent in landscape painting. While Bierstadt, Jasper Cropsey, and other Hudson River school painters continued to produce huge, minutely detailed canvases celebrating America's scenic wonders, the next generation chose to paint the poetry of place rather than delineate its particulars. French painters of the Barbizon school who forged a humble realism were important influences for Americans. The landscapes of George Inness, John Francis Murphy, and Alexander Helwig Wyant depicted circumscribed territories, such as

glades, fields, and streams. Subsets within landscape painting developed, such as the tonalist canvases of Birge Harrison, the dreamscapes of ALBERT PINKHAM RYDER, and the “glare aesthetic” of William Lamb Picknell. By the end of the century a decorative form of French impressionism came to dominate, with light-filled landscapes depicted in broad brush strokes and brilliant color. The canvases of Childe Hassam, Julian Alden Weir, Theodore Robinson, John Twachtman, and WILLIAM MERRITT CHASE were especially prominent.

Genre painting, or canvases with a narrative, which formerly had comprised only a small proportion of the American output, grew and diversified. Americans studied history painting, the highest art in the European canon, and from it learned how to paint the human figure and how to construct a story line. Like their European peers, Americans favored scenes of distant lands and remote times. Painters researched their subject through travel and reading and became experts in the topics. Orientalist artists such as Edwin Lord Weeks and Frederick Bridgman painted India and the Near East. George Hitchcock and Gari Melchers painted Dutch peasants, while George Boughton and Francis Davis Millet painted Puritans and colonists. Henry Ossawa Tanner, a successful African-American painter, produced symbolist biblical scenes. Religious, patriotic, and erotic subtexts were common in genre painting.

As the ranks of American's wealthy class swelled, so did the numbers of portraitists. While capturing a likeness was the basic measure of competency, elegance and refinement were also demanded. JOHN SINGER SARGENT and Chase dominated the field, but many able painters thrived, among them Cecilia Beaux, Charles Courtney Curran, Julius L. Stewart, and Irving R. Wiles.

With the proliferation of civic and religious buildings, opportunities for mural painting grew. By 1876 JOHN LA FARGE was put in charge of a team decorating Trinity Church in Boston, providing a model for future large, collaborative projects. Well-known easel painters

such as Elihu Vedder and Will Low produced murals, while others, such as Edwin Howland Blashfield and Kenyon Cox, became specialists in the field. Murals were meant to instruct and inspire, so they depicted paragons and paradigms (saints, historical figures, and allegorical scenes). They were an integral element in the American Renaissance.

American painting became a viable profession in the late 19th century. Having familiarized them with the European art world throughout their training abroad, American painters sought to establish sustaining networks in their own country. They exhibited in established institutions, such as the National Academy of Design in New York City and the Pennsylvania Academy of the Fine Arts in Philadelphia. Their works were showcased in a string of international expositions: the PHILADELPHIA CENTENNIAL EXPOSITION of 1876, the Universal Exposition of 1889 in Paris, the WORLD'S COLUMBIAN EXPOSITION of 1893 in Chicago, and the Universal Exposition of 1900 in Paris. The painters formed professional organizations to exhibit and sell their work, including the Society of American Artists and the Ten American Painters. American painters became scholars, writers, collectors, and connoisseurs, thus differentiating themselves from tradespeople. Commonly, painters kept elaborately furnished studios filled with works of art, antique furniture, and exotic objects. Many painters worked in more than one genre; landscapists populated their scenes with figures, genre painters took portrait commissions, and so on. The boundaries between easel painting, mural painting, interior design, and the production of the decorative arts became quite permeable. JAMES MCNEILL WHISTLER produced remarkable interiors, while LOUIS COMFORT TIFFANY abandoned painting for interior designs and glass-making. As painters became more professional and their numbers grew, and as artistic endeavour became a popular topic in the media, more Americans interacted with art.

## Pan-American Union

The Pan-American Union was established at a joint conference held in Washington in 1889–90, and since 1948 it has served as the secretariat of the Organization of American States. Although the 1826 Panama Congress—called by the South American revolutionary hero Simon Bolívar and enthusiastically backed by American secretary of state Henry Clay—was a fiasco, the idea of a hemispheric organization was revived in 1881 by Secretary of State JAMES G. BLAINE, who was anxious for closer commercial relations with Latin America. However, the assassination of President JAMES A. GARFIELD led to Blaine's resignation, and his unimaginative successor cancelled the invitations Blaine had sent for an International American Conference. By 1888 the value of hemispheric cooperation became apparent, and the GROVER CLEVELAND administration called for a conference in Washington to discuss an ambitious agenda to preserve peace and promote prosperity. Among the proposed items of discussion were avoiding war through arbitration, a customs union with common regulations, uniform weights and measures and a common silver coin, the protection of patents and copyrights, and the improvement of COMMUNICATIONS.

Appropriately, Blaine had returned to office as BENJAMIN HARRISON's secretary of state when, in 1889, representatives of 17 nations gathered in Washington as the First Inter-American Conference and elected Blaine as its presiding officer. As its leading spirit, he tried mightily to develop machinery to arbitrate disputes and to secure a customs union that would mutually lower tariffs and serve the economic interests of the United States. Both efforts failed, largely because Latin Americans feared that the power of the United States would be dominant in these economic and political arrangements. European traders, with their strong presence in Latin America, encouraged those fears because their interests would suffer if an American customs union were established. Blaine's other proposals of mutual coinage and transportation links met with lukewarm responses among the Latin American delegates. The conference, however, did suggest the appropriateness of reciprocal trade agreements, did consent to the arbitration of monetary claims, and did establish the Pan-American Union.

ANDREW CARNEGIE, one of the American representatives at the conference, in 1907 donated funds for the Pan-American Building, the organization's permanent headquarters in Washington. Meeting at irregular intervals at various capitals, the conferences accomplished little until 1910 at its fourth meeting, when it protected copyrights and patents. While the United States intended that the Pan-American Union promote its hemispheric hegemony, Latin Americans used it in the 1920s as a forum to protest intervention in Caribbean affairs by the United States and

by 1933 secured a resolution, to which the United States agreed, condemning intervention.

**panic of 1893** See BUSINESS CYCLES.

**Parkman, Francis** (1823–1893) *historian*

Historian of the British and French struggle to possess North America, Francis Parkman was born on September 16, 1823, in Boston. As he was not well, he went to live from age eight to 13 on his maternal grandfather's farm in nearby Medford. He loved the outdoors and tramped in the woods, trapped small animals, hunted with a bow and arrow, and collected rocks, bugs, and snakes. He returned to Boston to prepare for Harvard College, which he attended from 1840 to 1844. There he was a social success as president of the Hasty Pudding Club and excelled in subjects that interested him. His passion, however, was the wilderness and its dwellers, the NATIVE AMERICANS and the pioneers. On vacations, with backpack and canoe, he explored the White Mountains and Lakes George and Champlain. When he overtaxed his strength and injured himself working out in the Harvard gymnasium, he spent most of his senior year recuperating in Europe but returned in time to graduate. Parkman then entered Harvard Law School and received a law degree in January 1846 but never requested to be admitted to the bar.

In law school Parkman decided to make his hobby his life work, and an inheritance from his paternal grandfather made it possible. Between terms he visited Detroit and did research on the Ottawa chief Pontiac, and from April to November 1846, accompanied by his cousin Quincy Adams Shaw, Parkman followed the Oregon Trail to Fort Laramie in present-day Wyoming. Once there Parkman lived for weeks among the Sioux Indians, experiencing the tribal life of a Native American nation. He also observed French Canadian fur traders and American soldiers and settlers, on the edge of encroaching civilization. They offered clues to the behavior of the earlier people who would appear in what would become his great work. Parkman intended the trip to be part research and part restorative. His faith that outdoor exercise would cure his poor eyesight, headaches, and nervousness was not rewarded. Having suffered from dysentery and the glaring sun, the trip exacerbated his maladies.

In late 1846 Parkman went to New York, briefly read law, almost went blind, and took refuge in describing his western adventure for the *Knickerbocker Magazine* (1847–48). After consulting his journal, Parkman dictated his articles. They were a success, and, with help from CHARLES ELIOT NORTON, Parkman revised them for publication as *The Oregon Trail* (1849). Encouraged, Parkman persevered, despite virtual blindness, headaches, nervousness, and exhaustion, and began work on *The History of the Conspiracy of Pontiac* (1851). For six months he could write only six lines a day, but his health improved, and he finished it in two and a half years.

By 1850 Parkman was well enough to marry Catherine Scollay Bigelow; they had three children. His health took a turn for the worse when he suffered from water on the knee and could hardly walk for two years and in 1853 had such severe headaches his physician said he had but six months to live. Parkman bore his pain stoically, found therapy in horticulture (often tending flowers from a wheelchair), and became so adept that Harvard later named him professor of horticulture.

Parkman's mental anguish increased in 1857 with the death of his son from scarlet fever and the next year the death of his wife in childbirth. Leaving his daughters with his sister-in-law, Parkman went to Paris to consult a distinguished doctor and to research in the French archives. The trip was of little help physically or mentally, and on his return Parkman went back to his flowers, raising roses, rather than writing history.

Parkman rejoiced in 1861 when the Civil War galvanized the torpid North. The war also inspired him to work steadily on his history of the century-and-a-half colonial struggle for America. His grand scheme pitted the absolutism and Roman Catholicism of New France against the self-government and Protestantism of New England. Although a Bostonian, Parkman claimed to be neutral, since, as a patrician, his "political faith" lay "between two vicious extremes, democracy and absolute monarchy." He criticized both Catholic priests and Protestant clergy and despised Quaker pacifism. His conspicuous heroes were the great French, British, and American Indian leaders, soldiers, and explorers: Champlain, Frontenac, La Salle, Pontiac, Montcalm, and Wolfe. The victim in Parkman's drama was his beloved wilderness, despoiled by the struggle and its aftermath. With his dramatic narrative history as exciting as good fiction, Parkman is regarded as America's "greatest literary and Romantic historian."

It took Parkman almost three decades to complete his multivolume history. In 1865 he published *Pioneers of France in the New World*, followed in quick succession by *The Jesuits in North America in the Seventeenth Century* (1867), *The Discovery of the Great West* (1869), and in 1870 Parkman enlarged and revised his *Conspiracy of*

*Pontiac*. Parkman's health had improved sufficiently for him to visit historic sites and research in the Midwest and Canada. These visits helped Parkman describe poetically and accurately the geographical features of battlefields and to locate vanished Native American villages. In the 1870s he published *The Old Regime in Canada* (1874) and *Count Frontenac and New France under Louis XIV* (1877) and the next year, with recently available Paris archive materials, revised *The Discovery of the Great West* and renamed it *La Salle and the Discovery of the Great West*.

From 1878 to 1880 Parkman digressed from history to attack in the *North American Review* universal and woman suffrage and egalitarian democracy. Disturbed by Gilded Age political corruption, he believed that "intelligence and character, and not numbers," should govern. In the 1880s Parkman traveled widely and in 1884 published his best work, *Montcalm and Wolfe*, and eight years later filled in the gap between *Frontenac* and *Montcalm and Wolfe* with *A Half-Century of Conflict*. With his monumental work completed, Parkman died in Boston on November 8, 1893.

### Patrons of Husbandry

In 1867 the Patrons of Husbandry, better known as the Granger movement, was founded in Washington, D.C. Its strength was among farmers in the upper Mississippi Valley, who joined it to better their economic position and to enhance their social life. Led by Oliver H. Kelley, the organization originally had secret rituals that included songs, flags, costumes, and passwords and admitted both men and women to membership. Each local chapter was known as a "grange," and in many farming communities across the United States it became the center of social activity.

The Granger movement spread rapidly where farmers experienced the greatest hardships. In the years immediately following the Civil War, wheat and corn prices made farmers on the Great Plains optimistic. Unfortunately, the panic of 1873 coupled with severe blizzards, droughts, and grasshopper infestations dashed their dreams. Furthermore, faced with growing competition from Argentina, Australia, Canada, India, and Russia, farmers in the South and Middle West began to experience declining prices for their grains and cotton. Many of the nation's farmers were on the brink of bankruptcy, and many of them believed that only through collective action through the grange could their economic condition improve. They began to join the Granger movement en masse. In 1875, spurred on by the

publication of Ignatius Donnelly's influential weekly, the *Monopolist* (1874–79), membership in the National Grange of the Patrons of Husbandry reached a peak of 858,050.

Grangers blamed bankers, railroad operators, eastern land companies, and the manufacturers of farm equipment for compounding their sudden economic hardship. They complained, for example, that farm supplies and equipment were being sold at exorbitant prices, forcing many farmers to borrow money and incur debts averaging twice that of other Americans. Banks and eastern land companies charged farmers unusually high interest, making it difficult for farmers to pay off their mortgages. Grangers also complained to lawmakers about the price-fixing policies of grain wholesalers, warehouse owners, and grain elevator operators. Furthermore, they attacked RAILROADS for their discriminatory shipping rates that commonly charged farmers (who had no alternative means of transportation) more to ship their crops short distances than shippers (where competition existed) paid for long hauls. Grangers believed that the monopoly held by the railroads over travel and freight should be regulated for the good of the public.

Promotional print for Granger members showing scenes of farming and farm life (Library of Congress)

Between 1871 and 1874, the Grangers became very active in politics and scored major legislative victories in several midwestern states. The Granger movement gained a political boost from independent farmers' parties that had been organized in nine midwestern states and in California and Oregon. As a result, so-called Granger laws were enacted in Illinois, Iowa, Minnesota, and Wisconsin. In 1871 the Illinois legislature prevented railroads from charging less for a long than for a short haul. In 1874 the legislatures of Wisconsin and Iowa began to regulate interstate railroad freight rates. Just a year earlier, the Illinois legislature enacted the Warehouse Act, which established maximum storage rates for grains and other crops.

The constitutionality of the Granger laws was soon challenged in the U.S. SUPREME COURT. In Granger cases, the most famous of which was *Munn v. Illinois* (1877), the Court upheld the Illinois Warehouse Act on the grounds that states had the authority to regulate private property when it was used in the public interest. The Court denied that Illinois violated the DUE PROCESS CLAUSE of the Fourteenth Amendment or, in the absence of federal legislation, the commerce clause of the U.S. Constitution.

Along with its political program, the Granger movement also established cooperative enterprises for both the purchase of supplies and the marketing of crops. They opened retail stores, operated local grain elevators, and manufactured their own farm equipment. A few of the local granges even ran banks and fraternal life and fire insurance companies.

The deepening economic depression of the 1870s, however, dealt the Granger movement a severe blow as several of its cooperatives were driven out of business. By 1880 membership in the Patrons of Husbandry had dropped to 124,420 members. In addition, the Supreme Court in *WABASH V. ILLINOIS* (1886) overturned its earlier decisions in the Granger cases. The Court declared that under the commerce clause of the Constitution, states could not regulate railroad rates on interstate shipments. This regulatory void led CONGRESS in 1887 to pass the Interstate Commerce Act. Although membership in the Patrons of Husbandry declined nationwide, the grange survived as a center of rural, small-town life in New England and a few Middle Atlantic states. Despite these setbacks, the Granger movement increased public awareness of the monopolistic practices of the nation's railroads and set an example for farmer cooperation and political action that would influence agrarian protests for the rest of the 19th century.

**Peabody, Elizabeth Palmer** (1804–1894) *educator, publisher*

Founder of American KINDERGARTENS, and transcendentalist, Elizabeth Peabody was born in Billerica, Massachusetts, on May 16, 1804. When her mother, a teacher, became prostrated over the death of her seven-week-old baby girl, Peabody, at 15, taught her mother's school and became her family's financial mainstay. She worked in education the rest of her life. The oldest of seven children, she helped bring up her younger siblings, thought much about child development, and concluded that society could be reformed by properly educating children. She usually taught in her own schools, often with her sisters Mary and Sophia, but in 1834 she helped Bronson Alcott start the Temple School in Boston. Not only did she join him in his Socratic questioning of their scholars, but her description of their experiment in *Record of a School* (1835) brought Alcott notoriety and the friendship of Peabody's friend Ralph Waldo Emerson.

Teaching gave Peabody an independence, which, joined with her intellect and reading, enabled her to befriend as an equal male intellectuals. Emerson, who had tutored her in Greek in 1822, remained her friend and associate. In 1833 Peabody became acquainted with the educator Horace Mann, who seemed to have a romantic interest in her until he chose her sister Mary instead. In 1839, through the historian George Bancroft, Peabody obtained a position for Nathaniel Hawthorne at the Boston Custom House. Their names had been linked romantically, but he married her sister Sophia. Peabody and Reverend William Ellery Channing, whose daughter Mary attended her school in the 1820s, regularly discussed theology and literature on Saturday afternoons. Peabody not only influenced his sermons but also prepared 50 of them for publication, adding to his renown as the "apostle of Unitarianism." Years later she published her charming *Reminiscences of Rev. Wm. Ellery Channing, D.D.* (1880). John T. Kirkland, president of Harvard, invited Peabody to use his library and corresponded with her when he was in Europe. She also corresponded with William Wordsworth.

In 1840 Peabody opened her Boston bookstore in the front parlor of the house she had rented for her family. It became the meeting place for transcendentalists, and Margaret Fuller moved her famous Wednesday evening conversations there. Both the *Dial*, the quarterly magazine of transcendentalism, and Brook Farm, the famous Utopian community, were shaped in Peabody's bookstore,

whose doors remained open for a decade. In it Peabody, who knew 10 languages, made foreign books and periodicals available by purchase or loan and established herself as the first woman publisher in Boston and probably in the nation. Among her publications were Channing's pamphlet on emancipation, three of Hawthorne's children's books, the *Dial*, and the one issue of her own *Aesthetic Papers* (1849), containing Henry David Thoreau's "Civil Disobedience."

Between 1850 and 1884 Peabody wrote and published 10 books and 50 articles, most of which advanced her ideas on education. Captivated by a method of learning historical dates by Josef Bem, a Polish general, she devised charts to illustrate it and published her *Universal History* (1859) to accompany these charts. While publicizing this new system, she became known among educators, who attended her lectures and read her books and articles.

Through kindergartens Peabody made her greatest impact on education. She first heard about them in 1859, from Margarethe Meyer Schurz, who was part of the German kindergarten movement, founded by Friedrich Froebel. Although Peabody started a kindergarten in Boston the next year and with her sister Mary wrote *Moral Culture of Infancy and Kindergarten Guide* (1863), she was not satisfied until she had visited Froebel kindergartens in Germany (1867–68). Upon her return she promoted kindergartens as happy places where all children were involved and with her sister edited the *Kindergarten Messenger* for teachers. Peabody's promotion was so successful that by the century's end there was at least one kindergarten in every state in the nation.

During her last years Peabody, with her sister Mary, helped educate NATIVE AMERICANS by funding a school with Native American teachers, founded by SARAH WINNEMUCCA, advocate for Indian rights. Mary had earlier encouraged Winnemucca to write her autobiography and saw that it was published in 1883.

Peabody never married. Perhaps she was too formidable intellectually, too impossible to dominate, for males in that sexist time. Despite her sparkling conversation, her lack of interest in dress and appearance did not encourage romance. Although the portrait that the celebrated Boston artist Chester Harding painted of Peabody (in exchange for his children attending her school) burned in a warehouse fire, there is a vivid word portrait of her as Miss Birdseye in HENRY JAMES's novel *The Bostonians*. Peabody was almost 90 when she died in her home in Jamaica Plain, now part of Boston, on January 3, 1894.

—Olive Hoogenboom

**Peirce, Charles Sanders** (1839–1914) *scientist, mathematician, logician, philosopher*

Charles S. Peirce, the founder of PRAGMATISM, was born in Cambridge, Massachusetts. His father, Benjamin Peirce, the first U.S. mathematician with an international reputation, recognized his son's genius and developed his powers of concentration, but, as Peirce later remarked, failed to teach him "moral self control." He was disciplined when searching for laws and principles to solve the mathematical problems his father gave him, when at age 12 he set up his own chemistry laboratory, and when the next year he mastered his older brother's textbook on logic. At Harvard College, though, he was an indifferent student, graduating near the bottom of his class in 1859, doing whatever he pleased, such as studying Immanuel Kant's *Critique of Pure Reason*. Peirce's personal problems stemmed in part from his taking opium, the only available painkiller, for the facial neuralgia he suffered. HENRY JAMES noted, "he has too little social talent too little art of making himself agreeable," and Peirce accurately characterized himself as vain, snobbish, uncivil, reckless, lazy, and ill tempered. Worse, he was an unprincipled womanizer, seducing girls with promises of marriage. These shortcomings plagued his career and limited his influence.

Despite his love of philosophy Peirce pursued his studies in science and mathematics. He worked for the U.S. Coast Survey (with which his father was associated) in 1859 and was appointed to it in July 1861. He also studied chemistry at Harvard's Lawrence Scientific School and in 1863 received a Sc.B. degree summa cum laude. It was there that he met WILLIAM JAMES, who noted he was "independent & violent." In 1862 Peirce had married Harriet Melusina "Zina" Fay, a flamboyant feminist. It was not a happy union; they had no children.

Peirce did not abandon philosophy, but mathematics and science predominated during his 30 years with the Coast Survey. Even though he lectured at Harvard on the philosophy of science in 1864 to 1865, gave the university lectures in philosophy in 1869 to 1870, and the next year was the university lecturer on logic, President CHARLES WILLIAM ELIOT judged him not "safe" for a Harvard professorship. From 1869 to 1875 Peirce made astronomical observations at the Harvard Observatory, which were lauded by physicists and astronomers when he published them as *Photometric Researches* (1879). Beginning in 1873 he worked as a computer for the *Nautical Almanac*, investigating gravity, and in 1875 he went to Europe to bring

his country up to European standards in the science of geodesy (determining exact positions on the Earth). He lived extravagantly in France, sampling Medoc wines while studying the pendulum. When his wife left him in the fall of 1875, he became depressed and psychosomatically paralyzed. She returned to nurse him but left him permanently the next year. That same year he started a long affair with Juliette Pourtalai, whom he married in 1883, two days after his divorce. His work on the pendulum won him the thanks of the International Geodetic Association in 1877 and election to the American National Academy of Science.

Peirce thought of himself primarily as a logician. In the early 1870s he read draft chapters of a book on logic to the Metaphysical Club (to which he, William James, and Oliver Wendell Holmes, Jr., belonged). It was in these readings that the "name and doctrine of pragmatism saw the light." From 1877 to 1878 Peirce published "Illustrations of the Logic of Science" in six essays in *Popular Science Monthly*, the first two of these, "The Fixation of Belief" and "How to Make Our Ideas Clear," James called the "birth certificates" of pragmatism. Rejecting metaphysics, ethics, and deduction, Peirce advocated making the starting point of logic the world as we conceive it and observed that our conception of an object's effects is our conception of the object. These articles gave Peirce an international reputation, earning him praise as "the greatest living logician." In 1879 DANIEL COIT GILMAN appointed him lecturer in logic at Johns Hopkins University. Although his lectures were difficult to understand, Peirce inspired brilliant students, including John Dewey and Thorstein Veblen. Even though he was considered the world's greatest logician and had married Juliette the year before, Peirce lost his job at Johns Hopkins in 1884 when gossip became rampant about his long premarital affair with her. Losing his job started a long personal and professional decline.

Peirce's scientific work ended, and his income plummeted in 1891, when he was dismissed, in part because his reports were overdue, from the Coast Survey. In 1887 he and Juliette had moved to Milford, Pennsylvania, where they lived for the remainder of their lives in increasing seclusion and poverty. The Peirces were friendly with James and Mary Eno Pinchot, the millionaire parents of forester Gifford Pinchot, and Peirce occasionally saw New York City friends at the Century Club and continued to be extravagant with his declining income. His grandiose get-rich schemes (one involved painter ALBERT BIERSTADT) never came to anything. When not writing encyclopedia entries and reviews for the *NATION*, he concentrated on philosophic questions that intrigued him. Peirce believed in permanent truths and in the reality of God, with the search for truths requiring constant investigation, criticism, and correction. Natural laws, he believed, developed out of "pure chance" and were not absolute. His writings on logic,

while containing brilliant insights, were difficult to understand and were not published, but he continued striving to explain the universe. In his retirement he churned out approximately 80,000 difficult pages in that quest.

Realizing Peirce's increasingly straitened circumstances, William James and JOSIAH ROYCE, his Harvard philosophy colleague, helped Peirce by arranging, in 1898, for him to give a series of successful lectures in the informal setting of a Cambridge private home. In 1903 Harvard relented, thanks to James's persistence, and allowed Peirce to return to the campus to lecture on pragmatism. These formal lectures were called obscure, confusing, and unintelligible, and James, who could not understand them, did not recommend their publication. As Peirce became increasingly poor and reclusive, friends such as James, Royce, and the Pinchots aided him financially until he died, on April 19, 1914, a brilliant, tragic failure. His papers have been collected, and his influence lives on.

**pensions, veterans** See GRAND ARMY OF THE REPUBLIC.

**People's Party (Populist Party)** (1892–1908)

The People's, or Populist, Party was formed in response to the declining agricultural prices, rising operating costs, and high interest rates for agricultural credit that southern and western farmers confronted during the late 19th century. The strength of the People's Party lay in the South, Middle West, and Far West. It developed out of the National FARMERS' ALLIANCES, which was composed of the Southern and Northwestern Farmers' Alliances. The Alliance movement provided the Populists with membership, leaders, and ideas. Members of the Alliance movement made their initial foray into party politics during the 1890 elections when they aligned themselves with the DEMOCRATIC PARTY in the South and various independent farmers parties in the West. In 12 states, candidates supported by Alliance members won partial or complete control of the legislature. Alliance-supported candidates also won six governorships, three seats in the U.S. Senate, and 50 seats in the U.S. House of Representatives. These results encouraged several Alliance members to contemplate the creation of a

third national party that would focus on the demands of the nation's agrarian interests.

Between 1890 and 1892 the support for a third party grew rapidly within the Alliance movement. In December 1890 the Alliance held a national meeting at Ocala, Florida, and issued the so-called Ocala demands that put forth the following objectives: the direct election of U.S. senators; a graduated federal income tax; the free and unlimited coinage of silver; the establishment of federal "subtreasuries" (warehouses) for the storage of surplus crops, with government loans at 2 percent interest secured by those crops; and effective government regulation and, if necessary, ownership of the RAILROADS and public utilities. The Ocala demands represented radical ideas for that time. Anticipating that the Democrats and Republicans would resist endorsing the Ocala demands, many members of the Alliance movement were eager to form a party of their own. It seemed as if the two-party system would not or could not respond to the growing problems facing America's farming and laboring classes. Sentiment for a third party was strongest among western agrarians, but several southern leaders, such as Thomas E. Watson of Georgia and Leonidas L. Polk of North Carolina, also supported the idea.

Alliance leaders discussed plans for a national third party in meetings held at Cincinnati (May 1891) and St. Louis (February 1892). These meetings were attended by many Northwestern Alliance members as well as leaders of the Southern Farmers Alliance and representatives from the dying KNIGHTS OF LABOR. In July 1892 more than 1,000 delegates met at Omaha, Nebraska, for the first National Convention of the People's Party. The platform adopted at the convention, with a stirring preamble written by IGNATIUS LOYOLA DONNELLY of Minnesota, became known as the OMAHA PLATFORM and called for the Australian or secret ballot; a graduated federal income tax; the nationalization of the transportation system; the free and unlimited coinage of silver; a flexible national currency; inexpensive loans for farmers; laws to discourage large-scale acquisition of land; the direct election of U.S. senators; and the initiative which would enable the public to compel the legislature to consider a proposal and the referendum which would allow voters to adopt or reject a measure. Although the new political organization's name was the People's Party, the larger movement it belonged to was known as Populism.

In 1892 the Populists ran James B. Weaver, a former Union general and Greenbacker from Iowa, as their presidential candidate. For vice president they chose James G. Field, a former Confederate from Virginia. The Weaver-Field ticket won slightly more than 1 million popular votes and received 22 electoral votes. Weaver did very well in Colorado, Idaho, Kansas, Nevada, North Dakota, and Oregon. The Populists also elected five U.S. senators, 10

congressmen, and three governors, and nearly 1,500 Populist candidates won election to seats in state legislatures. Although the Populists had great success in the West, the party did very little in the Northeast. It also failed to gain much support in the South, where Populist strategy sought to build on the close relationship between African-American farmers and the mostly white local alliances that existed in the region. To do this, Populists stressed the common economic problems faced by all farmers and demanded fair elections. This strategy, however, was undermined by the prevalent racism in the region, ingrained Democratic loyalties, distaste for a presidential ticket headed by a former Union general, and widespread voter fraud and intimidation. The Populists' failure in the South ended any hope for an interracial agrarian reform movement.

Where the Populists won statewide elections, they established impressive reform records that included railroad and banking legislation, increased funding for public schools, and the exposure of corrupt business and political practices. Yet, despite its impressive record on state and local levels of government, the People's Party suffered from internal conflicts that prevented it from achieving a nationwide political base. It was also undermined by the two major parties, each of which incorporated some Populist programs into their platforms.

By 1896, the demand for Free Silver became an increasingly powerful force in America. The Populists had scheduled their 1896 national convention after those of the two major parties, assuming that both parties would be dominated by supporters of the gold standard. The Republican presidential candidate was WILLIAM MCKINLEY of Ohio, who was nominated on a platform that endorsed the gold standard. The Democrats, however, nominated WILLIAM J. BRYAN of Nebraska, who ran on a platform that emphasized stricter federal regulation of railroads and TRUSTS and supported Free Silver. When the Populists met in St. Louis, some believed that if they supported Bryan they risked losing their party identity, while others felt that if the party nominated its own candidate, they would ensure a McKinley victory in November. Ultimately, the Populists decided to nominate Bryan for president but named their own vice presidential candidate, Thomas E. Watson. Several Populists hoped in vain that the Democrats would drop their vice presidential candidate Arthur M. Sewall, a Maine businessman, from the ticket in favor of Watson.

Although the Bryan-Watson fusion ticket appeared on many state ballots, some states refused to include Watson and listed only the Democratic Bryan-Sewall ticket. Throughout the 1896 campaign Bryan ignored Watson. Consequently, many Populists ended up voting for the Democratic ticket instead of their own. McKinley easily defeated Bryan, collecting 271 electoral votes to Bryan's 176. The Republican candidate also received 7,036,000

popular votes to the Democrats' 6,468,000. The results of the 1896 election sent the People's Party into decline.

Although it continued to nominate candidates until 1908, the People's Party was effectively absorbed by the Democrats. The main contribution of the Populists was the eventual acceptance of their proposals by the two major parties. Their calls for reform of the banking system and national monetary policy, commodity exchanges, and new electoral procedures had a significant impact on American politics. Yet, lingering sectional and racial biases from the Civil War hampered the People's Party. Class bias also existed against a party supported almost exclusively by small farmers. The Populist position of maintaining private property and economic competition for small producers while demanding federal regulation of the national economy was met with derision by large-scale farming interests and the business community. Despite attempts to transform itself into a nationwide political phenomenon, Populism remained a predominantly rural, sectional movement with some power on the local level. In the end the Populists represented the last major agrar-

ian protest movement against an increasingly urban and industrial America.

### Philadelphia Centennial Exposition (1876)

Running from May to November, the Philadelphia Centennial Exposition—a celebration of the nation's first 100 years—was attended by 8 million people. It took place in Fairmount Park, where 236 acres were enclosed for what was officially called the United States International

Main pavilion on the opening day of the Centennial Exhibition in Philadelphia (Library of Congress)

Exhibition. The center of the exhibition was the great Corliss engine, whose geared flywheel and two huge walking beams dominated Machinery Hall. It powered 13 acres of machines spinning cotton, printing newspapers, and pumping water, and it symbolized the nation's industrial growth. WILLIAM DEAN HOWELLS, the novelist, called it "an athlete of steel and iron" and observed that "America is voluble in the strong metals and their infinite uses." Technological innovations especially impressed visitors. These included the new typewriter on which for 50 cents one could have a letter written, a lamp burning electricity rather than gas or oil, and ALEXANDER GRAHAM BELL's telephone. Besides Machinery Hall there were halls devoted to agriculture and horticulture, 24 state buildings, and 37 representing foreign countries. Memorial Hall, a permanent granite building that is now part of the Philadelphia Museum of Art, exhibited paintings and sculptures, including nudes that shocked yet fascinated puritanical Americans.

There was also a Woman's Pavilion. In it, shortly after the Corliss engine was set in motion, a six-horsepower engine powered looms and other machines and printed a weekly magazine, *The New Century for Woman*. Searchers had to go to Canada to find a woman to operate the steam engine. She was Emma Allison of Grimsby, Ontario. Women, who crowded around with questions, found her "no low, vulgar woman, but an educated and accomplished lady." Women not only tended the machines but also were responsible for everything exhibited, from Queen Victoria's etchings to articles of clothing.

The centennial committee planned a special celebration on the Fourth of July at Independence Square. Emboldened by the success of the Woman's Pavilion, suffragists asked to present, but not to read, their special Declaration of Independence for Women. They were turned down, but five suffragists with press cards resolved to read their declaration. Before 150,000 people jammed in the square and following the reading of the Declaration of Independence, SUSAN B. ANTHONY, MATILDA GAGE, and three companions stunned the crowd by marching up to the podium, introducing their declaration, distributing copies, and then proceeding to the musicians' platform, where Anthony read it while Bayard Taylor recited his National Ode from the speaker's platform. Most men present saw no connection between Thomas Jefferson's declaration and that of the women, but for women who could not vote and had difficulty keeping property after marriage, the connection was obvious.

The Centennial Exhibition demonstrated for all the world that America had come of age industrially. It also reminded Americans that although women were more emancipated in their country than elsewhere, they still lacked fundamental political rights and would demand them as effectively as possible.

### *Plessy v. Ferguson* (1896)

After the U.S. SUPREME COURT ruled in 1883 that the CIVIL RIGHTS ACT OF 1875 was unconstitutional, various southern municipalities began to establish separate facilities for whites and AFRICAN AMERICANS. Eight states between 1887 and 1891 enacted laws requiring RAILROADS to maintain separate facilities for the races. Louisiana's version of this statute, enacted in 1890, outraged blacks, who organized a committee to test the constitutionality of the separate-car law the following year. In 1892 Homer Plessy, an African American, purchased a first-class ticket and occupied a seat in the "white" car. Arrested and convicted, Plessy appealed his case in the Louisiana courts and ultimately the U.S. Supreme Court. Albion Tourgee, a Radical Republican and a major supporter of equal rights, defended Plessy. Tourgee argued that denying his client the right to sit in a first-class car was a violation of his rights under the Thirteenth Amendment, which prohibited involuntary servitude, and the Fourteenth Amendment, which guaranteed "equal protection of the laws." Although six of the Supreme Court justices were former attorneys for railroads or corporations closely allied with railroads (and separate cars meant more trouble and expense for the roads), the Court ruled seven to one against Plessy and legitimized the "separate but equal" doctrine not only on railroads but in schools as well.

Justice Henry B. Brown delivered the majority opinion. He noted that the Fourteenth Amendment did not abolish distinctions based on color and was not meant to force social equality between the races. Brown added that separation laws did not stamp the badge of inferiority on blacks because whites were also separated, which did not make them inferior. Brown concluded the majority opinion with the observation that social equality between races was "the result of natural affinities, a mutual appreciation of each other's merits, and a voluntary consent of individuals. . . . Legislation is powerless to eradicate racial instincts or to abolish distinctions based on physical differences" and would only prove counterproductive.

JOHN MARSHALL HARLAN was the dissenting voice. Harlan, a former slave owner and Union officer, leaned on Tourgee's brief and insisted that the "Constitution is colorblind and neither knows nor tolerates classes among

citizens,” that the Thirteenth Amendment eliminated the “badge of servitude” as well as slavery itself, that the so-called “equal” accommodations was a “thin disguise” misleading no one, and that laws “which in fact proceed on the ground that colored citizens are so inferior and degraded that they cannot be allowed to sit in public coaches occupied by white citizens” will certainly create distrust and “arouse race hate.” Harlan concluded that the Louisiana statute was “inconsistent with the personal liberty of citizens, white and black, in that state, and hostile to both the spirit and letter of the Constitution of the United States.”

Southern states would within a few years enact additional JIM CROW (segregation) LAWS to effectively separate the races in schools, playgrounds, concert halls, railroad and bus terminals, movie theaters, opera houses, streetcars, and virtually every form of public facilities. Those laws prevailed in the South until the Civil Rights movement of the 1950s and 1960s forced CONGRESS in 1964 to pass the Civil Rights Act that eliminated the concept of “separate but equal.”

### Plunkitt, George Washington (1842–1924)

*politician*

George Washington Plunkitt, ward boss of New York’s Hell’s Kitchen, was born on “Nanny Goat Hill” on the Upper West Side of Manhattan to Irish immigrant parents. He had little formal education, quitting school at the age of 11, but in time he became smart enough to make politics his profession and shrewd enough to make it pay handsomely. By 1876 he had worked his way up through the ranks to become the Democratic ward leader of the New York 15th Assembly District in Hell’s Kitchen on Manhattan’s West Side. For nearly 50 years Plunkitt dominated the politics of the 15th Assembly District to the point that he once simultaneously held the public offices of magistrate, alderman, supervisor, and state senator.

TAMMANY HALL, arguably the most powerful “political machine” during the Gilded Age, was the Democratic organization that dominated New York City politics throughout the 19th century. Plunkitt supported every Tammany boss from William M. Tweed to Charles F. Murphy. He became well known for conducting business and talking with the press while perched majestically on the bootblack stand at the New York County courthouse.

Speaking frequently in 1905 with a local journalist, William L. Riordon, Plunkitt defended political machines against attacks by reformers, whom he dismissed as quick-fading morning glories. These interviews, which Riordon probably embellished, originally appeared as “Very Plain Talks on Very Practical Politics” in the *New York Evening Post*; they were subsequently published as *Plunkitt of Tammany Hall* and have achieved the status of a political classic. In them, Plunkitt described in amusing detail how he succeeded in politics and accumulated a fortune. The key to Plunkitt’s success was winning and keeping the loyalty of the voters in his district. To do so he attended every wake, wedding, christening, and picnic and provided needy constituents with groceries, a bucket of coal on cold days, legal support, a place to live, or a job. Plunkitt used his access to patronage to find work for the unemployed in city agencies, within the political organization itself, or in local businesses anxious to stay on his good side. Plunkitt became wealthy not by stealing but by what he called “honest graft.” Plunkitt made money by acting on inside information about proposed public improvements to which he was privy.

See also MACHINE POLITICS; TWEED RING.

### political parties, third

Two major parties—the REPUBLICAN PARTY and the DEMOCRATIC PARTY—have dominated American politics. Third parties, however, have occasionally been organized by advocates of an issue or group they feel the major parties have ignored. No third-party candidate has ever won the presidency, although a few have been elected to the Senate and the House of Representatives, and more have had success at the state and local level. More significantly, third parties, by playing the part of the spoiler, force their agendas (although often watered down) onto the platforms of either the Democrats or the Republicans, who are anxious to prevent the defection of key constituencies.

In the late 19th century, third parties formed around issues related to political reform, agrarian discontent, class conflict, and prohibition. The LIBERAL REPUBLICAN PARTY was organized prior to the 1872 election by Republicans who were disturbed by the course of the Ulysses S. Grant administration. They favored low tariffs, wanted CIVIL SERVICE REFORM, were anti-inflation, and had soured on Radical Reconstruction. The Liberal Republican movement did not survive the election of 1872. In part it self-destructed due to the ludicrous nomination of Horace

Greeley—a high tariff, anti-civil service reform man—for the presidency, but also because Grant and the Republican CONGRESS undercut the Liberals by adopting both tariff reductions and civil service reform before the election and then abandoning them in 1875.

The most notable Gilded Age third parties were born of agrarian discontent and focused on the CURRENCY ISSUE. The GREENBACK-LABOR PARTY (National Independent Party) was organized in the 1870s and promoted the expansion of the currency by issuing more paper money (“greenbacks”) and rejecting the gold standard in order to ease the financial burdens of farmers and industrial workers. The Greenbackers were succeeded in the 1890s by the PEOPLE’S PARTY (Populists), which promoted currency expansion through the unlimited coinage of silver at a 16-to-1 ratio with gold (see FREE SILVER MOVEMENT). The Populists also advocated low interest rates to farmers based on crops stored in “subtreasuries” (warehouses), favored government ownership of RAILROADS and utilities, a graduated income tax, an end to the NATIONAL BANKING SYSTEM, and the direct election of U.S. senators. The Democratic Party, however, adopted Free Silver in 1896 and forced the Populists to choose between maintaining their party or fusion with the Democrats. They chose fusing and their party survived a few years in the Midwest before expiring. The Populists ultimately succeeded in that most of the reforms they advocated were adopted by the Progressives and the New Deal in the 20th century.

Among the other third parties to emerge at the end of the 19th century was the PROHIBITION PARTY, which sought the enactment of legislation outlawing the manufacture and sale of alcoholic beverages. It was the spoiler for the Republican Party in 1884 when enough upstate New York Republicans deserted to vote the Prohibitionist ticket, enabling the Democratic candidate, GROVER CLEVELAND, to win the state and with it the presidency. By the early 20th century politicians in both parties supported Prohibition. Some third parties like the SOCIALIST LABOR PARTY, established in 1874, were so small that the major parties could and did ignore them.

## population trends

The population of the United States almost doubled from 40 million in 1870 to 76 million in 1900. Its growth was

rapid during the Gilded Age, but not as fast as in previous 30-year periods. Although overall growth was beginning to level off, the late 19th century was a period of enormous population shifts in the United States. The influx of immigrants from Europe, among whom there were a large number of young single males, accounts for the fact that in 1870 there were virtually the same number of males and females, but in 1900 there were more than 1.5 million more men than women in the United States. European IMMIGRATION also accounts for the percentage decline of nonwhites from 13.7 percent in 1870 to 12 percent in 1900. The annual number of immigrants fluctuated with economic conditions. Large numbers came in prosperous years (788,992 in 1882) and fewer in hard times (138,469 in 1878).

Within the United States two major trends occurred simultaneously: the move west that more than doubled the number of farms from 2.7 million in 1870 to 5.7 million in 1900, and a nationwide move from farms to cities. In 1870 for each city dweller there were three persons living in rural areas, but by 1900 there were two city dwellers for three persons living in rural America. Urban population tripled from 9.9 million to 30.2 million, while rural population grew from 28.7 million to 45.8 million. Major established cities like New York more than doubled in population, and newer cities like Chicago multiplied more than five times from over 300,000 in 1870 to 1.7 million in 1900. States west of the Mississippi from 1870 to 1900 gained approximately 11.4 million people born east of the Mississippi, and during the same period 1.4 million southerners took up residence in the North. Most of those southerners who headed north were white, since the black population of the North increased by only 428,000 from 1870 to 1900. The enormous black migration from southern farms to northern cities came in the 20th century.

Americans were also a restless people constantly on the move. Quite apart from moving a long distance west or north, there was enormous geographic mobility within regions and between and within cities. Those who were unsuccessful would move a relatively short distance to a different farm or to another town in search of a better job. In places as different as Newburyport and Boston, Massachusetts, Omaha, Nebraska, and Poughkeepsie, New York, workers moved with great frequency, with as many as half of the unskilled moving in a 10-year period. There was also an enormous amount of moving within cities as tenants found better housing. With many leases in New York City expiring on May 1, it was called “moving day” and was a holiday of sorts, since the streets and sidewalks were so jammed with carts, wagons, and possessions that normal business could hardly be conducted. A remarkable number of Gilded Age Americans, especially those without real estate, were on the move.

**populism** See PEOPLE'S PARTY.

**Populist Party** See PEOPLE'S PARTY.

**Powderly, Terence Vincent** (1849–1924) *labor leader*

Terence Vincent Powderly was the 11th of 12 children born to Terence and Margery Powderly. After his birth on January 22, 1849, he was raised in Carbondale, Pennsylvania, and he quit school in 1862 to become a switchman for the Delaware & Hudson Railroad. Four years later he became an apprentice machinist for the same company. Laid off immediately after he finished his three-year apprenticeship, he took a job with the Delaware, Lackawanna, & Western Railroad Company (DL&W) in nearby Scranton, Pennsylvania.

While at the DL&W he joined the Machinists and Blacksmiths International Union and quickly became an officer of his local. Although he was not militant, he was fired and blacklisted in 1873 for his union activities. Unable to find work in Scranton, he took advantage of his union's job-referral service to secure a position in Oil City, Pennsylvania. While in Oil City he became involved in the broader labor reform movement. He returned to Scranton the following year, where he helped organize the local GREEN-BACK-LABOR PARTY. In 1878 he began the first of three consecutive terms as mayor of Scranton.

The following year Powderly succeeded Uriah Stephens as grand master workman (president) of the KNIGHTS OF LABOR (Knights), a position he would hold for 14 years. In his vision, the Knights would serve as an educational vehicle destined to replace the wage system with producer cooperatives. He advocated government ownership of public utilities, the abolition of child labor, workplace safety laws, and the exclusion of Chinese immigrants. Once a member of the Father Mathew Total Absti-

nence and Benevolent Union, he denounced alcohol as a major contributor to working-class poverty. He opposed strikes, believing that immediate concerns such as wages and working hours could be resolved best through arbitration. He issued a secret circular directing his members to withhold their support of the general strike called in support of the eight-hour working day. Avoiding the appearance of radicalism, he twice opposed resolutions expressing sympathy for the anarchists convicted of the Haymarket bombing at the Knights General Assembly in 1886. Yet he privately believed they were unjustly condemned.

Nevertheless, the Knights declined rapidly following the HAYMARKET RIOT. As a result, Powderly reached out to agrarian reformers. He and other leaders of the Knights attended the convention of the Southern Farmers Alliance, where they agreed to coordinate lobbying activities in Washington and support alliance candidates, but he was reluctant to ally the Knights with the PEOPLE'S PARTY (Populist Party) in 1892. The following year, disappointed agrarians joined with members of the SOCIALIST LABOR PARTY to remove him as grand master workman, and in 1894 he was expelled from the Knights.

That year, Powderly, who had previously studied law, was admitted to the Lackawanna County bar at Scranton. In 1897, having campaigned for WILLIAM MCKINLEY, he was appointed U.S. commissioner general of IMMIGRATION, but he was removed by Theodore Roosevelt in 1902 because of corruption on Ellis Island. Roosevelt, however, in 1906 gave him a position in the Department of Commerce and Labor, shifting him the next year back to the Bureau of Immigration, where he served until his death on June 24, 1924.

—Harold W. Aurand

**Powell, John Wesley** (1834–1902) *explorer, mapmaker, geologist, ethnologist*

Powell was born in Mount Morris, New York, on March 24, 1834. The son of a Methodist preacher and farmer, Powell moved with his family to the Midwest, where he developed a taste for natural history. Although educated intermittently at colleges in Illinois and Ohio, without earning a degree, Powell pursued his avocation. He collected specimens widely and, on the eve of the Civil War, was secretary of the Illinois Society of Natural History. Powell led Union artillery units at Shiloh (where he lost his right arm below the elbow), in the Vicksburg and Atlanta campaigns, and at Nashville before resigning on disability as a major in January 1865.

Powell then began teaching geology and natural history at Illinois Wesleyan University and resumed his curatorial work for the natural history society. Summers spent in the central Rocky Mountains with his wife and cousin Emma Dean, whom he had married in 1862, led to real exploration. On May 24, 1869, Powell and his nine-man team, supplied in part by army rations, began a daring exploration by boat down the Green and Colorado Rivers that ended successfully on August 30 below the Grand Canyon, except for three men who did not return. With funds from CONGRESS, Powell and a new team made a second, more scientific voyage downriver in 1871. His account of these twin adventures, published in 1875, merged events from both trips.

During the 1870s Powell, expanding on his river explorations, surveyed areas on and near the Colorado Plateau, first under the auspices of the Smithsonian Institution and then within the Department of the Interior. From 1877, Powell's U.S. Geographical and Geological Survey of the Rocky Mountain region operated south of the 42nd parallel as part of the Interior Department's work to map and assess the West's lands and resources by triangulation surveys that used a rectangular system, uniform scale, and contour topography. By 1879 Powell and his colleagues had contributed significantly to understanding the development of mountains and valleys, to ethnology, and to classifying the public lands by their nature and use. Their interpretations of canyons as "antecedent," "consequent," or "superimposed" reflected the dynamic relations between rivers and the geologic structures they crossed. Powell also supported a more rational use of the West's lands and limited waters and a wiser, humane policy toward its native peoples.

In the debates after 1873 about improving the federal mapping and scientific surveys of the public lands in the West, Powell favored consolidation under civilian control. In March 1879 Congress and President RUTHERFORD B. HAYES terminated Powell's and the two other competing western surveys. They established in their place the U.S. GEOLOGICAL SURVEY (USGS) to scientifically classify the public lands and to aid mineral industries and the nation's economy by examining the geology, minerals, and products of the national domain. Powell successfully supported CLARENCE (Rivers) KING for USGS director. Powell moved back to the Smithsonian to lead the Bureau of Ethnology (BE), established by the same legislation; served with King on the Public Lands Commission; and was elected to the National Academy of Sciences. When King resigned in March 1881, he recommended Powell as his successor.

Powell's goals and methods in science and its administration differed widely from King's. Powell, who represented an older, less-specialized, and often self-taught

tradition in science in America, believed that everything possible must be learned about a subject before the information gained could be applied to solving problems. This view paralleled his looser approach to management, one that allowed the USGS staff to choose their own subjects for study. In 1882, to advance the national geologic map sought by King, Congress authorized USGS activities nationwide. Under this rubric, Powell remade the USGS into a bureau of topographic mapping and basic research in geology, but this change came at the expense of the mandated studies of mineral resources. Congress increased USGS funding in the 1880s, until the legislators and their constituents grew dissatisfied with the paucity of practical results useful in meeting the nation's economic and educational needs and pressed Powell to reform. That drive culminated in the early 1890s after the USGS failed to respond to a renewed monetary crisis and Powell's Irrigation Survey (IS) refused to recommend sites whose selection would have reopened the public lands to entry and released federal-dowry lands to six new states. Congress and President BENJAMIN HARRISON discontinued the IS and selectively slashed the USGS budget, reducing Powell's salary and forcing him to fire some of its best geologists. Powell resigned in 1894.

Powell then underwent a needed operation on the stump of his arm; recovering, he remained chief of the BE. He continued to promote the reclamation of arid lands by wise irrigation and land use and to recommend that counties in new states be organized by drainage districts. Powell summarized his philosophy in *Truth and Error or the Science of Intellection* (1898). He died at his retreat in Haven, Maine, on September 3, 1902, less than three months after the passage of the National Reclamation (or Newlands) Act and the establishment of the Reclamation Service within the USGS.

—Clifford M. Nelson

## pragmatism

Pragmatism is a philosophy that significantly influenced education and social reform movements in the period from 1870 to 1900 and beyond. Actually, some scholars contend that pragmatism is not a philosophy but rather a way to think about a problem, create possible solutions, and then test or evaluate them against their consequences. Pragmatism was

a response to the seemingly fixed and fatalistic evolutionary determinism of Herbert Spencer and WILLIAM GRAHAM SUMNER. Rather than accept and adjust to their rigid concept of evolution, pragmatists used the language of evolution and argued that humans were “organisms” who lived in and could change their environment. People were not helpless and passive in the throes of a master law; rather, through their minds and behavior they could alter their circumstances and use knowledge for reform and progress. Pragmatists saw the world as dynamic, full of possibilities, and not governed by eternal, cosmic moral laws with fixed behavioral standards. There was no final analysis, for all analyses are continuously criticized and revised. This belief system won favor with many Americans living through the last three decades of the 19th century as the American landscape and its beliefs were drastically affected by industrialization, urbanization, the growth of a national integrated market and COMMUNICATION system, and unprecedented large waves of IMMIGRATION.

CHARLES SANDERS PEIRCE (1839–1914) was a very influential pragmatist philosopher. Trained as a mathematician and astronomer, he emphasized the presence of chance and possibility in nature. Writing in 1878, he argued that our ideas become clearer when people understand that their knowledge comes from human experience and activity. The meaning of an idea did not come from an ancient, ethical, or moral belief but rather came from our understanding and giving value to its practical, immediate effects. Truth was derived from experience and could be best approached by rigorously testing hypotheses with the tools of logic. He had, in his words, a “laboratory habit of mind.” Peirce, however, was difficult to understand and had little direct influence on the public at large.

In contrast, WILLIAM JAMES, who was influenced by Peirce, wrote with clarity and popularized pragmatism. Reflecting his training as a psychologist, James emphasized the role of the human will and the personal and emotional satisfaction that ideas gave the individual. Ideas—even religious beliefs—were true if they worked. People should judge ideas by their factual results. But by that test, what is true at one time and for one person may not be true for another person at another time. Essentially, ideas and truths are on trial and subjected to constant evaluation and reshaping. James perceived that the universe was open and an “unfinished experiment,” and he believed that people should not follow abstract, previously agreed upon solutions to problems. If truth was the goal, truth was what reality brought to an idea. The idea’s value came from its utility. Threaded through his beliefs was the central theme that humans, through their intelligence, could be actively involved in creating and managing their lives. They simply had to carefully learn from their daily experiences and constantly test their behavior against its results. If one way of

doing something did not work, then change was called for. If one result did not satisfy, then one should recognize the situation and find other experientially tested means to meet personal or organizational goals. This philosophy made sense in a society whose credo was that self-made individuals, through hard work and a bit of luck, could achieve their dreams.

While James’s stress was on the personal and emotional, John Dewey, a late 19th- and early 20th-century educational philosopher and teacher-educator, applied pragmatic principles to social issues. Since society was unfinished, the experimental method should be utilized to solve social problems. Study the history of a problem, research solutions, try them out, and adjust them to make them work. Dewey’s influence in the classroom was and still is enormous. He taught that teachers should always know the needs and interests of students. They should not impose morals, knowledge, or skills on children. While children had to learn reading, writing, computing, and civics, they needed to construct a path of learning from their own circumstances to these unknown skills and beliefs. If children in school learned how to solve problems, as adults they might transfer these experiences into political life and reform institutions.

In other applications of pragmatism, educators in universities conducted research on reforming electoral systems, civil services, taxation, and governmental services. Specialists in agriculture carried their research from universities into the villages and fields of American farmers, showing families how they could raise productivity and improve their lives. For many Americans, politics, government actions, and human relationships were not determined by unchangeable economic and social laws or absolute moral standards. For them, human needs and the best methods for fulfilling them were informed by pragmatic ethics.

## presidency, the

The powers exercised by presidents increased in the late 19th century. Until about 1870 the Whig concept of a passive chief executive (a reaction to the vigorous presidency of Andrew Jackson) prevailed. The president was expected to follow the lead of CONGRESS and simply execute the

laws it made. He could suggest but not dictate legislation, and he should resort to the veto only in extraordinary cases. Indeed, members of Congress interfered with the administrative responsibilities of the president by dictating whom he should appoint as the department heads that formed his cabinet as well as civil servants in their districts and states. The president was to be dignified and above the sordid business of politics. Neither the Civil War nor Reconstruction appreciably changed the presidency. Necessity forced Abraham Lincoln to expand presidential war powers temporarily, but he deferred to Congress in other matters, while Andrew Johnson not only lost the battle with Congress over reconstructing the Union but also damaged the prestige of his office.

Yet, whatever political experience, theoretical ideas, or personality traits presidents possess, they all make some effort, with varying success, to defy Congress and enhance their power. Ulysses S. Grant, upon taking office in 1869, selected his cabinet without consulting Republican congressional leaders, but soon, at their behest, he replaced the conspicuous political independents with pliant party men. On the other hand, Grant influenced the Senate to depose Charles Sumner, chairman of the Senate Foreign Relations Committee, when he challenged Grant's control of FOREIGN POLICY, and in 1874 Grant obeyed his hard-money conscience and vetoed the Inflationary bill (which actually had very little inflation in it).

RUTHERFORD B. HAYES, however, consistently tried to enhance the power of the executive. His choice of a cabinet outraged party leaders, and his attack on "senatorial courtesy" succeeded to the point that members of Congress suggested but did not dictate appointments. Hayes also, in the "battle of the riders," preserved the executive veto power by vetoing several appropriations bills with additions that were designed to force his acceptance of unwanted legislation. The veto messages, as Hayes wished, aroused public opinion. Hayes also travelled widely, spoke frequently on policies but not politics, and identified his presidency with issues as contrasted with the congressional orientation toward party organization. JAMES A. GARFIELD after long service in Congress was inclined to defer to his former colleagues, but to control his appointments to office he fought and again defeated senatorial courtesy. The adoption of CIVIL SERVICE REFORM during the CHESTER A. ARTHUR administration reduced the men and money available for political parties and would in time enhance the control of issue-oriented presidents over their party.

Presidential power did not grow during GROVER CLEVELAND's first term. Immersed in the minutiae of office, he specialized in scrutinizing and vetoing private pension bills. Although in 1887 he signed the Interstate Commerce Act and the DAWES SEVERALTY ACT, he shaped neither, and while he called for tariff revision he

did not fight effectively for it. In contrast, his successor BENJAMIN HARRISON did influence much of the legislation passed by the "billion dollar Congress," including the SHERMAN ANTITRUST ACT (1890) and the reciprocal feature of the MCKINLEY TARIFF (1890). And the economic depression following the panic of 1893 inspired Cleveland in his second term to convince a reluctant Congress in 1894 to repeal the Sherman Silver Purchase Act of 1890.

WILLIAM MCKINLEY, much like his Civil War commander Rutherford B. Hayes, was not dominated by Congress on either domestic or foreign policy issues and cultivated public opinion. Responding to his wishes, Congress raised rates and included the reciprocity feature in the Dingley Tariff (1897). He was not stampeded into a declaration of war against Spain in 1898; he personally directed the war effort; and he made the decisions that acquired overseas possessions in the Pacific and the Caribbean and paved the way for the construction of an isthmian canal. In his relations with Congress, his conduct of foreign policy, his enlarged White House staff, and his use of the press, McKinley paved the way for powerful 20th-century presidents.

### presidential campaigns (1872–1900)

Just as the PRESIDENCY was evolving during the Gilded Age, so, too, were presidential campaigns. In the 1860s candidates for president were supposed to be above participating in the campaign, even though most of them had devoted a lifetime to securing the nomination from their party's national convention. Republican candidates needed a simple majority, but Democrats had to have a two-thirds majority to get the nomination. In trying to identify their candidate with the selflessness and purity of the legendary Cincinnatus, who abandoned the plow to heed the call to save the Republic of Rome, conventions would send a delegation to the nominee's home to inform him of his selection. The candidate would respond with a letter of acceptance stressing those planks in the party's platform (which the convention also adopted) that the candidate wished to be identified with and on which he believed the campaign should be run. From that point on the nominees remained in virtual seclusion and were restricted to giving behind-the-scenes advice. Campaigns were financed by assessing civil servants (whose jobs depended on the outcome of the election) a percentage of their annual salary, and they were relied upon to get out the vote. National committees were nominally in charge of the campaign, but because they had limited funds and were weak, virtually independent state

Year	Candidate	Party	Popular Vote (%)	Electoral Vote
1872	Ulysses S. Grant	Republican	3,596,745 (55.6)	286
	Horace Greeley	Democratic	2,843,446 (43.9)	66
1876	Rutherford B. Hayes	Republican	4,036,572 (48.0)	185
	Samuel J. Tilden	Democratic	4,284,020 (51.0)	184
1880	James A. Garfield	Republican	4,449,053 (48.3)	214
	Winfield S. Hancock	Democratic	4,432,035 (48.2)	155
1884	Grover Cleveland	Democratic	4,874,986 (48.5)	219
	James G. Blaine	Republican	4,851,981 (48.2)	182
1888	Benjamin Harrison	Republican	5,444,337 (47.8)	233
	Grover Cleveland	Democratic	5,540,050 (48.6)	168
1892	Grover Cleveland	Democratic	5,554,414 (46.0)	277
	Benjamin Harrison	Republican	5,190,802 (43.0)	145
	James B. Weaver	People's	1,027,329 (8.5)	22
1896	William McKinley	Republican	7,035,638 (50.8)	271
	William J. Bryan	Democratic	6,467,946 (46.7)	176
1900	William McKinley	Republican	7,219,530 (51.7)	292
	William J. Bryan	Democratic	6,356,734 (45.5)	155

committees ran the campaign in their states. Campaigns were enormously entertaining, with spellbinding speakers, roasted oxen at barbecues, brass bands, songs, chants, brawls, and torchlight parades with illuminated windows along the right of way. No sporting or theatrical event could match the spectacle of a Gilded Age political campaign. Election statistics show that usually the major parties were evenly matched (see above).

Compared with the 1860s, presidential candidates in 1900 were more active; national committees were more effective; contributions of money and time by civil servants were greatly diminished; and the donations and influence of big business were greatly increased in campaigns. In 1872 Ulysses S. Grant did not campaign against his opponent; Horace Greeley, editor of the *New York Tribune*, however, broke tradition and delivered speeches to large audiences, but to no avail. Although nominated by Liberal Republicans who were disillusioned with Grant and Democrats who realized that Greeley was their only hope to defeat Grant, neither group gave him wholehearted support. He was not enough of a reformer for many Liberal Republicans, and many Democrats could not forgive him for his previous attacks on their party.

Because of hard times following the panic of 1873, corruption in the Grant administration, and the ebbing of Civil War passions, Republicans in 1876 had an uphill battle. They nominated Hayes, a war hero with a reform

reputation, while the Democrats nominated Tilden, who had fought the corrupt TWEED RING in New York City. The campaign was conducted in a conventional manner until the late hours of election day. Although Tilden seemed on his way to victory, Daniel Sickles at Republican headquarters calculated that if Hayes could carry Louisiana, Florida, and South Carolina—states where Republicans controlled the election machinery—he would win the election by one electoral vote. He dispatched telegrams to Republicans to hold those states for Hayes. Republican election boards in these states, as well as in other states, determined the official vote and could disqualify returns where people were prevented from voting. Threats and violence did occur, and the Republican-dominated returning boards threw out enough votes, some fraudulently, to carry those states for Hayes.

With Republican fraud countering Democratic violence, it is impossible to tell who would have won in a fair election. Republican governors certified the votes of Republican electors, but Democrats also claimed to have carried the three disputed states and sent their electoral votes to Washington. The Constitution requires that the electoral votes be counted by the president of the Senate in the presence of a joint session of CONGRESS. Since the presiding officer of the Senate was a Republican and the Democrats controlled the House of Representatives and, with that, a majority in a joint session, Congress deadlocked over who would decide what votes to count. It resolved that

question with a compromise most congressmen both disliked and favored.

The Electoral Commission Act (1877) created a 15-member commission to make the difficult decision. It was designed to be composed of seven Republicans and seven Democrats and one independent, but simultaneously with its passage, the independent—Justice David Davis—was elected to the Senate with Democratic votes, disqualified himself, and a Republican took his place. The commission decided by a partisan eight-to-seven margin not to question the official certified returns and awarded the disputed states to Hayes.

By recessing, the Democratic House delayed the count and threatened to plunge the nation into chaos with no president on inauguration day. The Democrats hoped to force the withdrawal of troops supporting Republican state governments in the South and, to a lesser extent, to gain

railroad subsidies for the South. There were negotiations, but no concessions were made beyond what Hayes promised in his letter of acceptance. He would withdraw the troops when the civil and voting rights of black and white Republicans were respected. The count was completed on March 2, 1877, not because of a negotiated bargain but because the high-handed rulings of the Democratic Speaker of the House Samuel J. Randall choked off the filibuster. Randall was willing to use the threat of chaos in an attempt to gain concessions but not to risk the actual chaos of no president on inauguration day. To avoid any future wrangling by Congress over electoral votes, it passed the 1887 Electoral Count Act, which required it to accept the certified returns from the states and, in effect, ratified the decision of the 1877 electoral commission.

In 1880 with the Republican convention deadlocked by STALWART supporters of Grant, so-called HALF BREED

Poster showing the Democratic nominees, Grover Cleveland for president and Thomas Hendricks for vice president, in the 1884 elections (*Library of Congress*)

supporters of JAMES GILLESPIE BLAINE, and supporters of JOHN SHERMAN, it turned to a dark horse, James A. Garfield. The Democrats ran a distinguished Civil War general, Winfield Scott Hancock, whose political views were unknown. Relying on party organization rather than issues, Garfield's letter of acceptance was equivocal and retreated on CIVIL SERVICE REFORM, and during the campaign he encouraged the assessment of civil servants. Garfield calculated correctly that to win he had to carry New York, and to activate ROSCOE CONKLING's New York Republican machine, he journeyed to New York, met with Conkling's lieutenants and other leading Republicans, and, at his ambiguously agreeable best, motivated them with vague promises of patronage. The machine carried New York for Garfield and with it the election, although his plurality over Hancock was razor thin.

In 1884 the Republicans did choose Blaine, while the Democrats picked GROVER CLEVELAND as their nominee. Blaine, popular with rank-and-file Republicans, had identified himself with the protective tariff and a vigorous foreign policy. Cleveland lacked the qualities associated with a successful politician; he was brutally honest, frugal with public money, undramatic, ungracious, obstinate, admired for his enemies rather than his friends, not a Union veteran, and a bachelor. His contrariness attracted reformers and political independents, who helped elect him governor of New York in 1882, and the Democrats hoped they would help make him president. The 1884 campaign was vituperative and close. It pitted the personal morals of Cleveland (he was possibly the father of an illegitimate son) against the public morals of Blaine, who had accepted \$64,000 from the Union Pacific Railroad for some worthless bonds. Blaine broke with tradition and campaigned vigorously, but MUGWUMP reformers deserted the Republicans, and Cleveland carried New York by 1,100 votes and won the election.

In 1888 Cleveland, calling for tariff revision, ran for reelection, but although he had a plurality of popular votes he lost New York and was defeated in the electoral college by BENJAMIN HARRISON. In 1892, however, Cleveland decisively defeated Harrison in a campaign that again stressed the tariff.

The severe depression following the panic of 1893 ended the near equilibrium between Republicans and Democrats and realigned the major parties. The shock of hard times was so severe that the Democrats repudiated Cleveland and his hard-money views and in 1896 nominated WILLIAM JENNINGS BRYAN on a platform that stressed the inflationary free (unlimited) coinage of silver at a 16-to-1 ratio with gold. The Republicans nominated WILLIAM MCKINLEY on a platform that stressed a protective tariff and remaining on the gold standard. Unlike past contests, both candidates campaigned effectively, if

differently. Bryan traveled 18,000 miles by rail and spoke to hundreds of thousands of voters, while McKinley stayed at home but spoke to almost as many who arrived in several delegations daily at his front porch. To each group he gave a short speech tailored for them, extolling the virtues of protectionism and the dangers of Free Silver (see FREE SILVER MOVEMENT). Republicans raised millions of dollars largely from big businessmen and blanketed the country with 250 million pamphlets, while the Democrats could raise only thousands of dollars. McKinley won handily; the Republicans had become the dominant party and would remain so for three decades. The 1900 campaign featured the same two candidates, and the results confirmed the profound shift that had taken place. McKinley, riding the crest of popularity as a result of returned prosperity and a victorious war, triumphed even more decisively over Bryan, who had embraced anti-IMPERIALISM.

### professional organizations, rise of

As Gilded Age America became more urbanized, industrialized, and specialized, people identified with their occupation or profession more than with their town or section. Organizations reflecting that identification grew across political divisions. Skilled workers formed “international brotherhoods” of craft unions that endured and in 1886 organized the AMERICAN FEDERATION OF LABOR (AFL). In an effort to destroy those unions and in recognition of their own “community of interest,” businessmen in 1895 organized the National Association of Manufacturers.

The emerging middle class provided the most salient examples of strong professional cohesion in medicine and law. Although the American Medical Association (AMA) had existed since 1846, advances in medical science fostered a drive for more effective organization. In 1870 the sick were better off avoiding the average medical doctor, who was still blistering and bleeding patients and spreading disease with his unwashed hands. By 1900 a revolution had occurred in medical knowledge thanks to the discovery by European scientists that bacteria caused anthrax, tuberculosis, cholera, and other infectious diseases and their realization that antiseptic surgery saved lives. Aware of the new discoveries and the urgent need to apply them universally and to rid their profession of quacks, American doctors in the 1890s organized locally and in 1901 reorganized the AMA.

The organization of lawyers was not as dramatic as that of medical doctors but was also rooted in lawyers' desire to improve the standing and quality of their profession. Few Gilded Age lawyers had been to law school, and most lawyers were poorly trained. After "reading law" in a lawyer's office, which often meant running errands, rather than studying, and passing a perfunctory oral examination by court-appointed lawyers, they were admitted to the bar. Ashamed of their profession as a whole, distinguished lawyers took steps to improve it. In the 1870s they first organized local and state bar associations and in 1878 the American Bar Association, and they pressed for better-trained law students (preferably in law schools) and for stringent, statewide examinations for admission to the bar.

The teaching profession remained unorganized except for college-level teachers, who along with school administrators dominated the National Education Association in the Gilded Age. On the grade-school level small rural schools predominated, where untrained young women and men with little more than a high school education often taught before raising a family or entering another profession. Meager teacher training and short tenures discouraged professional organization until the 20th century.

Higher EDUCATION did play a major role in the organization of scholarly disciplines, as did the nationalizing Civil War experience. In 1865, after the war ended, a combination of reformers and scholars established the American Social Science Association (ASSA). Dividing its interests into four general areas—education, public health, jurisprudence, and the economy—its object was both to study and reform society. These divisions reflected the broad-ranging interests of scholars at the beginning of the Gilded Age, when for example, the boundary between history and political economy was vague and easily crossed. With sharper lines separating the social sciences in the 1880s and dissertations focusing on narrower topics, scholars became more specialized and established organizations for their disciplines. The American Historical Association was founded in 1884 and the American Economic Association in 1885. The founding of the American Political Science Association in 1903 and the American Sociological Society two years later left the ASSA a "hollow shell," with little connection to the academic world.

Developments in the sciences paralleled those in the social sciences. The American Association for the Advancement of Science, established in the 1840s, was joined in the Gilded Age by more specialized organizations. The vast increase in knowledge led scholars to concentrate in fields such as chemistry, geology, and physics. The universities, led by Harvard, Yale, and Johns Hopkins, became centers

of research and specialization, with each discipline establishing its own association. The American Chemical Society was founded in 1876, the Geological Society of America commenced publishing bulletins in 1889, and in 1892 the American Psychological Association was established. Although the Gilded Age produced CHARLES SANDERS PEIRCE, who excelled in chemistry, physics, and astronomy; CHARLES ELIOT NORTON, steeped in both literature and the fine arts; and GEORGE PERKINS MARSH, who was an architect, an etymologist, and an ecologist, the day of the generalist was fast disappearing.

### progressivism in the 1890s

The late 19th century was a period of increased industrialization, urbanization, and IMMIGRATION in America. These economic and social changes resulted in inequities and, at their worst, evils that produced tensions within American society. Between 1889 and World War I, a large number of middle-class, college-educated Americans were aware that for many the "promise" of America was not realized, and they embraced the ideas that became known as progressivism. They shared in the belief that a new response was needed to address the economic and social problems facing American society in the late 19th century. Far from having a hard-and-fast program, progressivism was a diverse collection of reform movements, each aimed at renovating or restoring American society, its institutions, and its values.

The influx of new immigrants into the United States as well as a general rural-to-urban population trend during the 1880s and 1890s placed a great burden on the nation's major cities. Overcrowded tenements, poor sanitation, and inadequate health services made many immigrant communities unhealthy places to live. In the 1890s the SETTLEMENT HOUSE movement, begun in the United States by Jane Addams and Ellen Gates Starr, the cofounders of Hull-House (1889), was at the vanguard of progressive reform aimed at bettering the lives of the nation's immigrant populations. The settlement-house workers were mostly college-educated, middle-class women who

provided immigrants with medical services, citizenship courses, counseling or vocational training, emergency relief, assistance in finding employment, and lessons in cooking, hygiene, and English. These services were designed not only to improve the immigrants' living conditions but also to provide them with the means necessary to assimilate into American society and become participating citizens. In addition, ALFRED TREDWAY WHITE, with his model tenement HOUSING in Brooklyn, and JACOB RIIS, with his reporting on slum conditions, began a housing reform movement.

Another aspect of the progressivism of the 1890s was moral reform. The crusades against prostitution and alcohol consumption reached a new level of intensity in the 1890s. Those involved in the anti-prostitution and Prohibition movements were a diverse group of business leaders, politicians, social workers, feminists, and the clergy. Prostitution was seen as a product of the increased poverty found in many of the nation's overcrowded cities, but the demand for it owed much to the large percentage of young men among immigrants. Prostitution was connected to drunkenness and the saloon culture that perpetuated it. Other problems connected to it were unemployment, industrial inefficiency, a large number of work-related accidents, violence, health problems, urban poverty, and political corruption. To combat these related evils, progressives advocated the prohibition of the manufacture and sale of alcoholic beverages.

Progressives in the 1890s also advocated political reform on all levels of government. Progressive reformers grew despondent over what seemed to them a government system controlled by corrupt bosses and party hacks that used politics to enrich themselves at the expense of the public. On the local and state levels, progressives led efforts to reform the structure of municipal government, increase accountability of city officials, reduce transit fares, obtain government regulation of public utilities, and implement the secret ballot. They also argued for the right of citizens to initiate legislation as well as nominate and recall judges. At the national level, the progressives supported antitrust laws, federal conservation measures, lower tariffs, a federal graduated income tax, woman suffrage, the direct election of U.S. senators, and a reform of the NATIONAL BANKING SYSTEM that would eventually lead to the creation of the Federal Reserve System.

## Prohibition Party

Efforts to prevent the consumption of alcohol have generated intense political conflict in the United States. Temperance had been a major reform movement in the antebellum years, mobilizing large numbers of Americans in a crusade to persuade individuals to give up alcohol and, through legislation, prevent them from drinking. Prior to the Civil War, slavery eclipsed the temperance/prohibition issue, but during the 1870s it experienced a major resurgence. The public was concerned over the large number of saloons, their unwholesome influence in local politics, and their links to gambling, prostitution, public drunkenness, and violence. In 1873 the “Women’s war” broke out across the nation as thousands of women marched to saloons and demanded that saloon keepers give up their businesses. Individual reformers such as Carry Nation lobbied public officials for temperance and prohibition. But it was the Prohibition Party, the Anti-Saloon League (ASL), the WOMEN’S CHRISTIAN TEMPERANCE UNION (WCTU), and several influential religious organizations that stood at the forefront of the prohibition campaign in the late 19th century.

Under zealous and determined leaders, prohibition groups worked hard to end the production, sale, and consumption of alcoholic beverages. Drinking was held responsible for some of the problems facing American society in the last two decades of the 19th century. Women were at the forefront of the Prohibition movement because of the large number of drunkards who abused their wives and children. Business owners blamed alcohol for industrial inefficiency and the high rate of work-related accidents. Employees often missed time because of drunkenness or came to work intoxicated and performed poorly at their tasks. Drunkenness and the saloon culture that perpetuated it were linked to violence, unemployment, health problems, urban poverty, and the corrupt practices of big-city political machines. Prohibition was viewed as a major step toward moral reform in America.

The Prohibition Party provided a voice for temperance and prohibition in national electoral politics. Its members called for the enactment of legislation outlawing the manufacture and sale of alcoholic beverages. The party was founded in September 1869 by delegates from 20 states at a national meeting held in Chicago. It drew its support mostly from Protestant, native-born, small-town,

Currier and Ives print showing a young woman as a warrior for temperance, 1874 (*Library of Congress*)

rural Americans. But some native-born, middle-class Protestants living in the nation's major cities also joined the party. In the main, its members were recruited from the Republican Party. In its crusade against alcohol, the Prohibition Party played upon the prevalent antiurban and anti-immigrant prejudices in late 19th-century America. The saloons in the slums were an inviting and fruitful target. Prohibitionists often associated urban and immigrant life with a weakening of morals that could eventually threaten American democracy.

In 1872 the Prohibition Party participated in a presidential election for the first time, but its candidate received only 5,600 votes. In 1884, however, the party's presidential candidate John P. St. John garnered 150,369 votes, enabling the Democrats to triumph, and in 1888 Clinton B. Fisk received nearly 250,000 votes. The Prohibition Party polled its highest vote total of 264,133 in the presidential election of 1892 when it ran John Bidwell, a former congressman, as its candidate. Although the Prohibition Party never acquired numerical strength on the national level, its candidates did win election to several state and local offices.

Furthermore, one of the party's major effects on American politics was that it necessitated more careful scrutiny of a candidate's character.

The WCTU was formed in 1873 to focus attention on the problems associated with drunkenness. Under the leadership of FRANCES WILLARD, it became involved in social work, prison reform, public health, child nurseries, and the woman suffrage campaign. However, the Anti-Saloon League (ASL) had a much narrower focus. The ASL was founded in 1893 and organized local campaigns across the nation against the sale and consumption of alcoholic beverages. In effect, the ASL was a single-issue pressure group whose members called for the legal abolition of saloons. The ASL used a network of local and state chapters and its presses in Westerville, Ohio, to publicize the role of alcohol consumption and the saloon in health problems, family disorder, poverty, political corruption, and workplace inefficiency. Gradually, its assault on the neighborhood saloon grew to include a call for a nationwide prohibition of the sale and manufacture of alcoholic beverages.

The Prohibition Party, the Anti-Saloon League, and the Women's Christian Temperance Union convinced the nation to try prohibition. In 1919 the Eighteenth Amendment was ratified, banning the manufacture, sale, and transportation of intoxicating beverages in the United States. Although it did indeed cut alcohol consumption in the 1920s, it also led to excessive lawlessness, and the Prohibition Amendment was repealed in 1933 by the Twenty-first Amendment.

**protectionism** See TARIFF ISSUE.

**public health** See MEDICINE AND PUBLIC HEALTH.

**Pulitzer, Joseph** (1847–1911) *journalist, publisher* Although his highly successful *New York World* printed its share of scandal and gossip, Joseph Pulitzer is better known for the annual prizes bearing his name that are awarded

for excellence in journalism, history, biography, literature, and music. Born in Hungary on April 10, 1847, Pulitzer arrived in the United States at age 17. He served briefly in the Union army, moved to St. Louis, Missouri, and in 1868 became a reporter for CARL SCHURZ's German-language *Westliche Post*. The next year Pulitzer, a Republican, ran for the state legislature in a heavily Democratic district and, having campaigned seriously, won. In the legislature he fought graft and corruption and in 1872 was appointed as one of three police commissioners in St. Louis. He joined Schurz in the LIBERAL REPUBLICAN PARTY movement and attended its 1872 national convention, which nominated fellow journalist Horace Greeley for president. After Greeley, who also had the Democratic nomination, lost, Pulitzer became a Democrat.

Industrious and ambitious, Pulitzer bought the bankrupt St. Louis *Dispatch* in 1878 and merged it with the St. Louis *Evening Post* to form the *Post-Dispatch*. In the *Post-Dispatch* he launched crusades against gamblers and tax dodgers and ran a number of successful drives to improve St. Louis streets through repairs and cleaning. In 1883, at age 36, he purchased the ailing *New York World* and made it a success by combining sensationalism with public service. Beginning in 1895 Pulitzer engaged in a circulation war with William Randolph Hearst, who that year acquired the *New York Journal*. The two newspapers—and their publishers—created YELLOW JOURNALISM as they went head-to-head in trying to best the other with stories featuring entertaining gossip, prurient scandal, and sensational crime. In the early part of his career, Pulitzer had vowed to “expose all fraud and sham, fight all public evils and abuses” and disdained large headlines. However, in his circulation battle with Hearst's *Journal*, he changed his outlook and went to ever-larger headlines and type to attract readers to his stories. He defended this course by saying that people needed to know about crime in order to combat it, and he claimed that there was no contradiction in his paper's lurid news pages and its thoughtful, literate editorial pages. After a few years he ceased trying to out-Hearst Hearst, and the *World* in the early years of the 20th century became a responsible public-service newspaper with high journalistic and moral standards.

Believing that journalism should be more than a trade and that journalism education could elevate the job to a profession, he offered Harvard University a large sum of money to open a journalism school in his name. Harvard turned down Pulitzer's offer, and he instead provided \$2 million to Columbia University to establish the graduate school of journalism and the annual Pulitzer Prizes. He died aboard his yacht *Liberty* in the harbor of Charleston, South Carolina, on October 29, 1911.

### **Pullman Strike** (1894)

The Pullman Strike of 1894 began as a rebellion against greedy paternalism. George M. Pullman, the railroad sleeping-car mogul, built a “model town” (named after himself) complete with a park, playgrounds, and a library for his employees. But Pullman was not acting as a philanthropist; he made a profit on his investment by deducting rents and fees from the workers' wages. During the depression of 1893 Pullman cut wages by as much as 25 percent without lowering rents in the company town. When he fired members of the workers' committee that asked him to either restore the wage cut or lower rents, his employees walked off their jobs.

The strikers knew that they would fail if they could not stop Pullman's primary source of revenue, which was from RAILROADS using his cars. As members of the American Railway Union (ARU), an industrial union recently formed by Eugene V. Debs, they appeared at the organization's first convention begging for help. Flushed by a victory over the Great Northern Railroad, the convention delegates ignored Debs's advice and instructed him to order a boycott if Pullman refused to negotiate. Pullman refused, and Debs in June 1894 instructed his membership to stop moving the sleeping cars.

The General Managers Association, an organization of the 24 railroads serving Chicago, used the boycott as an opportunity to destroy the militant ARU. The railroads precipitated a general strike by firing workers who refused to move Pullman cars. The managers then appealed to Washington for help. Attorney General Richard Olney, a former railroad attorney, responded by appointing another railroad lawyer, Edwin Walker, as special assistant to the federal attorney in Chicago, instructing him to use all legal means to break the strike. One legal recourse was obvious; it was against the law to obstruct the movement of the mail, which most passenger but few freight trains carried. To secure the movement of the freight trains, Walker appealed to the courts to enforce the SHERMAN ANTITRUST ACT prohibiting conspiracies in restraint of trade. On July 2, 1894, the courts complied by issuing an injunction forbidding interference with any railroad activity and ordering Debs and anyone else to stop inducing workers to strike. The following day a U.S. marshall requested troops to help enforce the injunction. And on July 4 President GROVER CLEVELAND ordered the army into Chicago and other railroad centers, much to the dismay of Illinois governor JOHN PETER ALTGELD, who believed the troops were not needed.

Debs appealed to other unions for financial and moral support, but the request was largely ignored. The railroad brotherhoods were happy to see the upstart ARU disappear, and the AMERICAN FEDERATION OF LABOR (AFL) opposed industrial unions. Realizing the strike was doomed, Debs offered to call it off if the railroads promised to rehire the strikers. Management did not respond, and the strike disintegrated. The victorious railroads black-listed strike leaders, and the ARU collapsed. Arrested for

contempt of court, Debs was sentenced to six months in prison, and in the landmark case *In re Debs* (1895), the SUPREME COURT upheld the use of the injunction against striking labor unions.

**Quay, Matthew Stanley** (1833–1904) *politician, lawyer*

The quintessential political boss of the Gilded Age, Matthew S. Quay was born on September 30, 1833, in Dillsburg, Pennsylvania. He grew up in western Pennsylvania and graduated at 17 from Jefferson College, in Canonsburg, where he excelled in classics and literature. After reading law in a Pittsburgh law firm, he was admitted to the Beaver County bar in 1854. That same year he married Agnes Barclay; they had five children.

Quay's political career began just as the Republican Party developed in Pennsylvania. In 1855 Secretary of the Commonwealth Andrew Gregg Curtin, who respected Quay's father, a Presbyterian minister, recommended that Quay fill out the term of the Beaver County prothonotary (chief clerk of the court). Quay was elected and reelected to full terms in 1856 and 1859 and managed Curtin's 1860 gubernatorial campaign in Beaver County.

When the success of Curtin, Abraham Lincoln, and the Republican Party led to the secession of the South and civil war, Quay volunteered for military service. Curtin, however, made him his private secretary to handle his vast correspondence and also found him helpful in "meeting sudden and severe emergencies." Craving glory, Quay got Curtin in 1862 to make him colonel of the 134th Pennsylvania Volunteers, but by the year's end an attack of typhoid fever forced him to resign. Although relieved just prior to the December 13 Battle of Fredericksburg, Quay, though still weak, earned the Congressional Medal of Honor, while leading his men in the final, futile bloody charge on Marye's Heights. Upon recovering his health, Quay resumed his task of answering Curtin's mail from Pennsylvania's troops. Grateful for the interest Quay had shown in them, veterans supported him throughout his career.

Quay was a masterful political strategist, who transferred his intraparty loyalty from Curtin to his rival, Simon Cameron. For supporting Cameron, Quay was named secretary of the commonwealth in 1873 and became

Cameron's political manager. When Cameron, in 1877, resigned from the U.S. Senate in favor of his son Don (who proved inept at party leadership), Quay emerged by 1879 as the boss of Pennsylvania and in 1887 was elected to the U.S. Senate, where he remained until his death.

Quay used his talents to win elections rather than to originate or legislate policy. He excelled in absenteeism and shunned important committee assignments, preferring to distribute favors (usually new post offices) as chair of the Committee on Public Buildings and Grounds. His interest in the tariff ended when his constituents were protected. Issues did not interest him because he believed good organization would defeat good ideas. Since his effective organization depended on control of the thousands of election units in Pennsylvania, Quay kept card files on local politicians, listing favors they received, their strengths, weaknesses, and secrets. When faced with party revolts in Philadelphia and Pittsburgh, he used the information on his cards to line up support. Money to run his machine—to provide favors—came from political assessments of both officeholders and industrialists, who contributed as long as he protected their interests.

Quay was an audacious and sagacious captain in a political campaign. As chair of the Republican National Committee in 1888, he engineered BENJAMIN HARRISON's victory, even though he had 100,000 fewer votes than his Democratic opponent GROVER CLEVELAND, and secured a Republican Congress. Quay accomplished this feat by frying \$400,000 of "fat" out of Pennsylvania manufacturers, using \$150,000 of it to eliminate fraudulent voters in New York City by compiling a list of legitimate voters there, and dispatching well-heeled henchmen to buy voters in close congressional districts. Harrison carried New York and with it the election, and told an incredulous Quay, "Providence has given us the victory," to which Quay later exclaimed, "Providence hadn't a damned thing to do with it," adding that Harrison would never know "how close" men approached "the gates of the penitentiary to make him President."

Quay was corrupt as well as astute. To supplement political assessments and business contributions, he repeatedly used state funds. From the early 1870s until his death Quay was almost invariably state treasurer or close to the person who was treasurer. The state treasurer could deposit state money in banks without receiving interest for the state. Anxious to secure these funds, banks showered favors on state treasurers, who usually left their office wealthier than when they entered it. In 1880, with the compliance of the state treasurer, Quay, through speculation, lost \$250,000 of the state's money. When the scandal broke in 1885, he was saved from ruin by a \$100,000 loan from Don Cameron. Seeking vindication, Quay audaciously ran for state treasurer in 1885, used his cards to call in political debts, and won the election. In office he proceeded to speculate with \$400,000 in state funds, made a profit, paid off Don Cameron, and returned the \$400,000 he had essentially

embezzled. A passionate stock-market speculator, Quay in 1898 was again caught using state funds. "I don't mind losing a governorship or a legislature now and then," Quay quipped, "but I always need the state treasuryship."

Quay was a man of contradictions. Although an urbane guest and gracious host, he would rather read at home or fish for marlin in Florida than attend a fashionable Washington ball. He was corrupt and cynical, yet no one was more patriotic, brave, and loyal to his troops than he was at Fredericksburg. No one excelled him in machine politics, and no politician excelled him in his love of literature and books. Before he died on May 28, 1904, one of his last requests was "to see my books once more."

## **railroads**

The Gilded Age was the golden age of railroads. Railroad mileage almost quadrupled from 54,000 in 1870 to 193,000 in 1900. Four major trunk lines (New York Central, Erie, Pennsylvania, and Baltimore & Ohio) connected the eastern seaboard with the Midwest, and railroads penetrated the trans-Mississippi West. The East and West Coasts were first linked across the continent in 1869 when the Union Pacific met the Central Pacific along the central route; the connection was further solidified by the later completion of transcontinentals to the north (the Northern Pacific in 1883 and the Great Northern in 1893) and to the south (the Southern Pacific [1883] and the Santa Fe [1884]). Shorter feeder lines were acquired or constructed by trunk lines, creating large systems that crisscrossed the nation with a grid of rails, giving the United States the most extensive rail system in the world.

While railroad mileage almost doubled in the 1870s and the 1880s, only 30,000 miles of track were added in the 1890s. By then the roads concentrated less on expansion and more on improving existing lines and making them more efficient. Railroads were rebuilt, eliminating curves, reducing grades, replacing iron bridges with stronger steel structures, widening tunnels, retracking with heavier steel rails and better ties, double tracking in areas of great density, introducing more sophisticated signaling systems, enlarging freight yards, and building beautiful passenger stations. More powerful locomotives, attractive passenger

cars, and capacious freight cars equipped with automatic couplers and air brakes were also introduced. With these improvements railroads by 1900 were able to reduce the cost of moving a ton of freight one mile (a ton mile) to three-quarters of one cent.

The impact of railroads, with their enormous and efficient carrying capacity, on the American economy and society can hardly be exaggerated. Railroads made possible the rapid settlement of the West and the spectacular growth of cities in the late 19th century. Railroads transported bulky products of mines, forests, and fields cheaply to smelters and mills for processing and refining, then to manufacturers, and finally to consumers in rural and urban areas. Railroads facilitated the phenomenal growth of large-scale factories by supplying them with materials, distributing finished goods far and wide, and by giving food to their workers and families. The railroad network converted mid-19th-century regional economies into a national economy. For example, cheaper factory goods from the East caused less efficient California manufacturers to cut labor costs by using underpaid Chinese laborers, touching off racist riots. At the same time, superior California pears ruined Pennsylvania pear growers. Easy and rapid transportation also bound the nation closer, bringing outlying areas nearer to the mainstream. Trips that earlier in the 19th century were arduous, hazardous, and literally took months could be completed in a few days in comfortable sleeping cars during the Gilded Age.

By 1870 railroads had developed into the largest business enterprises the nation had seen. Major railroads built or acquired thousands of miles of track stretched over several states. They required enormous investments of capital in their rights of way, rolling stock, freight-handling facilities, and passenger stations. And they were built and operated by a labor force the size of an army and whose strikes were among the most spectacular of the era (the GREAT STRIKE OF 1877, the KNIGHTS OF LABOR in 1885–86, and the 1894 PULLMAN STRIKE). Although railroads were pri-

A Currier and Ives engraving showing two express trains leaving the station, 1874 (*Library of Congress*)

vate corporations, their construction (especially of western roads in sparsely populated areas) was financed in part by the federal land grants and by outright gifts from communities anxious for rail service. American and foreign, especially British, investors bought railroad bonds and financed most of their construction.

In 1870 some railroads were controlled by dishonest, corrupt managers who cheated their investors and bribed legislators. The construction companies they created (like the Credit Mobilier) to build the road (like the Union Pacific) would pad costs and pay the insiders enormous dividends, leaving the road—which they would abandon—deeply in debt and overcapitalized. This was accomplished by “watering” the stock, i.e., by selling more securities than the real worth of the railroad. In the late 1860s, because federal loans financed construction of the Union Pacific, the Credit Mobilier used some of that money to bribe members of CONGRESS. JAY GOULD of the Erie Railroad spent \$1 million bribing the New York State legislature to legitimize the fraudulent issuing of stock. Overcapitalization took its toll. After Gould abandoned the Erie Railroad, it went bankrupt four times. Following the panic of 1893, railroads controlling one-third of the nation’s mileage were bankrupt.

By 1900, however, investment bankers like JOHN PIERPONT MORGAN had reorganized bankrupt roads and

squeezed most of the “water” out of railroad indebtedness. Morgan (among others) also worked to consolidate railroads into ever-larger systems. His efforts culminated in the 1901 Northern Securities Company, which controlled the Northern Pacific, Great Northern, and the Chicago Burlington & Quincy, thus monopolizing territory from Chicago to Seattle. This led to the 1904 *Northern Securities* case, wherein the SUPREME COURT dissolved that holding company as a violation of the SHERMAN ANTI-TRUST ACT (1890).

From their beginning, railroads had been subject to government regulation. Chartered by states as common carriers, railroads were forbidden to discriminate among their customers. But railroads were competitive at some points (usually cities served by other railroads or water transportation) and monopolistic over long stretches of their tracks (usually rural areas), and these facts encouraged them to discriminate. To boost the volume of freight carried between competitive points, railroads would offer large shippers like Standard Oil “rebates” (a refund of part of the published rate), charging them less for a long haul than they charged for a short haul along routes where they had a monopoly. Railroads preferred not to give rebates and occasionally attempted to create pools among themselves, dividing up tonnage or revenues and thus avoiding ruinous rate wars between competitive points.

Farmers, merchants, communities, and even regions were outraged by discrimination and by monopolistic pools, and in the 1870s they turned to politics and formed the Granger movement (*PATRONS OF HUSBANDRY*) to seek redress in government regulation. Responding to their demands, state legislatures in the Midwest passed legislation setting rates and eliminating the long-haul/short-haul abuse, and in 1876 the Supreme Court in *MUNN V. ILLINOIS* upheld state regulation of railroads even if involved in interstate commerce. Ten years later, the Court reversed itself in *WABASH V. ILLINOIS* (1886), holding that states could not regulate interstate commerce and triggering demands in the West and South for federal action. Congress responded in 1887 with the Interstate Commerce Act, which was too strong for the railroads and too weak for reformers. Railroads were disturbed when pools were outlawed, but there was a loophole in the clause that prevented long-haul/short-haul discrimination, so while railroads had to adhere to published rates, the law did not specifically provide for rate regulation. It did provide for the Interstate Commerce Commission (ICC) to administer the act. The ICC was effective until 1897, when the Supreme Court specifically outlawed its power to set rates (*Maximum Freight Rate* decision) and so interpreted the long-short haul clause to render it useless (*Alabama Midland* case). The ICC was reduced to collecting statistics, and effective railroad regulation was postponed until the Progressive Era.

**Red Cloud (Mahpiya Luta)** (ca. 1822–1909) *leader in the war for the Bozeman Trail*

An Oglala Sioux war leader, Red Cloud was one of their fiercest warriors, rivaling fellow Oglala CRAZY HORSE. However, once Red Cloud recognized the futility of further warfare, he became one of the “statesmen” of the Sioux people, traveling to Washington, D.C., to broker peace deals and establish reservations in the Dakotas.

Red Cloud was born along the North Platte River in modern-day western Nebraska. After his father died, he

was raised by his maternal uncle, Chief Smoke. Red Cloud earned a reputation as a skilled warrior while fighting rival tribes such as the Pawnee, Crow, Ute, and Shoshone. He sided with his uncle in an Oglala dispute, which prevented him from becoming chief of the tribe at that time, but by the 1860s he was considered one of the war leaders of the Oglala.

In the spring of 1865 Red Cloud's forces began attacking whites who encroached on Oglala land on their way to gold mines in Montana. After failed negotiations with the U.S. government, Red Cloud's warriors and other Lakota, in the War for the Bozeman Trail (1866–68), forced the army to abandon its Bozeman posts. That war is notable as the one western engagement decisively won by Indian forces. Red Cloud negotiated a treaty at Fort Laramie in 1868 establishing the Great Sioux Reservation in South Dakota, but several bands refused to accept the treaty and move to that reservation and criticized him for pursuing diplomacy. Although he was a great warrior, Red Cloud in subsequent SIOUX WARS consistently advocated peace. He traveled to New York and Washington, D. C., in 1870 and settled on the reservation in 1871. The move of white settlers onto Sioux lands following the discovery of gold in the Black Hills led to the War for the Black Hills (1876–77). Red Cloud opposed that war and encouraged Crazy Horse to surrender in 1877, but the army suspected Red Cloud of having secretly supported his fellow Sioux in the campaign culminating in General GEORGE A. CUSTER's disaster at the Battle of Little Bighorn, where indeed his son had fought. General George Crook denounced Red Cloud and tried unsuccessfully to depose him as chief.

Following Crazy Horse's surrender, the Oglala Sioux were confined on the Pine Ridge Agency in western South Dakota, and Red Cloud was regarded as their chief by the Oglala and the federal government. Red Cloud soon ran into difficulty with Valentine T. McGillicuddy, the government agent in charge of the reservation, who regarded him as a nonprogressive opponent of acculturation. Red Cloud petitioned for McGillicuddy's removal and fought to preserve the Great Sioux Reservation. Red Cloud opposed the DAWES SEVERALTY ACT of 1887, which redistributed reservation land to members of Native American tribes, replacing communal ownership with individual ownership and reducing the size of reservations. Red Cloud continued to oppose individual ownership and only in 1905, feeble and nearly blind, did he accept his allotment. Nevertheless, he remained a man of peace. During tensions stemming from the Ghost Dance movement in 1890, Red Cloud again tried unsuccessfully to prevent bloodshed. Although opposed to acculturation, he made it a two-way street by mingling Lakota and Christian religious ideas, and prior to his death on December 10, 1909, he was baptized as a Roman Catholic.

**Reed, Thomas Brackett** (1839–1902) *politician*

Thomas Brackett Reed, the powerful Speaker of the House of Representatives, was born on October 18, 1839, in Portland, Maine, the son of Thomas Brackett Reed, Sr., and Mathilda Prince Mitchell. Following his graduation from Bowdoin College (1860), Reed taught school and began to study law in California. In 1863 he returned to Portland and was appointed in 1864 as an acting assistant paymaster in the navy, serving to the end of the Civil War. After his discharge from the navy, Reed resumed his legal studies in Portland and in 1865 was admitted to the Maine bar. In 1870 Reed married Susan Merrill Jones, with whom he had two children.

Reed was a member of the REPUBLICAN PARTY. From 1868 to 1869 he served in the lower house of the Maine state legislature and in 1870 in the state senate. Elected as the attorney general of Maine in 1870, he served from 1871 to 1874 but failed to be renominated, and from 1874 to 1877 he served as city attorney for Portland. Elected to the U.S. House of Representatives in 1876, Reed assumed the seat vacated by JAMES GILLESPIE BLAINE when he was elected to the Senate.

In the House, Reed quickly distinguished himself. In 1878, as a minority member of the Clarkson Potter Committee investigating the disputed presidential election of 1876, Reed uncovered evidence of fraud and violence in Louisiana and discredited several Democratic witnesses. As a congressman, he favored federal policies that would secure voting rights for AFRICAN AMERICANS in the South, advocated protective tariffs, supported the gold standard, and opposed greenbacks, BIMETALLISM, and the FREE SILVER MOVEMENT. He voted against the BLAND-ALLISON ACT of 1878 and in 1893 supported President GROVER CLEVELAND's demand for the repeal of the Sherman Silver Purchase Act of 1890.

In 1889, when the Republicans regained control of the House, Reed was chosen Speaker and moved to expedite business. Opposition members had paralyzed the House by refusing to answer the roll call and preventing the quorum necessary to legislate. As Speaker, Reed achieved a quorum by counting as present members who refused to answer the roll call. He then forced the adoption of the so-called Reed rules, strengthening the Speaker's control over floor procedures, and by so doing was called "Czar Reed." Using his power as Speaker, Reed enabled the 51st Congress ("billion dollar Congress") to enact such legislation as the MCKINLEY TARIFF and the SHERMAN ANTITRUST ACT

(1890). However, when the Democrats returned to power after the 1890 elections, they restored the old rules in the 52nd and 53rd Congresses.

The Democrats lost control of Congress in 1894, and the Republican majority reelected Reed to the speakership and reinstated his rules. In 1896 Reed was mentioned as a possible Republican presidential candidate. A powerful but acerbic figure in Congress, he could not attract national support. The Republicans instead nominated the far more affable WILLIAM MCKINLEY for the presidency. After the Republican victories in the 1896 elections, Reed was again elected to the speakership. Reed pushed the Dingley Tariff (1897) through the House but unsuccessfully opposed going to war with Spain in 1898 and the acquisition of colonial possessions. Disgusted with IMPERIALISM, Reed resigned from Congress in 1899 and entered private law practice in New York City, where he resided until his death on December 7, 1902.

**Reid, Whitelaw** (1837–1912) *journalist*

Whitelaw Reid was born near Xenia, Ohio, on October 27, 1837. A bright and ambitious youth, he excelled in Latin, foreign languages, and science and graduated in 1856 with honors from Miami University in Oxford, Ohio. He had published items in the local paper and was a partisan of the new Republican Party. A year as a schoolmaster rid him of any desire to teach, and in 1858 he found his life's work when he acquired part ownership of the *Xenia News* and edited it for two years. In March 1861 he began covering the Ohio legislature at Columbus for three papers, including the *Cincinnati Gazette*. Later that spring he became the latter's city editor.

The Civil War, beginning in 1861, enabled Reid to demonstrate his ability as a newsman. He earned praise for his intelligent coverage of campaigns in western Virginia and the Battle of Shiloh in Tennessee. After 1862 he became an eastern correspondent for the Western Associated Press and provided a classic account of the Battle of Gettysburg.

In Washington, D.C., Reid was close to such Radical Republicans as Salmon P. Chase and Henry Winter Davis. With peace Reid went south for two years and was unsuccessful as a cotton planter in Louisiana and Alabama, before returning to the *Cincinnati Gazette* in 1867.

HORACE GREELEY gave Reid his great opportunity, calling him in 1868 to the *New York Tribune*. Within a year

Reid was the *Tribune's* managing editor. He secured literary contributors such as MARK TWAIN and BRET HARTE and added JOHN MILTON HAY, who had been Abraham Lincoln's secretary, to the editorial staff. When Greeley was nominated for president by the LIBERAL REPUBLICAN PARTY in 1872, Reid became the acting editor of the *Tribune*. When Greeley died, shortly after being decisively defeated by ULYSSES S. GRANT, Reid held on to the editorship, after borrowing money from JAY GOULD and buying stock in the *Tribune*.

At 35 Reid was editor of one of America's most prestigious papers, but it was running a deficit and faced financial disaster. Reid's editorial policies won back the *Tribune's* regular Republican base (lost during the election when the paper supported Greeley and Liberal Republicans) and turned around the paper. Reid emphasized his devotion to true Republican Party principles, while criticizing Grant and his stalwart cronies, as his second administration became mired in corrupt scandals. Unlike Liberal Republicans, Reid had little sympathy for CIVIL SERVICE REFORM and none for tariff reform. His ideal statesman was JAMES GILLESPIE BLAINE, whom reformers considered unfit for the presidency but whom the Republican rank and file idolized. Thanks to Reid's policies and intelligent, responsible reporting, the *Tribune's* circulation recovered and leveled off at about 60,000 daily in 1876. With renewed prosperity the *Tribune* moved into an impressive new building in 1875—only the spire of Trinity Church was higher—and Reid quickly adopted technological advances, such as the Mergenthaler linotype machine.

Under Reid the *Tribune* regularly supported Republican presidential candidates, beginning in 1876 with RUTHERFORD B. HAYES. Hayes defeated SAMUEL JONES TILDEN, Democrats charged, because of Republican fraud in counting votes in the South. *Tribune* staff members, however, in 1878 decoded the mysterious "cipher dispatches," sent from Tilden's home, which attempted to buy the 1876 election. The *Tribune's* scoop silenced Democratic charges of Republican fraud, delighting Hayes, who invited Reid to a state dinner at the White House. There, First Lady Lucy Hayes sat him next to Elizabeth Mills, the daughter of a millionaire California banker. They married on April 26, 1881, and had two children.

The political scene altered dramatically for Reid with the July 1881 assassination of his good friend, President JAMES ABRAM GARFIELD, and with his death in September, the assumption of the presidency by CHESTER ALAN ARTHUR, the stalwart lieutenant of Reid's political enemy ROSCOE CONKLING. Believing Arthur was strengthening stalwart Republicans in New York, Reid refused to support the party's gubernatorial ticket in 1882. That move backfired when the Democrat GROVER CLEVELAND triumphed so impressively that he won his party's presi-

dential nomination in 1884, and narrowly defeated Reid's hero Blaine.

Reid had been highly critical of Cleveland in the campaign and continued to criticize him during his presidency. But, meanwhile, marriage, wealth, and capable lieutenants enabled Reid to step back from the paper and lead a more active social life. He supported BENJAMIN HARRISON for president in 1888, and when he won, Harrison appointed him minister to France. After three enjoyable years he returned to the United States to work for Harrison's reelection in 1892 and was rewarded with the vice presidential nomination. Naming Reid, however, did not inspire the New York Republican machine, controlled by Conkling's successor, Thomas C. Platt, whom Reid had consistently opposed, and Cleveland carried New York and won the election.

Four years later, with WILLIAM MCKINLEY's election to the presidency in 1896, Reid was rewarded for his unswerving support. He embraced MANIFEST DESTINY and supported the SPANISH-AMERICAN WAR (although he had not clamored for it in the *Tribune*). As a commissioner to negotiate peace with Spain, he advocated annexing the entire Philippine archipelago and defended the treaty against the attacks of the ANTI-IMPERIALIST LEAGUE. Reid supported President Theodore Roosevelt's high-handed policy in Panama, and in 1905 he gave up the editorship of the *Tribune* and went as Roosevelt's ambassador to Great Britain. He remained in that post until his death on December 15, 1912.

## religion

Religious diversity has always characterized the United States because it is both a land of freedom and a nation of immigrants. With everyone enjoying liberty of conscience, the various religions brought by migrants have often fractured, leading to the emergence of new religions and sects. And within each religion, challenges posed by the changing social order demanded new and frequently unsettling responses. The quickening pace of life in America during the last third of the 19th century posed great challenges and added significantly to the diverse religious scene. Four general trends affected American religion between the Civil War and 1900. These developments involved adjusting to the results of the Civil War, confronting the urban-industrial challenge, dealing with the intellectual-scientific challenge, and the growth of non-Protestant religions. The roots of these trends existed beforehand, and their effects remained long after, but all matured during the Gilded Age.

Prior to the Civil War the antislavery issue divided the Baptists, Methodists, and Presbyterians into northern and southern denominations. The war further accentuated their differences, and although the hierarchal churches (Roman Catholic, Lutheran, and Episcopal) retained their traditional structure, regionalism also stamped their nature. These differences gave rise to the cultural identity attached to southern Protestantism. The churches that defended the Confederacy during the war became bastions for old-time life and old-time religion. Southern Protestant churches, never doubting the literal authenticity of the scriptures, were among the most vigorous in resisting the theological challenges of Darwinism and the new scholarship. Finally, postbellum America, especially in the South, segregated the faiths by establishing AFRICAN-AMERICAN CHURCHES and denominations. In part, separation was the work of white churches that banished blacks, but disenfranchised black communities also wanted to form their own institutions. The black church in the South became the center of power for the black community, and by the end of the century the church comprised the single largest category of property and assets in that community.

Perhaps the most serious challenge to late 19th-century religion was the rapid industrialization and urbanization of the nation. Not only had native-born Americans abandoned the churches in their small, close-knit, rural communities for the anonymity of large impersonal cities, but those cities were also flooded by immigrants from abroad. Protestantism's first response was to save souls lost in the urban wilderness with Sunday schools for adults as well as for children and with revival meetings. DWIGHT LYMAN MOODY was the most successful evangelist of the Gilded Age, converting literally thousands in revival meetings in the major cities. Moody and those who followed him were generic Protestants, noncreedal evangelicals, emphasizing God's love and that salvation was more an inner personal matter not dependent on church doctrine or community approval. While the evangelists were immensely popular in their time, the power of revivalism peaked soon after Moody died in 1899. He also had promoted adult Sunday schools, having organized a thriving one among the poor in Chicago at the beginning of his career. B. F. Jacobs, encouraged by Moody, and John H. Vincent of the Sunday School Union gave the American Sunday School movement structure, uniformity, and vitality. The movement in turn helped meet the needs of a new urban generation for structure, community, and connection in an unpredictable world. The CHAUTAUQUA movement with its adult educational program was a direct outgrowth of the Sunday School movement.

Large cities and the publicity available there made the rise of the preacher/celebrity possible. While Moody the revivalist had the greatest national exposure, there were

preachers who were not revivalists and yet achieved high visibility in their pulpits and preached to huge congregations. Most famous and infamous of these was HENRY WARD BEECHER of the Brooklyn, New York, Plymouth Congregational Church, who embraced reforms as well as his female parishioners (see BEECHER-TILTON SCANDAL). In Boston, PHILLIPS BROOKS achieved an almost equal stature as rector of Trinity Episcopal Church. Like Beecher and other urban pastors, Brooks was a broad-church man, speaking not to or for Episcopalians but to a wide cross section of Americans as one family. With one foot in an older world, with its romantic optimism and traditional moralism, and another in the modern world of industry and science, Brooks and Beecher both straddled the intellectual and spiritual divide, trying to harmonize the dissonant features that others considered hopelessly discordant.

In contrast to the stress of revivalists on achieving eternal life in the next world, the advocates of the SOCIAL GOSPEL stressed achieving a decent standard of living in this world. They believed that religion from a practical, intellectual, and spiritual point of view had to address the problems spawned by industrialism and urbanism. Inspired by the thought of WASHINGTON GLADDEN and organized by the work of JOSIAH STRONG, the Social Gospel saw the church's mission in the city as more than just saving souls; the church also had a duty to comfort the afflicted and afflict the comfortable and to encourage government to play a larger role in regulating industry, protecting labor, and eradicating poverty.

While the growth of factories and the rise of cities caused people to drift away from their churches, the intellectual challenge of 19th-century science appeared to erode the very basis of Judeo-Christian religions. Scientific methods, discoveries, and theories in geology, biology, and history questioned the literal text of the Bible. Charles Lyell's three-volume *Principles of Geology* (1830–33) raised disturbing questions about the age and development of the Earth, but when Charles Darwin's *On the Origin of Species* (1859) theorized (on the basis of evidence) that plants and animals had evolved over eons through natural selection—and were not created by God in a few days—the effect was revolutionary. At the same time biblical scholars (higher critics) in Germany, analyzing language and applying rules of evidence, questioned the authorship and dates of various books of the Bible.

Christians divided into liberal and orthodox groups. The liberals accommodated their theology to the new scholarship, while the orthodox adhered to their faith that the Bible was literally the word of God. For liberals, JOHN FISKE's *Outlines of Cosmic Philosophy* (1874) reconciled theism and EVOLUTION by arguing that there was no conflict between science and religion. He relegated religion to what the leading apostle of evolution, Herbert Spencer,

called “the unknowable.” Indeed, liberals came to view evolution as God’s plan. Henry Ward Beecher associated evolution and progress with Christianity and civilization. By 1900 preachers were citing evolution as a proof of Christianity rather than a challenge to it. In a similar adjustment, Charles A. Briggs, a distinguished higher critic, while rejecting as idolatrous the idea that the Bible was literally without error argued that higher criticism was in the spirit of the Reformation and promoted a better understanding of God through a better understanding of his word.

The extent of liberal acceptance of the implications of Darwinism and higher criticism varied. Some saw religion as a natural phenomenon and Christianity merely as one expression of that impulse, subject to the same tests of integrity as any other faith or, for that matter, any secular idea, but most liberals still believed that Christianity was special and not just one among many valid religions. By 1900 the seminaries and urban ministers of the major Protestant denominations were comfortable with an evolutionary philosophy that apparently confirmed the superiority of Christianity because it seemed to be the “most” evolved of the world’s religions. Ironically, Darwinism, initially perceived as a threat by Protestants, was a generation later used by some, like Josiah Strong, to sustain a belief in American Protestant Anglo-Saxon superiority and, inspire missionary activity.

Orthodox Protestants, who tended to be rural and working class, also varied their responses as they rejected evolution, higher criticism, and the Social Gospel. The entire South was orthodox, while in the North, mainstream Protestant denominations had orthodox and liberal wings or factions. For example, the overwhelmingly conservative leadership of the Presbyterians in 1893 suspended Briggs from the ministry for the heresy of higher criticism, although New York Presbyterians disagreed and did not think him a heretic. The acceptance of Darwinism and of higher criticism in scholarly seminaries and in fashionable churches led to a resurgence of millennialism within mainstream churches and the establishment of new denominations. The emphasis on prophecies of the imminent second coming (advent) of Christ and the end of the world led to an emphasis on the literal, not the metaphorical, truth of the Bible.

Adventism originated with William Miller, who mistakenly predicted the coming of Christ in 1844. Although bitterly disappointed, Ellen Gould Harmon White began having prophetic visions that Christ would soon come, gathered supporters about her, and in 1863 with her husband James organized the Seventh-Day Adventist Church at Battle Creek, Michigan. Under her leadership Adventists emphasized fidelity to the Bible and, because of her infirmities, health and diet. Her protégé, John Harvey Kellogg, as head of the Battle Creek Sanitarium, realized her

principles and developed his ideas, and in so doing he gave the world corn flakes and peanut butter.

Another distinct Adventist group is the Jehovah’s Witnesses, founded in the 1870s by Charles Taze Russell (1852–1916). He differed from other Adventists in believing that Christ had begun to return spiritually in 1874 and that by 1914 God’s kingdom would take over the world. The onset of World War I in that year raised hopes that it would lead to the Battle of Armageddon and the beginning of God’s kingdom. Following Russell’s death the Witnesses, led and considerably altered by Joseph Franklin Rutherford (1869–1942), endured.

Adventism was also embraced by those in mainstream churches who reacted against modernity. Orthodox scholars organized two prophecy conferences (in 1878 and 1886) and also an annual Niagara Bible Conference to share in recognizing signs of the end and also to uphold a literal belief in the Bible. Through their Bible study they decided that God had ordained a system of “dispensations,” or eras, following upon each other and ending with the last days. A close associate of Dwight L. Moody, Cyrus Ingerson Scofield (1843–1921), was its chief advocate. Scofield, a Congregational minister, consolidated the dispensational scheme into seven ages, concluding with the Great Sabbath or the Millennium of Christ ushered in by the Second Coming and the End of Days. His work endures today in the popular *Scofield Reference Bible* (1909). Vital to the dispensational analysis of history and the Bible is the need to assert the literal and infallible authority of the Bible; from that need, the 20th-century Fundamentalist movement developed.

The most important religious trend of the late 19th century was the growth of faiths apart from the major Protestant denominations of Methodists, Baptists, Presbyterians, Congregationalists, and Episcopalians. The numbers of Roman Catholics and Jews—and, among Protestants, Lutherans—were augmented by the enormous volume of IMMIGRATION in the Gilded Age. Other non-Protestant groups such as the Eastern Orthodox, Islam, and Asian faiths were known in America, but they did not achieve visibility beyond their own communities until the 20th century. In addition, there were Mormons, Spiritualists, Theosophists, and the religions of indigenous NATIVE AMERICANS (Indians). Increasing diversity led to the religious pluralism of the 20th century.

The rise of ROMAN CATHOLICISM was rapid. There were 200,000 Catholics in 1829, 3 million in 1860, 7 million in 1880, and 10 million in 1900. Migrants, especially from Ireland, accounted for much of this growth, making the American Catholic Church quite Irish in character. Roman Catholicism grew also by virtue of the nation’s conquest of Mexican territory in the Southwest and by attracting dissatisfied Protestants. The most notable converts were

Isaac Hecker, who founded the Paulist order of priests, and Orestes Brownson, who in a distinguished publishing career defended both Americanism and Catholicism.

Hostility with strong racist overtones dogged the Roman Church. Anti-Catholic nativists, who formed political parties in the 1840s and 1850s, and the AMERICAN PROTECTIVE ASSOCIATION (APA) in the 1880s and 1890s combined religious bigotry with ethnic hostility to Irish and eastern and southern European immigrants. The nativists suspected that the Catholic Church was clandestinely working to undermine both the American state and Protestant values.

In fact, the opposite was true. The Americanism of late 19th-century American Catholicism caused problems with Rome and precipitated within the church the Americanism crisis. In essence, it was a culture war, since the Roman Catholic hierarchy was authoritarian and reactionary and America was democratic and progressive. In 1895 Pope Leo XIII's encyclical to the American Church, *Longinqua Oceani*, lamented the separation of church and state and admonished the faithful to be obedient to their bishops and to associate mostly with other Catholics. His additional pronouncement in 1899 warned American bishops and others of the risk of heresy in adopting American values too thoroughly. That the Church later called the whole group of issues "modernism" reveals the real issue: America was the wave of the future, while the Church looked to the past. Leo's fears, however, were misplaced, since the liberalism of American Catholics was social and political, not doctrinal or institutional, and they were not about to become heretics or revolutionaries. But Leo effectively silenced liberal thought, making the American Catholic Church between 1900 and the Vatican II Council (1962–65) a very cautious body.

The rise of JUDAISM was also rapid in the late 19th century, but in contrast to Catholicism it experienced an institutional transformation. Orthodox Judaism prevailed early in the 19th century, but on the eve of the Civil War the ferment of radical religious reform that resulted from the Jewish enlightenment in Germany spread to the American Jewish community. In 1846 Isaac Mayer Wise and in 1855 David Einhorn, both influential reform-minded rabbis, arrived in the United States from Germany. Arriving in Baltimore, David Einhorn dispensed with Hebrew and the ceremonial (including dietary) laws, and Wise in 1853 began his rabbinate in Cincinnati, where he founded two magazines and wrote many books to promote reform. In 1873 Wise helped found the Union of American Hebrew Congregations, the Reform Jewish association of synagogues. By 1880 it claimed the overwhelming majority of synagogues in the United States. In 1885 Reform Judaism proclaimed an 18-point platform that Einhorn heavily influenced and Wise called "the Jewish Declaration of

Independence," spelling out principles of Reform Judaism that endured until the late 20th century.

At that same moment, though, Judaism began shifting again in response to the wave of immigration from the Ashkenazic Jews of eastern Europe, which doubled the number of synagogues in the United States between 1880 and 1890. With the Yiddish language and a subculture created by oppression, these Jews were unresponsive to reform ideas and responsible for the resurgence of Orthodox Judaism. By 1900 Judaism was on the verge of becoming the familiar trinity of Orthodox, Reform, and Conservative. In two or three generations, the most ancient western faith had become, in part, one of the most modern.

Although Protestant, Lutherans were like Jews and Catholics in that they comprised strong ethnic communities for whom faith was part of their identity. Loyal to their German and Scandinavian cultures, Lutherans were not truly a part of the broader Protestant milieu. Three million Lutherans immigrated to the United States between 1869 and 1918. Most came to escape rural poverty and had no quarrel with Lutheran liturgy and doctrines, and many, especially among the Scandinavians, went to the Midwest and plains states. Lutherans formed local synods (at one point there were 66 independent church organizations), but there remained a general unity of faith and practice. A series of mergers and connections in the late 19th century brought most, except a few orthodox groups, into some sort of union in all but name.

**THE MORMON CHURCH**—Church of Jesus Christ of Latter-day Saints, founded by Joseph Smith (1805–44) in 1830—was an American original. Smith claimed the *Book of Mormon*, which he published in 1830, was a sacred record of contemporaries of Jesus in North America, among whom he lived and taught following his resurrection. Smith and his adherents were persecuted and hounded from place to place as much for their formidable presence as for their beliefs, which included polygamy. He was lynched in 1844, but the Mormons, led by Brigham Young (1801–77), fled west to the valley of the Great Salt Lake. The Zion they built was politically a theocracy, with Young at its head, and economically a mixed system with family-owned and family-worked plots of land, cooperatively owned herds, and church-owned milling, mining, transporting, banking, and merchandising enterprises.

Mormon theocracy and polygamy caused problems with the federal government. Congress in 1850 created the Utah Territory, and Young initially served as governor, but other federal appointees were hostile to the politically powerful and economically dominant Mormon Church, and Young was removed in 1857. Troops were dispatched to uphold federal authority, to which Young submitted in 1858 after the Mormons were promised amnesty. Although Young was no longer governor, he remained, as head of the

church, the dominant political force in Utah. The federal government, however, gradually increased pressure on the Mormons. CONGRESS in 1862 passed a law that banned polygamy, which in 1879 was upheld by the SUPREME COURT. Two subsequent federal laws brought political and economic sanctions into play, in 1890 the church renounced plural marriage, and in 1896 Utah became a state. The communitarian aspect of Mormonism gave way to the vigorous individualism of America at large. Perhaps the largest dissenting Euro-American social order in the 19th century, Mormonism in the 20th century ironically became a bastion of conservative American cultural values.

Spiritualism arose in the “burned over district” of western New York State in 1848 by way of Margaret Fox (ca. 1833–93) and her sister Catherine (ca. 1836–92). They interpreted strange rappings first in their home and then elsewhere as contact with the spirits of the dead. They gave public demonstrations, and Horace Greeley, who had recently lost his five-year-old son, believed in them and publicized them. As other “mediums” appeared and gave “seances,” spiritualism grew rapidly. Many who were religious, especially Quakers and Swedenborgians, embraced spiritualism because it confirmed the existence of the immortal soul. It also gave comfort to the bereaved, like the Greeleys and Abraham Lincoln’s wife Mary. In 1870 spiritualism reached its greatest acceptance and size, claiming 11 million “believers.” Although the Fox sisters became alcoholics, with Margaret in 1888 creating a sensation when she demonstrated at New York’s Academy of Music that the rappings were a fraud, true believers in spiritualism said she was under the influence of alcohol. Later Margaret, in need of money, recanted and once again held seances. When she died in 1893, the National Spiritualism Association was organized on a loose congregational basis.

Closely related and yet distinct from spiritualism, the Theosophical Society was first organized in New York City in 1875 by Helena Petrovna Blavatsky (1831–91) and Henry Steel Olcott (1832–1907), who were drawn together by their interest in the spirit world. Blavatsky, the major influence on the movement, arrived in New York in 1872 with a reputation for esoteric wisdom gained from ancient “mahatmas” of India and Tibet. Though ultimately denying spiritualism itself, Blavatsky based THEOSOPHY on her communion with and illumination by Hindu and Buddhist masters past and present. Blavatsky and Olcott moved to India in 1878 and set up the international headquarters of the Theosophical movement; Olcott served as president in India, and William Quan Judge became the leader of American Theosophists. After Blavatsky died in 1891, Olcott and Judge (who in the 1890s believed his body was occupied by an Indian yogi) had differences, and the American followers of Judge seceded in 1895 and fragmented the Theosophists. The movement, however, survived with

Helena Petrovna Blavatsky, the spiritual teacher and cofounder of the Theosophical Society in New York City, 1875 (*United Lodge of Theosophists*)

Annie Wood Besant (1847–1933) as its major force, and in the 1960s, with the interest in occult and eastern religions growing, Theosophy flourished.

Among NATIVE AMERICANS, the Ghost Dance—their most significant religious development in the late 19th century—had tragic results. The Ghost Dance had different phases in 1870 and 1890, and both originated in the Walker River country of Nevada. The Ghost Dance of 1870 initially prophesied the arrival of material goods for Indians and later the destruction of all but Indians. The more significant 1890 Ghost Dance originated with its prophet Wovoka, a Northern Paiute, who was also known as Jack Wilson. With his people plagued by disease in 1887, he had a vision in 1888 in which God gave Wovoka control over the weather and told him that the people should dance upwards of five days. At first Wovoka’s message was one of peace and brotherhood and aimed at curing the sick, but during the 1889 eclipse of the Sun he had an apocalyptic vision that

eruptions and floods would kill the whites; that the Messiah would come and save the believers, heal the sick, and raise the dead; and that all things would return to their pre-Columbian state. Wovoka prescribed that believers should dance every three months and predicted the Messiah would come during the winter of 1890–91. Convinced that Wovoka brought rain to drought-ridden Nevada in 1889, believers spread the word, and the Ghost Dance movement spread rapidly eastward, including to the Sioux in South Dakota. The Indian agent at the Pine Ridge Agency panicked, called for troops, and before the Ghost Dance War (1890–91) was over, SITTING BULL had been killed and 200–300 Indians were massacred at Wounded Knee. After the Messiah did not appear, and anxious to avoid a repetition of the SIOUX WARS, Wovoka ceased to predict a date and counseled Native Americans to take up farming and adopt white ways. Ghost Dances continued but apparently ceased by 1930. A syncretic religion, the Ghost Dance of Wovoka combined elements of Christianity and Native American culture that simultaneously accommodated, preserved, and cut across tribal lines.

**Remington, Frederic** (1861–1909) *painter, sculptor, illustrator*

Through his paintings, sculpture, and illustrations, Frederic Remington was a key figure in creating a conception of the vanishing American West. Born in Canton, New York, on October 4, 1861, Remington took his first trip west in 1881 and spent a few peripatetic years as a sheep rancher and co-owner of a saloon and a hardware store, while making drawings.

In 1886 four of his illustrations appeared in various magazines published by Harper's, and Remington committed himself to a career in art. He quickly became a celebrity as an illustrator of life in the western states and commanded large sums for his work. Simultaneously, he exhibited paintings in prestigious New York City venues and won a silver medal at the 1889 Universal Exposition in Paris. He settled into a pattern of travel interspersed with months of work at home in his studios in New Rochelle, New York, and, after 1900, at a 16-acre compound on the St. Lawrence River. He went to CUBA in January 1897 on assignment

for William Randolph Hearst to cover the Cuban Revolution. When the artist found all quiet, Hearst is said to have cabled back: "You furnish the pictures and I'll furnish the war." The famous comment, probably apocryphal, exemplified not only the power of Hearst's publishing empire but also the bellicose IMPERIALISM of the nation. Remington did indeed furnish illustrations of the SPANISH-AMERICAN WAR. In the last decade of his life, Remington produced fewer illustrations and more paintings, finally turning to pure landscapes. In 1898 he also took up sculpture. A rotund, affable but opinionated man, Remington died in New Rochelle of peritonitis from a ruptured appendix on December 26, 1909.

Remington depicted rugged men and animals: cowboys and cattle, Indians, miners, cavalry soldiers, canoeists, hunters and their dogs. His studios were filled with written notes, sketches, photographs, models, and especially artifacts, such as Apache baskets, lariats, saddles, and pewter drinking mugs. His art usually contained human figures in action, often in violent conflict. In *A Dash for the Timber* (1889, Amon Carter Museum, Fort Worth, Texas) cowboys rush at breakneck speed into the foreground of the canvas, a large band of Indians in pursuit. By mid-career, many compositions feature a few figures set against a high horizon and a limited if brilliant palette. Typical is *Fight for the Waterhole* (1903, Museum of Fine Arts, Houston, Texas), which shows cowboys, rifles to shoulders, ringing the rim of a waterhole while riders advance. This pared-down aesthetic strategy was consonant with his work in illustration. Remington's thousands of published illustrations included images for Theodore Roosevelt's *Ranch Life and the Hunting Trail* (1888) and nearly 400 images for an 1891 edition of Longfellow's *Song of Hiawatha*.

Remington's art depicted the white man in a heroic struggle against untamed forces; the protagonists became symbols of the frontier's demise. Some modern historians see Remington's art as infiltrated with the era's anxiety over race and IMMIGRATION, empire-building, and the wane of masculine power, but for many his stature in crafting icons of the American West is undiminished.

## Republican Party

The election of Ulysses S. Grant to the **PRESIDENCY** in 1868 and 1872 by substantial majorities of the popular vote and huge majorities in the electoral college obscures the transient nature of the Republican Party's popular base. Grant was an exceptionally popular military hero, but as the passions of the Civil War era receded, the appeal of lesser heroes declined. In addition, Republican strength in the South, based on disfranchising former Confederates and enfranchising former slaves, eroded rapidly with pardons for rebels, their intimidation of black voters, and the consequent replacement of black Republican Reconstruction state governments with white-supremacy Democratic regimes. In the aftermath of the 1876 election the Republicans lost control of their last three southern states and for generations to come would have to contend with a "solid" Democratic South. In presidential elections from 1876 to 1892 (except for 1880) the Democrats won more popular votes than the Republicans, and in 1880 the Republican plurality was a mere 7,000 votes. The Republicans, however, with their votes more strategically located, won three of those five elections in the electoral college.

The Republican Party was a loose alliance of state organizations, as was the **DEMOCRATIC PARTY**. They got together every four years in a national convention to nominate candidates for the presidency and vice presidency, and their successful candidates for the Senate and House of Representatives would caucus and, if in a majority, organize those bodies. They would cooperate, but not at the expense of their constituents. As long as a senator or congressman had a secure base he could defy the president or the caucus. The decentralized nature of American parties fostered factionalism. In one sense, there were as many factions in the Republican Party as there were state organizations, but they formed loose and often shifting alliances within the party. These alliances often identified with an attractive personality like Grant or **JAMES GILLESPIE BLAINE**. There also were party members who felt more strongly about specific issues like **CIVIL SERVICE REFORM**, the **CURRENCY ISSUE**, or the **TARIFF ISSUE** than about loyalty to an organization or devotion to a personality.

From the 1870s to the early 1880s Grant's supporters, led in particular by **ROSCOE CONKLING**, proudly thought of themselves as Stalwarts, but that faction, so cohesive at the 1880 convention, disintegrated shortly thereafter when Conkling committed political suicide by resigning from the Senate. Throughout the 1870s and 1880s the followers of Blaine, who was very popular, formed another faction—called Half Breeds by their enemies—which with the political demise of Conkling (who hated and opposed Blaine) became dominant. Reformers, with more strength in the press than in party organizations, formed a third and undependable faction. They were hostile to corruption, wished

to reform the civil service, and wanted to lower the tariff. Reacting against Grant, his policies, and his appointments, many of them bolted in 1872 and formed the **LIBERAL REPUBLICAN PARTY**. They returned to the Republican fold to support **RUTHERFORD B. HAYES** in 1876 and **JAMES ABRAM GARFIELD** in 1880, but as **MUGWUMPS** in 1884 they deserted to the Democrats and voted for **GROVER CLEVELAND** rather than vote for Blaine, whom they regarded as corrupt.

By the 1890s Republican factionalism subsided. With the rapid industrialization of the United States, the protective tariff became the dominant and unifying Republican issue and **WILLIAM MCKINLEY** its most prominent spokesman. Cleveland, meanwhile, identified the Democrats with a low-revenue tariff and had the misfortune to win a decisive victory in 1892. The panic of 1893 and a severe depression followed, discrediting Cleveland, the Democrats, and the revenue tariff and making the Republican Party the majority party for the next three decades. When the Democrats repudiated Cleveland and embraced inflation in 1896, McKinley, who had easily won the Republican nomination, triumphed on a gold-standard, protectionist platform and confirmed the profound political shift that had begun in 1894. The 1898 **SPANISH-AMERICAN WAR** and the acquisition of an overseas empire added to the popularity of the Republicans as the 20th century began.

**Rhodes, James Ford** (1848–1927) *businessman, historian*

Historian of the Civil War James Ford Rhodes was born near Cleveland, Ohio, on May 1, 1848. His father, a wealthy coal and iron merchant, was a cousin of Stephen A. Douglas and a lifelong Democrat. Although tutored privately as a child, Rhodes graduated from public high school and attended college for two years, when his father interrupted his education to train him to manage his business. Together they went to Europe, where Rhodes from 1867 to 1868 inspected iron and steel plants in England and Germany

and studied metallurgy in Berlin. He also attended lectures on the French political philosopher Montesquieu in Paris, before returning home conversant in French and German. At his father's behest he went south to scout coal and iron deposits but found the Reconstruction of the South more interesting than its minerals. Already a successful businessman, Rhodes, on January 4, 1872, married Ann Card; they had one son. His firm Rhodes & Company included MARCUS ALONZO HANNA (the architect of WILLIAM MCKINLEY's election as president), who had married Rhodes's sister. Business for Rhodes was a means to becoming a historian. By 1885 his fortune was sufficient to hire research assistants and to write.

Without even a college degree Rhodes, nonetheless, set to writing a history of the United States in the Civil War era. He had voraciously read history, honed his writing skills preparing business reports, and learned in his work to judge character. Rhodes thought it an advantage that the Civil War era had barely closed. He both had lived through it and knew some of its participants. A greater advantage was the balance between the North and the South he achieved, partly because of his proximity to his Democratic father and his Republican partner, Hanna. By 1891 Rhodes, researching and writing in Cleveland, had completed his first two volumes, covering the period from the Compromise of 1850 to the outbreak of the war. To take advantage of superior research facilities he moved to Cambridge, Massachusetts. When published in 1892, his description of the sectional conflict leading up to the war was an enormous success, both among professional historians and the public. While enjoying the social and cultural life of Boston, Rhodes published three volumes on the war itself, in 1895, 1899, and 1904. In 1906 he published two volumes on Reconstruction, ending with 1877. The two additional volumes he published in 1919 and 1922, extending his history through the Theodore Roosevelt administration to 1909, were poorly received.

Rhodes's first seven volumes, covering 1850–77, remained the preeminent work on the Civil War and Reconstruction well into the 20th century. They are carefully researched, well written, and remarkably fair considering they were written when the searing effects of civil strife were still felt. Rhodes was a transitional historian between literary historians, such as FRANCIS PARKMAN, and scientific historians, such as FREDERICK JACKSON TURNER, who was trained in a Ph.D. seminar at Johns Hopkins University. With a foot in each camp Rhodes's research was extensive and meticulous, while he interpreted and made moral judgments freely.

Composing his history when JOHN PHILIP SOUSA composed *The Stars and Stripes Forever*, ALFRED THAYER MAHAN wrote *The Influence of Sea Power upon History*, and the United States acquired an overseas empire,

Rhodes reflected his times. He gave the conflict from 1861 to 1865 a conciliatory, nationalist interpretation. It was no longer "the Rebellion," but "the Civil War." It was caused by slavery, which Rhodes abhorred and viewed as a tragic institution, for which New England slave traders were partly responsible. Attempting to break up the nation by seceding was reprehensible, but Southerners were misled by Jefferson Davis to fight for an "unrighteous" cause. In contrast, Lincoln's leadership was inspired and represented the aspirations of people everywhere. Although the North was right in the Civil War, Rhodes admired Robert E. Lee, the Southern way of life, and the heroism of those who died for the South's cause.

After the war, Rhodes argued, the South was right, and the North had been wrong in imposing Radical Reconstruction on white Southerners. Like most Americans in the Gilded Age, Rhodes viewed AFRICAN AMERICANS as inferior, and by opposing the vote for the freedmen, he supported white supremacy. With his condemnation of Radical Reconstruction, Rhodes attempted to heal the breach between North and South. He dominated Reconstruction historiography until his views were discredited after World War II. When Rhodes died in Boston on January 22, 1927, he was still the preeminent historian of the Civil War era.

### **Richards, Ellen Henrietta Swallow** (1842–1911) *chemist, home economist*

Born near Dunstable, Massachusetts, on December 3, 1842, Ellen Henrietta Swallow Richards graduated from the coeducational Westford Academy and taught school. She returned home to nurse her ill mother and to keep the books of her father's store and became very unhappy until her parents agreed to let her enter Vassar College in 1867. She was mature (25 years old), entered with advanced standing, and studied astronomy and chemistry under the celebrated scholar MARIA MITCHELL. Upon graduation in 1870, she failed to find work as a chemist, so she applied for admission and was accepted by Massachusetts Institute of Technology (MIT), which waived her tuition for the sexist reason that it did not want a woman on its rolls. Nevertheless, she became the first woman to earn a degree from MIT, getting her bachelor of science in 1873 and, having submitted a thesis on mineralogy to Vassar, received in the same year a master of arts. She wished to earn her doctorate in chemistry at MIT but was discouraged, since the institute did not want its first chemistry Ph. D. to be a woman. She stayed on at MIT

as a laboratory assistant and in 1875 married Robert H. Richards, an MIT professor of mining and metallurgy.

At MIT Richards, who possessed enormous drive, pursued her career in chemistry and pioneered a new field that became known as “home economics”; at the same time, she encouraged other women to secure an education in science. In 1876 she set up a women’s laboratory at MIT, and in 1882 she helped found the American Collegiate Association, which became the American Association of University Women. She encouraged MIT to admit women on an equal basis with men, which it did in 1883, and she always functioned as the unofficial counselor for women at MIT.

In 1884 MIT appointed Richards instructor of sanitary chemistry, but despite her accomplishments never promoted her. She conducted the first scientific tests of drinking water in America—40,000 samples from Massachusetts—in 1887 to 1888. Earlier in the women’s laboratory she had begun to apply scientific principles to daily life in the home and especially in the kitchen. In 1880 she published *The Science of Cooking and Cleaning*, in 1885 *Food Materials and Their Adulterations*, and in 1893 she set up a model kitchen at the WORLD’S COLUMBIAN EXPOSITION in Chicago. To establish home economics as a field of study—an academic discipline—Richards organized a series of summer Lake Placid conferences (1899–1907), which resulted in the establishment in 1908 of the American Home Economics Association, with Richards as its first president. Departments of home economics were established at colleges and universities but, because of the opposition of Bryn Mawr’s M. CAREY THOMAS, not at prestigious women’s colleges and, despite the presence of Richards, not at MIT. Richards died on March 30, 1911.

**Richardson, Henry Hobson** (1838–1886) *architect*  
A larger-than-life figure, H. H. Richardson popularized a muscular, rusticated stone architecture that became known, even in his own day, as Richardson romanescque. A doorway with a low-sprung arch composed of huge voussoirs is a hallmark of the style. Born on September 29, 1838, on a sugar plantation north of New Orleans, Louisiana, Richardson graduated from Harvard in 1859. He trained in the private atelier of Jules Andre at the École des Beaux-Arts and traveled extensively in Europe. In 1865 he opened an office in New York City, and after 1874 he worked primar-

ily out of his home in Brookline, Massachusetts. Throughout his career he gathered talented draftsmen around him, including STANFORD WHITE and Charles F. McKim, opening his large library and photograph collection to them all. A man of Falstaffian appetites, his magnetic personality charmed clients and many confessed that their buildings grew larger under the force of his personality. Richardson died at home at age 47 (April 27, 1886) of Bright’s disease; several of his most important commissions were completed posthumously, and long after his death Richardson romanescque remained popular.

In response to a country that was urbanizing and suburbanizing, Richardson developed new architectural forms, especially for public buildings. Trinity Church (1877, Boston), a free rendering of the French Romanesque ecclesiastical architecture of Auvergne, served as an auditorium for the spellbinding preacher PHILLIPS BROOKS. This landmark of the American AESTHETIC MOVEMENT, with stained glass by JOHN LA FARGE, William Morris, and others, as well as a mural program directed by La Farge, set a pattern for highly collaborative projects. Richardson went on to develop commuter train stations, public libraries, and civic halls, many of them built in the Boston vicinity. The Oakes Ames Memorial Hall (1881, North Easton, Mass.), a large, turreted, dormered lecture hall, uses asymmetrical massings to take advantage of a steep hillside site. The Allegheny County Buildings (1888, Pittsburgh, Penn.) comprise a courthouse and a jail, the two connected by a “bridge of sighs.” The courthouse, with a campanile modeled after medieval urban civic buildings, is organized around a courtyard, while the jail uses contemporary ideas of penal reform in its design of three radial cell blocks surrounded by a wall.

Richardson romanescque was not a slavish historicism but rather an elaboration and adaptation of the northern European architecture of the 11th and 12th centuries, especially Norman and British vernacular buildings. Richardson achieved picturesque effects and pragmatic space provisions through polychromatic stone massings; brick, wood, and other materials were also used. The Glessner House (1887, Chicago) presents severe, regular facades to the street, but its interior court is composed of a series of brick turrets arranged around a garden. Richardson’s emphasis on structural elements, while perfectly in line with Ruskinian demands for truth in architecture, was championed by 20th-century critics writing as modernism took hold. Thus, his Marshall Field Wholesale Store (1887, Chicago), a huge stone warehouse composed of stacked arches of descending height and width, is cited as a landmark protomodernist structure.

**Riis, Jacob A.** (1849–1914) *social reformer, journalist, photographer*

Jacob August Riis, housing reformer, was born on May 3, 1849, in Ribe, Denmark, the son of Niels Edward Riis and Carolina Lundholm. In 1870 Riis immigrated to the United States. For several years he wandered about the Northeast, but he eventually settled in New York City. In 1877 the *New York Tribune* hired him. After just one year at the *Tribune*, Riis moved on to the *New York Sun* where for the next 11 years he worked as the paper's police reporter. Riis was twice married: first to Elizabeth Nielsen (1876), with

Jacob A. Riis (Library of Congress)

whom he had six children, and in 1907 to Mary Phillips, with whom he had one child who died in infancy.

As a police reporter, Riis knew the abject poverty among the immigrants on New York's Lower East Side and especially in the overcrowded, disease-ridden tenements they were forced to live in. Using photography and his skills as a reporter, Riis produced his most influential book, *How the Other Half Lives* (1890), documenting life in the slums and influencing a whole generation of urban reformers. The popularity of *How the Other Half Lives* allowed Riis to leave his job at the *Sun* and devote all of his time to writing and lecturing on the horrors of tenement life and the need for better HOUSING regulations.

Although landlords and several politicians opposed him, Riis did gain the support of Theodore Roosevelt, who served as New York's police commissioner from 1893 to 1895. Roosevelt had read *How the Other Half Lives* and assisted Riis in his work. The two men became close friends and for 20 years collaborated on several projects. In 1902 Riis dedicated his book *The Battle with the Shum* to Roosevelt.

In his autobiography *The Making of an American* (1901), Riis retold his experience as he assimilated into American society. He argued that the cure for the ills of immigrant life in America's cities was the promotion of housing reform, the construction of municipal parks, the expansion of public education, and the implementation of neighborhood improvement programs. Riis was also an ally of the SETTLEMENT HOUSE movement. Among his other works were *The Children of the Poor* (1892), *Out of Mulberry Street* (1898), *A Ten Years' War* (1900), *Children of the Tenements* (1903), and *The Old Town* (1909). Riis lived the last decade of his life in failing health but still maintained a grueling schedule of lecturing and writing in the interests of reform. He died on May 26, 1914, in Barre, Massachusetts.

**Robber Barons, The** (1934)

In 1934 in the depths of the Great Depression when the prestige of industrialists and bankers had fallen to an all-time low, Matthew Josephson published *The Robber Barons: The Great American Capitalists, 1861–1901*. It fas-

tened that pejorative label on the leading businessmen of the Gilded Age. He thought them always aggressive, often immoral, and sometimes lawless. The way they acquired their fortunes reminded him of feudal barons. Although Josephson claimed he spoke of their constructive virtues in transforming an agrarian mercantile society into a mass-production economy, his descriptions of "their most ruthless actions, their conspiracies and plunderings" are more memorable. In portraying businessmen as "robber barons," Josephson discussed, among others, the careers of industrialists ANDREW CARNEGIE, HENRY CLAY FRICK, and John D. Rockefeller; railroad developers Cornelius Vanderbilt, JAY GOULD, COLLIS POTTER HUNTINGTON, and JAMES J. HILL; and bankers Jay Cooke and JOHN PIERPONT MORGAN.

Despite the efforts of biographers and business historians, Josephson's group portrait of Gilded Age businessmen still lives in the mind's eye of the public. Without any meaningful federal economic controls the Gilded Age is still viewed as the age of the robber baron. Biographers, however, have improved the reputation of the major businessmen Josephson selected for his group portrait. Several of them improved their reputations by philanthropic acts. Carnegie's gifts to thousands of libraries and to the cause of world peace lives on and Rockefeller's support of medical research has saved millions of lives, while Frick and Morgan's generosity made fabulous art collections available to the public.

Business historians and biographers have critically evaluated the men and their enterprises and have generally found them more constructive in organizing a business and responsible to their investors than Josephson admitted. In the hands of some biographers Josephson's robber baron becomes a knight in shining armor. To Allan Nevins, Rockefeller was an industrial statesman, who brought order to a chaotic oil industry, and to Albro Martin and Michael P. Malone, Hill built an empire in the Northwest by striving to make prosperous the pioneers living along his Great Northern Railroad.

Neither noble knights nor robber barons, most of these businessmen were tough, talented, aggressive, successful players in an expanding, competitive economy. Dismissing a complex man like Carnegie as a robber baron ignores his idealism and fails to recognize that in creating the efficient Carnegie Steel Company, he led the U.S. steel industry to world dominance. Even Gould, whom Josephson referred to as Mephistopheles, has been partially rehabilitated. In the 1860s he had watered the stock of the Erie Railroad, bribed the New York legislature, and attempted to corner the gold market on "Black Friday," but in the 1870s and 1880s he proved to be a more constructive and responsible railroad manager. The term *robber baron* may have applied to Gould at the start of his career, and it may have applied

to an occasional episode in the careers of the remainder in Josephson's group picture. But *robber baron* obscures rather than enlightens how these men affected the second INDUSTRIAL REVOLUTION in the Gilded Age.

Cochran and William Miller, *The Age of Enterprise: A Social History of Industrial America*, rev. ed. (New York: Harper & Brothers, 1961).

## Roman Catholicism

In the late 19th century Protestant Americans viewed Roman Catholicism, although the earliest European Christian church, as both an interloper and a latecomer. It was neither. In Florida and in the Southwest its roots in the New World were deeper than those of Protestants, and Catholics were among the first settlers of Maryland in 1634, since it was founded by a Catholic for Catholics. The Catholic Church grew rapidly in the 19th century. There were 200,000 Roman Catholics in the United States in 1829, 3 million in 1860, 7 million in 1880, and 10 million in 1900. Migrants from Ireland and later from eastern and southern Europe accounted for this startling growth. While the church grew, so too did its problems from without and from within. In the 1840s virulent anti-Catholic nativists rioted in Philadelphia and elected a mayor of New York, and their Know-Nothing Party reached its zenith in 1854 and 1855 but disintegrated after 1856. The party disappeared, but Protestant hostility to Catholics remained, surfacing in controversies over public aid for parochial schools raised by the AMERICAN PROTECTIVE ASSOCIATION (APA) in the 1880s and 1890s.

There were also differences between American Catholics and their authorities in Rome. Since Catholics were suspected of loyalty to a foreign potentate (the pope), American Catholic leaders from the birth of the United States publicly and eagerly embraced their nation and its democratic values. But Pope Pius IX (1792–1878, elected 1846), as his temporal power eroded, issued his reactionary encyclical *Quanta Cura* (1864) with its "Syllabus of Errors" that attacked "progress, liberalism, and contemporary civilization," rejected liberty of conscience and toleration of other religions, and asserted church control of science, culture, and education. Liberal Catholics, who had embraced religious liberty and democracy, were dismayed, and American Catholics did their best to affirm American principles at their 1866 second plenary council in Baltimore. Pius, however, at the nadir of his temporal power in 1870 triumphed at the Vatican Council, which proclaimed the dogma of papal infallibility. But that victory

led to struggles with the governments of Germany, France, and elsewhere.

Contending forces beset Roman Catholicism during the Gilded Age. It was ruled by a reactionary authority abroad, it existed in the most democratic country in the world, and it acquired millions of disparate new members from Ireland, Germany, Italy, and Poland. As IMMIGRATION expanded the church, ethnic divisions were apparent among the laity and clergy, with the Irish resenting the French dominance of the hierarchy early in the century and, later, the Germans resenting the Irish. The Germans, for example, resisted Irish efforts to require English in all parochial schools.

The ideas of Pius IX also clashed with those of the laity, who wholeheartedly participated in the American democratic process, and with the thoughts of two prominent American converts to Roman Catholicism. Orestes Brownson (1803–76) had moved from Calvinism to Universalism to Unitarianism to Transcendentalism—becoming committed to radical social causes including SOCIALISM, abolitionism, and WOMEN’S RIGHTS along the way—before embracing Roman Catholicism in 1844. From then until his death he worked at reconciling his Catholicism and his natural rights as an American. Only Catholicism, he believed, could discipline the American people sufficiently to make democracy work and to achieve the radical social reforms he continued to hold dear. For Brownson, America and Catholicism were not in conflict and actually were spiritual siblings.

Isaac Hecker (1819–88), the child of German immigrants, who with his brothers owned a prosperous bakery and flour mill, met Brownson in 1841 and under his influence sojourned among Transcendentalists for a year and in 1844 also converted to Roman Catholicism. He studied abroad for the priesthood, was ordained in 1849, returned to the United States as a Redemptorist missionary, and wrote *Questions of the Soul* (1855) and *Aspirations of Nature* (1857). In them he merged romantic Transcendentalism with Catholicism, arguing that while basic human aspirations transcended experience, they were reflected in the sacraments of the Catholic Church. Hecker, a proselytizer at heart, recognized that the Redemptorist order, composed primarily of German immigrants, would convert more Protestants if a thoroughly American branch of the order were established. His German superior disagreed, and when in 1857 Hecker went to Rome to plead his case he was tossed out of the order. Pius IX, however, allowed Hecker in 1858 to found the Society of Missionary Priests of St. Paul the Apostle in New York. The Paulists were American and had as their object the conversion of American Protestants, and they used American culture as a positive force conducive to the true Catholic faith. Hecker’s last book *The Church and the Age* (1887) argued that the church was not at odds but rather at home with modernity.

Another sign of American independence was the creation of the Catholic University of America in 1889 so that American priests seeking advanced study would not have to go abroad. For conservatives, this move entailed the risk of disconnecting priests from traditional and dependable orthodox European authorities. A papal delegate returned from America to Rome in 1892 with a sobering report to the Pope on the state of the church.

The reactionary Pope Pius had been succeeded by Leo XIII (1810–1903, elected 1878), who was conciliatory by nature and is renowned for his *Rerum Novarum*, which applied Christian principles to the relations between capital and labor, but he was not a liberal. Besieged by nationalism in Italy and beset by anticlericalism in France, Leo perceived that modernism was a threat to the authority of Rome. Quite understandably he found the teachings of Brownson and Hecker disturbing and recognized that the new American university might encourage a drift from Rome. Consequently Leo’s encyclical, *Longinqua Oceani* (1895), cautioned the American church against attributing its strength to American ideas instead of to God’s mysterious design, lamented the separation of church and state, and admonished Catholics to be more cohesive and obedient. In 1899 following the SPANISH-AMERICAN WAR, in which the United States defeated a Catholic power, Leo issued *Testem Benevolentiae*, attacking Hecker’s ideas, Americanism, and modernism directly, warning that they were a mix of heretical notions and that it was wrong to “desire a church in America different from that which is in the rest of the world.” To Leo the tumult of change was a danger, while to Brownson and Hecker in America it was an opportunity. Trusting its long history and durability, Rome chose to stay its usual course and demanded that America heel to. As a result, the American hierarchy became conservative in the first half of the 20th century. And yet while doctrinally and institutionally conservative, there was a pragmatic liberal strain in the American Roman Catholic Church. Isaac Hecker’s belief that America and American culture were ideal situations for the natural growth of Catholicism propelled many liberal Catholics. And the thinking of Hecker, far more than that of Pius IX or Leo XIII, influenced the liberalizing Second Vatican Council (1962–65).

**Roosevelt, Theodore** See VOLUME VII.

## Rough Riders

The First Cavalry Regiment during the SPANISH-AMERICAN WAR, commanded by Theodore Roosevelt, was informally known as the Rough Riders and became famous for its charge up Kettle Hill during the Santiago campaign in CUBA. The volunteers who gathered at San Antonio for this mounted regiment were diverse and a bit exotic. Cowboys, bookkeepers, college boys, policemen, Indians, and Mexicans all signed up to fight Spain. Theodore Roosevelt, the future president but then the assistant secretary of the navy, resigned his post to join the unit. In an uncharacteristic act of humility he refused command because he felt unqualified, having only served three years with the New York National Guard. Roosevelt recommended his friend

Colonel Leonard Wood, an army surgeon and physician, to Secretary of War John Long. Roosevelt was made second in command. Unlike the rest of the army, the Rough Riders were outfitted with private funds provided by many of the soldiers themselves, thus assuring that they had the best equipment, such as Krag-Jorgenson rifles and smokeless powder cartridges.

Because of monumental confusion at the point of embarkation, the Rough Riders arrived at Daiquiri, Cuba, on June 22 without their horses. Forced to travel on foot, they distinguished themselves by their speed of advance. At the battle of Las Guasimas the swift-marching Rough Riders stormed and took Spanish entrenchments, thus opening up the road to Santiago before the infantry arrived.

Colonel Theodore Roosevelt and his Rough Riders atop the hill they captured, Battle of San Juan Hill, 1898 (*Library of Congress*)

On July 1 the Rough Riders, commanded by Roosevelt (Wood had moved up to command a brigade), would charge their way into history. The San Juan Heights was the key to taking Santiago, and on San Juan and Kettle Hills, the Spanish were in trenches and protected on their flanks by blockhouses. As the Americans attacked, they were pinned down by Spanish rifle fire with little protection other than tall jungle grass. In the ensuing confusion, regiments became mixed up. Roosevelt felt that they would all be killed if they remained in the grass, and finding himself the highest ranking officer, he ordered his Rough Riders and the other cavalry regiments to charge up Kettle Hill. When officers of the other regiments refused to do so without orders from their own commanding officers, Roosevelt told them to step aside and let his Rough Riders through. Roosevelt, riding one of the few horses to make it to Cuba, led his soldiers up the hill. The other regiments, fearing they would be seen as cowards, fell in with the Rough Riders. The farther the men advanced the faster they marched. The Spanish quickly retreated in the face of this mass of galloping, horseless cavalry. The Americans suffered many casualties taking the blockhouses, but by 1 P.M. Roosevelt and his men had taken Kettle Hill. Roosevelt paused for a few minutes and then joined in the successful charge up San Juan Hill.

At the end of the war the First Volunteer Cavalry unit was disbanded. Roosevelt returned home to a hero's welcome, was soon elected governor of New York, and would in a few years be president of the United States. And yet he knew that July 1, 1898, was "the great day of my life" and also realized that he would "talk about the regiment forever."

—Timothy E. Vislocky

### **Royce, Josiah** (1855–1916) *philosopher*

An idealist philosopher, Josiah Royce, whose parents were intrepid forty-niners, was born on November 20, 1855, in Grass Valley, California. Gold and prosperity eluded his family. With no adequate school in their mining town, his mother started one. Later, when the family moved to San Francisco, Royce attended Boys High School, excelled in mathematics, read widely in the Mercantile Library, and in 1871 entered the University of California at Berkeley. Although the university was only three years old, among Royce's teachers were Joseph LeConte, a distinguished geologist and an advocate of the theory of EVOLUTION, and Edward Rowland Sill, an equally distinguished poet, who made Royce his undergraduate assistant. Royce also

attracted the attention of university president DANIEL COIT GILMAN, who left Berkeley in 1875, the year Royce graduated, to head the new Johns Hopkins University in Baltimore, Maryland. Before leaving, Gilman, aware of Royce's poverty, arranged loans that enabled him to study in Germany from 1875 to 1876, and Royce gratefully predicted it would "be the making of my whole life."

Royce had taken the classical course of studies at Berkeley, and his graduate thesis was on the theology of Aeschylus's *Prometheus Bound*, but at the German universities of Leipzig and Göttingen he studied philosophy and became "an idealist devoted . . . to pure learning for learning's sake, . . . burning for a chance to help build the American University." Gilman at Hopkins made that desire a possibility. In 1876 he appointed Royce one of 21 fellows at \$500 a year, who while working on a Ph.D., could teach if they wished. For Royce, Hopkins was an incredible experience. In his first year he made lifelong friendships; experienced intellectual growth; enjoyed music, art, and the theater; taught a course on Schopenhauer's philosophy; and gave five lectures on the "Return to Kant." Typically, Royce did not simply repeat Schopenhauer but, while accepting his reality of tragedy, put a positive spin on Schopenhauer's will and muted his pessimism. In Royce's second year at Hopkins he cemented a lasting friendship with WILLIAM JAMES, who was visiting Hopkins and whom Royce had met in 1875. He encouraged Royce to pursue his dream of a career in philosophy. In 1878, at the age of 22, Royce was among the first four to receive a Hopkins Ph.D. His thesis, "Of the Interdependence of the Principles of Knowledge," he later remarked, was "pure pragmatism."

Since there were no jobs for a Ph.D. in philosophy and Royce had a strong background in literature, Gilman got him a job in 1878 teaching English literature at Berkeley. As much as he loved California's scenery, Royce felt he was exiled. "There is no philosophy in California," he complained to James, who addressed him as "the solitary philosopher between Bering's Strait and Tierra del Fuego." You are "lucky," James told him, for opportunities are "only waiting for the disgrace of youth to fade from your person." On October 2, 1880, Royce married Katherine Head, a linguist, poet, and pianist. They had three children.

In 1882 James arranged for Royce to substitute for him while he was on a one-year leave from Harvard. Royce stayed on at Harvard, where he and James remained close friends, despite strong philosophical differences. Royce was also supportive of CHARLES SANDERS PEIRCE (like him, a superb logician), whom he appreciated but also disagreed with.

Royce's philosophy evolved through the years. His parents were deeply religious, and Royce, after a youthful religious crisis, believed that scientific discoveries may undermine dogmas, but religious life endures; that beliefs

are numerous, but the spirit of religion is one. That spirit underpinned his philosophical ideas. By 1885, when he published *The Religious Aspect of Philosophy*, he had moved away from the PRAGMATISM of his Ph.D. thesis to “objective idealism” and ultimate truths (the Absolute). He proved this with logic rather than the “subjective idealism” felt by the transcendentalists. The Absolute became for Royce another name for God, and his book was hailed as a defense of theism. For Royce, the mind was compelled to believe in an absolute, while James believed the mind inclined to change and chance. Royce believed in monism, the oneness of things, while James believed in pluralism. Royce elaborated his views in the two-volume *The World and the Individual* (1899, 1901), based on lectures delivered at the University of Aberdeen in Scotland. Later, in *The Problem of Christianity* (2 vols., 1913) he substituted for the Absolute the “Universal Community” (the invisible true church) in which relationships can be redemptive. By the turn of the century Royce was renowned as America’s foremost philosopher and was the American leader of the idealistic school of philosophers. He inspired advanced students, but undergraduates found his lectures difficult to follow. His public lectures, which were to the point and supported moral and religious convictions, were successful.

Royce was generally aloof from politics, but he did not live in an ivory tower. He opposed racism, thought nationalism an evil, hated militarism, and deplored IMPERIALISM and war. He was deeply disturbed by World War I and, in keeping with his ideas, called for a worldwide community that “would promote interdependence, cooperation, and loyalty” to eternal ideals, and an international organization to preserve world peace. Despite his love of German culture, Royce condemned Germany as the “enemy of the human race.” He died on September 13, 1916.

### **Ryder, Albert Pinkham** (1847–1917) *painter*

Albert Pinkham Ryder was born on March 19, 1847, in New Bedford, Massachusetts. As a four-year-old child, he colored and drew and looked at old art magazines his older brother William brought him. His formal education ended with public grammar school, but his interest in art continued. New Bedford had an arts atmosphere. It was the home of ALBERT BIERSTADT and several other successful artists. An amateur painter gave Ryder lessons in his studio, near a frame shop, where art exhibitions were organized and discussed. A whaling port, New Bedford offered an artist constant views of its harbor and beautiful country views within walking distance.

Around 1867 Ryder’s brother William, who had opened a restaurant in New York City and would later manage the Hotel Albert, moved his parents and three younger brothers to New York, where they all lived together. After Ryder was rejected by the National Academy of Design, he met William Edgar Marshall, a well-known portrait painter, who became his friendly critic and informal teacher and whom he later called “master.” Marshall had painted Ulysses S. Grant, Abraham Lincoln, and HENRY WARD BEECHER. When Ryder again applied to the National Academy of Design, he was accepted and studied there for four years, taking only drawing courses. Color and painting he learned from Marshall but refused to learn the technical aspects of painting from anyone. Throughout his career he was indifferent to them.

Even though he was shy, Ryder was popular in art school. Among his close friends was Helena de Kay. With her brother and husband, magazine editor RICHARD WATSON GILDER, she promoted his early career. The Gilders in 1877 were among the founders of the Society of American Artists, for the next two decades the leading liberal art organization, which Ryder joined in time for its first exhibition. Around this time Ryder had an epiphany, when he was painting near his grandfather’s house on Cape Cod. While feeling discouraged by his inability to copy nature, he saw a view framed by two trees that “stood out like a painted canvas.” Ryder realized that art has a life of its own and that nature is just the departure point. “I squeezed out big chunks of pure, moist color and taking my palette knife, I laid on blue, green, white and brown in great sweeping strokes,” Ryder remembered. “I saw nature springing into life upon my dead canvas. It was better than nature, for it was vibrating with the thrill of a new creation.”

Ryder’s paintings of the 1870s are generally of horses or cows and sometimes people, either in a landscape or a stable, usually around sunset. He continued with landscapes throughout his career but in the 1880s started painting his famous moonlight marine paintings. Although he became entirely a studio artist, he would go to parks to observe trees and sky and on a trip to Europe was greatly interested in observing the effect of moonlight on water. While there, he visited the Rijksmuseum in Amsterdam and the studio of Matthew Maris in London.

Ryder’s technique became more and more painstaking. He would repeatedly paint over his paintings, seeking an ideal composition. Paintings were worked on for years. Ryder called this process “ripening.” His works glowed from many layers of glaze. Unfortunately, the many thick layers of paint on his “little gems” have since cracked, and the glowing translucent varnish has darkened.

In 1888 a friend of Ryder’s, a waiter he met in his brother’s hotel, bet his \$500 savings on a horse in the Brooklyn Handicap. When he lost his money, he shot

himself. Distressed by his friend's suicide, Ryder painted *The Race Track*, his most haunting symbolist work, considered by many to be decades ahead of its time. The painting, which is sometimes called "Death on a Pale Horse," depicts the grim reaper riding a pale horse clockwise around a race track under a somber sky.

Starting in the late 1880s Ryder produced paintings of literary and religious subjects. Although these works are small in scale—as are all Ryder paintings—they are ambitious and grand, as well as sincere and powerful. Ryder began no new paintings after he turned 50, though he continued to work on many canvases that were still ripening in his studio.

As Ryder grew older, his artistic reputation grew, his paintings commanded higher prices, and young artists, such as Arthur B. Davies and Marsden Hartley, sought him

out. Ryder had not been included in the 1893 WORLD'S COLUMBIAN EXPOSITION in Chicago, but in 1913, 10 of his works were hung in the groundbreaking Armory Show in New York City.

Ryder's kidneys began to fail in 1915. He eventually moved in with his friends Charles and Louise Fitzpatrick in Elmhurst, Long Island. He died in their home on March 28, 1917. The Metropolitan Museum of Art held a memorial exhibition of his work a year later. Evidence of Ryder's esteem is his holding second place among forged American artists, with nearly 1,000 known forgeries of his paintings.

—Jan Hoogenboom

**Saint-Gaudens, Augustus** (1848–1907) *sculptor*

Augustus Saint-Gaudens, arguably America's preeminent sculptor in the late 19th century, was known both for his monumental public SCULPTURE and smaller private commissions. A major figure in the American Renaissance, Saint-Gaudens introduced an appealing naturalism in a sculptural lineage stretching back to classical antiquity. Of French and Irish extraction, born on March 1, 1848, in Dublin, the son of a shoemaker, Saint-Gaudens moved to America as an infant. He apprenticed for three years as a cameo cutter in New York City. In 1866 he entered the National Academy of Design in New York City, and in 1868 he enrolled in the studio of Francois Jouffroy of the École des Beaux-Arts in Paris. In 1877 he married Augusta Homer, from a prominent Boston family. The artist also kept a mistress, Davida Clark, a model whose features can be traced in many sculptures.

When in 1876 he won the commission for the *Faragut Monument* (1881, Madison Square Park, New York), Saint-Gaudens became a leading figure in public sculpture. Most of his work focused on the human figure and was executed in marble or bronze. Saint-Gaudens often collaborated with his friend, architect STANFORD WHITE, in the design and setting of monuments. Among his most prominent public works were the *Shaw Memorial* (1897, Boston Common), *Abraham Lincoln* (1906, Grant Park, Chicago), and *Diana* (1891), which stood atop the spire of the original Madison Square Garden but is now at the Philadelphia Museum of Art. He was instrumental in many organizations, including the Society of American Artists, the American Academy in Rome, and the sculptural commissions for the WORLD'S COLUMBIAN EXPOSITION of 1893 and the Library of Congress.

Once awarded a contract for a major sculpture, Saint-Gaudens took a long time to complete it. He began with numerous drawings and proceeded to small-scale clay

maquettes. He often retained these for years, examining, adjusting, and sometimes radically reworking his original conception. In studios in New York City, Paris, and later Aspet, his country home in Cornish, New Hampshire, Saint-Gaudens gathered congenial assistants, who produced the large-scale clay and plaster models used to cast the completed works. Many of Saint-Gaudens's sculptures exist in different versions and scales; they represent various stages in the process from conception to casting. On August 3, 1907, Saint Gaudens died at Aspet, which is now a museum of his work.

Saint-Gaudens's genius lay in uniting the real and the ideal. His numerous bas-relief portraits, such as *Mariana Griswold Van Rensselaer* (1888, Metropolitan Museum of Art), are charming in their immediacy and delicate realism. He was capable of startling synthesis in his allegorical works. The *Adams Memorial* (1891, Rock Creek Cemetery, Washington), a funerary monument commissioned by historian HENRY ADAMS after the suicide of his wife, used both Buddhist literature and Michelangelo's Sibyls as sources. Describing the heavily draped, meditative figure, Adams wrote: "The whole meaning and feeling of the figure is its universality." *General Sherman Led by Victory* (1903, Grand Army Plaza, New York) successfully quotes venerable antique sculpture while expressing the vitality of the Civil War commander. The *Shaw Memorial* commemorates the sacrifice of Robert Gould Shaw and conveys the determination of his men of the 54th Massachusetts Infantry as they fought.

## Samoa

Located in the South Pacific, the islands that make up Samoa are of little economic importance, but they do have strategic value. They are near shipping lanes and, with the fine harbor of Pago Pago, are suitable for a naval base. By the 1880s a three-way competition between Great Britain, Germany, and the United States for Samoa led to a confrontation between the United States and Germany. In 1878 the United States signed a treaty with a six-foot, four-inch “tattooed prince” of Samoa. The treaty allowed the United States to develop a naval station at Pago Pago but committed it to support the native government should it have problems with foreign powers. Within a year the British and Germans also secured trading rights and agreed to respect the independence of Samoa. But American, British, and German consular agents were, with reason, suspicious of the annexationist intrigues of each other, and over the next decade the islands were in a state of constant turmoil.

Germany was more aggressive than either Britain or the United States. The newly united German Empire had embarked on a policy of catch-up colonialism to secure what it believed to be its rightful place among the great powers of Europe, and it wanted Samoa. Early in 1887 Germany sought to install a more compliant monarch on the Samoan throne. A subsequent tripartite conference in Washington did little to relieve the resultant political tensions, nor did it deter the Germans from their plans. German naval vessels arrived in Apia harbor, Western Samoa, soon after and proclaimed an island chief by the name of Tamaese as the new monarch. Fortified with 6,000 warriors, a rival chief named Mataafa rose up against Tamaese and his German backers and took over most of the islands, killing 20 and wounding 30 of the 140 German naval guards who participated in the struggle.

In an attempt to block what he saw as an unjust attempt to annex the islands and to placate public opinion that had been whipped up by the imperialist Republican press,

President GROVER CLEVELAND sent three warships to Apia, where the British corvette HMS *Calliope* and three German warships were anchored in that small and rather unprotected harbor. With a trans-Pacific cable still years away, news from Samoa took 10 to 20 days to reach the United States. Rumors abounded in the press about battles in Apia harbor and the sinking of American ships. War fever grew unabated. The new CONGRESS talked of spending \$50 million to refit the navy to raid German commerce.

Actually, the ships were in a tense standoff that was broken on March 16, 1889, when a furious typhoon struck Apia and sank or drove on shore all the vessels except the *Calliope*, which made it out to the open sea and safety. The magnitude of the tragedy and the eerily equitable distribution of the casualties (50 sailors were killed) ended war talk in the press and made the powers more amenable to compromise. An 1889 conference in Berlin resolved that Mataafa would be king of the islands and Germany, Britain, and the United States would act as protectors of Samoa's independence. Shared responsibility was the equivalent of no responsibility. Once again jealousy and intrigue became the order of the day, and Americans and Germans in particular annoyed each other. Finally, in 1899 the three powers met again and negotiated a treaty that allowed Germany to annex the western half of the islands while the United States acquired the eastern end, with Britain withdrawing entirely from Samoa.

### Santo Domingo, proposed annexation of

The annexation of Santo Domingo, now the Dominican Republic, was a major FOREIGN POLICY initiative of President Ulysses S. Grant; it failed because it was opposed by the chairman of the Senate Foreign Relations Committee, Charles Sumner. With his nation bankrupt and in revolt against his dictatorship, President Buenaventura Baez—the “great citizen” of Santo Domingo—was willing to have it annexed to the United States if its debts were assumed. A combination of speculators anxious for profits and naval officers anxious for a base on the Bay of Samana convinced Grant that annexation was not merely desirable but necessary. Grant's personal secretary Orville Babcock, armed with instructions from Secretary of State Hamilton Fish, arrived in Santo Domingo and negotiated two treaties by

November 1869. The first provided for complete annexation, while the second leased Samana Bay to the United States with the right to purchase should the first treaty fail in the Senate. While Grant wished to gratify greedy friends and naval strategists, he also wanted to find a haven for freedmen in a land ruled by descendants of Africans.

Grant spoke with Sumner and thought he had enlisted his support for annexation, but Sumner after study and reflection opposed it as the project of a mercenary dictator, unscrupulous adventurers, and ambitious naval officers. In Sumner's view, the project would be the opening wedge leading to the acquisition of the black republic of Haiti and the rest of the West Indies. As chairman of the Foreign Relations Committee, Sumner adversely reported the annexation treaty in March 1870 and argued that instead of being absorbed by the United States, Santo Domingo should take its place in an independent Caribbean federation ruled by blacks protected by the United States. Grant was outraged, and although he used his influence to the utmost, the Senate in June rejected the annexation treaty by a split 28 to 28 vote (well short of the required two-thirds majority) and did not consider the Samana Bay lease. When the next CONGRESS organized in March 1872, the Grant administration vengefully convinced Republican senators to remove Sumner from his committee chairmanship, but in April even Grant conceded that the annexation of Santo Domingo was dead.

### Sargent, John Singer (1856–1925) painter

The ultimate cosmopolitan expatriate, John Singer Sargent was acclaimed as America's most successful portrait painter, professionally and aesthetically. Born in Florence, Italy, on January 12, 1856, Sargent lived a nomadic childhood in Europe with his American expatriate family. He received little formal education, yet he played the piano well and was fluent in French, Italian, and German in addition to English. In 1874 he was accepted as a student in the private atelier of Carolus-Duran in Paris, and he matriculated at the École des Beaux-Arts later that year. He was equally adept in oils and watercolors, and he often worked on a large scale. Until 1886 he lived primarily in Paris, then primarily in London, but he often traveled in Europe and visited America nine times. He exhibited frequently at the Royal Academy in London, the Paris Salon, and with the Society of American Artists in New York City. A reserved and cultivated man, his friends were many of the era's leading literary and artistic figures, including the actress Ellen

Terry, the writers Edmund Gosse and HENRY JAMES, as well as several leading painters of the day.

Sargent succeeded to the British grand-manner portrait tradition of Van Dyke and Gainsborough. His patrons were the wealthy industrialists of America and the noble families of England, whose social status was brilliantly conveyed on canvas through posture, clothing, and carefully selected props. Psychological penetration was not his strong suit; while he always captured a likeness, many of his sitters wear the same expression of apprehensive dignity. Instead, Sargent's abundant technical abilities allowed him to achieve maximum visual impact by means of fluid brushwork and a few startling notes of color. Family portraits, such as *The Daughters of Edwin D. Boit* (1882, Museum of Fine Arts, Boston), show the relationships among people by ingenious compositions. Sargent's best-known work is probably *Madame X* (1884, Metropolitan Museum of Art, New York), an uncommissioned portrait of Madame Pierre Gautreau, a beauty known for her audacious choices in makeup, clothing, and lovers. Sargent used a highly unconventional pose: face in profile, nose tilted up, her body—in a severe black dress—twisted toward the viewer.

By 1909, with 500 portraits completed, Sargent virtually abandoned the genre, turning instead to landscape painting and themes from religious history and modern life. Throughout his career Sargent had painted harsh, dramatic, and fleeting lighting conditions. His *El Jaleo* (1882, Isabella Stewart Gardner Museum, Boston) shows a flamenco dancer in footlights, while *Carnation, Lily, Lily Rose* (1886, Tate Gallery, London) shows children lighting paper lanterns in the midst of a flower garden at dusk. Sargent's landscapes, whether depicting Capri, Venice, or the Tyrolean Alps, stretched the limits of representation through expressive stroke and color. Monumental works engrossed him at the end of his career, including a series of murals for the Boston Public Library tracing the history of Western religion and several huge canvases depicting World War I themes. Sargent died in London on April 15, 1925.

### **Schurz, Carl** (1829–1906) *journalist, politician*

Political reformer Carl Schurz was born in Liblar (near Cologne), Germany, on March 2, 1829. He attended the University of Bonn, where he imbibed the democratic ideas of Gottfried Kinkel, participated in the Revolution of 1848,

gained fame by rescuing Kinkel from a Spandau jail, and fled abroad for his life. He taught and practiced journalism in England and France, but his fortunes improved in 1852 when he married and migrated. His wife was Margarethe Meyer, a wealthy heiress, and the newlyweds settled in Philadelphia, Pennsylvania.

Four years later the Schurzes moved to Watertown, Wisconsin, where she opened the first KINDERGARTEN in the United States (she had trained under its originator Friedrich Froebel) and he dabbled in real estate, journalism, and especially in politics. Hostile to slavery, Schurz campaigned effectively for the REPUBLICAN PARTY in two languages and was appointed to its national committee by 1860 and influenced German Americans to vote for Abraham Lincoln. He was rewarded in 1861 with the ministry to Spain. With the outbreak of the Civil War, Schurz came home, secured a brigadier generalship, and was promoted to major general and commander of the 11th Corps (composed largely of German Americans), but ill luck plagued his corps, and neither Schurz nor his men emerged from the war with an enviable military reputation.

Schurz, nevertheless, retained his political clout. In the summer of 1865 he toured the South at the request of President Andrew Johnson and, finding its rebellious spirit unabated, recommended the radical position that African-American suffrage should be a condition for readmission to the Union. Returning to journalism, he was by 1867 editor and part owner of the St. Louis *Westliche Post*, but his keynote address at the 1868 Republican National Convention revealed a drift away from Radical Republicanism. Elected to the Senate from Missouri, Schurz took office in 1869 and soon broke with the Grant administration over patronage and principles. Deprived by Grant of appointments (“spoils”) in Missouri, he embraced CIVIL SERVICE REFORM. In addition, he denounced Grant's pet scheme to annex SANTO DOMINGO and Schurz was willing to sacrifice black Republicans to conciliate and woo the former Confederates. He led in the formation of the LIBERAL REPUBLICAN PARTY of 1872 but was chagrined when its convention nominated Horace Greeley, who was neither the civil service nor tariff reformer Schurz desired. Schurz nevertheless supported Greeley, as did the Democrats, but he was decisively defeated by Grant. Schurz continued to oppose Grant in the Senate until 1875, when he lost his seat, ironically, because the former Confederates he had conciliated replaced him with a Democrat.

In 1876 Schurz supported the reform-minded Republican presidential nominee RUTHERFORD B. HAYES, and upon his election Hayes made Schurz his secretary of the interior. Serving from 1877 to 1881, Schurz introduced civil service reform principles in his department, cleaned out a corrupt Indian Bureau (Office of INDIAN AFFAIRS) ring, promoted the CONSERVATION of forests, and, although slow

to do so, ended the policy of removing NATIVE AMERICANS from their lands to reservations.

From 1881 to 1883 Schurz coedited the *New York Evening Post* with EDWIN L. GODKIN and Horace White, but he and Godkin did not get along and Schurz had to resign. He made ends meet by lecturing and writing (publishing a two-volume biography of Henry Clay in 1887 and writing editorials for *Harper's Weekly* from 1892 to 1898) and by serving as the American representative of the Hamburg American Steamship Company.

Although he never again held public office after leaving the Interior Department, Schurz remained an independent force in politics, advocating civil service reform, sound money, and anti-IMPERIALISM. Accordingly he was a leading MUGWUMP supporter of the reform Democrat GROVER CLEVELAND rather than the Republican candidate JAMES G. BLAINE in 1884. In 1896, however, he supported Republican WILLIAM MCKINLEY and the gold standard instead of WILLIAM JENNINGS BRYAN and FREE SILVER MOVEMENT. Schurz soon opposed McKinley and the annexation of the Philippines, and in 1900 and 1904 he switched his support to the Democrats on that issue. Schurz died in New York City on May 14, 1906.

## science

While the United States was a world leader in patenting inventions, developing new technologies, and utilizing scientific discoveries in industrial processes, it was not on the cutting edge of the advance of science itself in the late 19th century. The frontiers of science were advanced primarily in Germany, Britain, and France. Nevertheless, individual American scientists made significant contributions in geology, paleontology, chemistry, physics, and astronomy.

The sciences of geology and paleontology were encouraged by the federally funded U.S. GEOLOGICAL SURVEY as well as by state-supported geological surveys. Lawmakers generally intended the geological surveys to identify deposits of minerals of practical value to industry and society, but some geologists were more interested in researching the science of geology as distinct from economic geology. The first director of the U.S. Geological Survey, CLARENCE (Rivers) KING, was an advocate of economic geology, while his successor JOHN WESLEY POWELL pushed basic research. Those interested in research on both the state and national level made important discoveries.

Thomas C. Chamberlin (1843–1928), who initially became interested in glaciation research during his work with the Wisconsin Geological Survey, was appointed by Powell to head the glacial division of the U.S. Geological

Survey. Chamberlin moved on to become president of the University of Wisconsin and later headed the Geology Department of the then-new University of Chicago, but he remained the outstanding authority on glaciers. That expertise on cold climates in the distant past led him to question the widespread idea that the earth had been a molten mass that was gradually cooling. With a University of Chicago astronomer and mathematician, Forest R. Moulton, he posited a new “planetesimal” hypothesis that the earth coalesced from small particles in orbit about the sun and had a much cooler climate, which would account for evidence of early glaciation.

OTHNIEL CHARLES MARSH in 1866 became America's first professor of paleontology at Yale University. In 1882 Powell appointed Marsh the U.S. Geological Survey's first vertebrate paleontologist, and while serving in that capacity he amassed a huge collection of almost 500 species. Marsh was an expert in constructing the skeletons of extinct animals, and he identified 80 forms of dinosaurs. His work gave significant support to Charles Darwin's hypothesis of evolution by discovering birds with teeth and especially by finding a sequence of American fossil horses. Marsh's arch enemy, Edward Drinker Cope, with whom he engaged in an unseemly feud over who found what first, was also a paleontologist of note who described many new species and did important work on reptiles and fish. Cope, however, was hasty in his work, abrasive in his personal relations, and received no help from the Geological Survey after Marsh became its chief paleontologist.

The greatest American scientist of the Gilded Age was JOSIAH WILLARD GIBBS, whose theoretical papers fundamentally influenced chemistry, physics, and mathematics. His most renowned publication was “On the Equilibrium of Heterogeneous Substances,” which provided a theoretical basis for all possible chemical reactions and the mathematics to calculate the energy expended and the heat gained or lost. In that paper he reformulated the second law of thermodynamics and essentially established the discipline of physical chemistry. Mathematics was at the core of much of Gibbs's work. His notes on mathematical representation were published as *Vector Analysis*, which he preferred to think of as “multiple algebra.” He was interested in the speed of light, electricity, and magnetism, and he believed that light was electromagnetic. Another chemist of note, Ira Remsen (1846–1927), suggested the experiments that developed saccharin and headed the graduate program in chemistry at Johns Hopkins University.

Americans excelled in astronomy. MARIA MITCHELL had discovered a comet in 1847 and in the Gilded Age was professor of astronomy at Vassar College. In 1882 Henry Draper (1837–82) photographed the Orion Nebula, and in 1891 astrophysicist George Ellery Hale (1868–1938) used his spectroheliograph to photograph the sun's promi-

nences (clouds of gas high above the sun's surface). The aviation pioneer Samuel P. Langley (1834–1906) was also an astrophysicist, who in 1878 invented the bolometer to detect temperature differences on the sun. The bolometer was an electric thermometer so sensitive that it could measure variations in temperature of up to one-millionth of a degree. Asaph Hall at the U.S. Naval Observatory in Washington discovered in 1873 the two moons of Mars, and in the early 1890s James E. Keeler (1857–1900) discovered that Saturn's rings were not solid but rather were composed of small particles, with each ring having its own orbit about the planet.

During the Gilded Age, the day of the gifted amateur—the dilettante—scientist was passing, and the university with its faculty was becoming the center of research. In 1870 only Harvard and Yale could claim to be institutions of research as well as of teaching. They were joined by Johns Hopkins, which from its founding in 1876 became a center of research. By 1900, however, state and other private universities were building significant libraries and laboratories, promoting research, and laying the foundation for the enormous contributions of America to science in the 20th century.

**Scott, Thomas Alexander** (1823–1881) *railway executive*

Thomas Alexander Scott was born on December 28, 1823, at Fort Loudon, Pennsylvania. He went to work at the age of 11 and held a variety of clerkships until 1850, when he became station agent for the Pennsylvania Railroad (PRR), at Duncansville, Pennsylvania. Able, energetic, handsome, and gregarious, Scott advanced rapidly in that organization. In 1852 he became the superintendent of the PRR's division west of Altoona (hiring ANDREW CARNEGIE as his personal telegrapher and secretary), in 1858 its general superintendent, and in 1860 its first vice president. With the outbreak of the Civil War (the first railroad war) in 1861 the War Department called Scott to Washington to organize the transportation of men and munitions from northern cities to the front lines; in August he was appointed assistant secretary of war. Scott resigned in June 1862 but returned to the War Department in September 1863. The administration of RAILROADS by Scott and others rapidly moved troops

and enabled the North to overcome the South's advantage of shorter distances (interior lines) between fronts.

After the war Scott continued his meteoric rise in the PRR and branched out. In 1871 he was named president of the Pennsylvania company that operated the PRR system west of Pittsburgh and in 1874 became president of the PRR. Scott, however, was a man of grandiose visions whose interests included more than the PRR. In 1871 he obtained controlling interest in the Union Pacific (which he sold to Vanderbilt interests in 1872) and in 1872 in the Texas & Pacific (T&P), which he wished to build into a transcontinental road. The panic of 1873 and the ensuing depression frustrated Scott's dreams for the T&P. He lobbied Congress assiduously, but unsuccessfully, for a land grant for the T&P. Apparently, his lobby also worked during the 1877 electoral college count for the selection of RUTHERFORD B. HAYES (on the dubious assumption that Hayes would be more likely to approve a land grant than SAMUEL J. TILDEN), but Scott's lobbyists had no appreciable effect on the outcome, and Hayes did not support a land grant. Hayes disappointed Scott further during the GREAT STRIKE OF 1877, which Scott—in collusion with other railroad presidents—precipitated with carefully coordinated wage cuts. Hayes refused to call up volunteers to suppress the strike as Scott demanded and used the army sparingly to keep the peace. Although Scott managed the PRR conservatively, his bold, risky efforts to create a transcontinental system during an economic downturn failed and took a toll on his health. In 1880 he resigned as president of the PRR and sold the T&P to JAY GOULD in 1881. Shortly thereafter, Scott died at Darby, Pennsylvania, on May 21, 1881.

**sculpture**

The mainstream, high-style sculpture of late 19th-century America, largely public monuments and architectural embellishments, was an important chapter in the story of the American Renaissance. Commissioned mainly by government and other corporate bodies, sculpture advanced civic virtues. The formal neoclassicism of Rome that had dominated sculpture at mid-century was replaced by the freer, yet still academic, Beaux-Arts classicism of France. The human figure, executed in marble and bronze, was the dominant subject matter. A degree of immediacy and naturalism was thus injected into the long heritage of Greco-Roman statuary.

Most of the prominent sculptors trained in Paris, either at the École des Beaux-Arts or in affiliated ateliers. Americans returned home to establish their own ateliers for the production of large-scale sculpture. With drawings and clay maquettes, the artist conceived the basic form; then specialized assistants, working in the studio, the foundry, and the marble yard, enlarged it in plaster and cast or carved it. Professionalism was furthered by the exhibition of maquettes and finished works in national and international exhibitions and with the founding of the National Sculpture Society in 1893.

Ambitious buildings of the era included elaborate sculptural programs. Alexander Milne Calder supervised sculpture, which encompassed figural groups as well as capitals and pilasters, for the Philadelphia City Hall, built from 1871 to 1881. Daniel Chester French, a master at personifying abstract concepts, kept a large workshop busy for decades; his important commissions included the Minnesota State Capital in Saint Paul and the U.S. Customs House in New York City. An important subset of architectural sculpture was ephemeral, constructed from a plaster and straw mixture known as staff and erected at world's fairs and other celebrations. At the WORLD'S COLUMBIAN EXPOSITION of 1893 in Chicago, millions saw the colossal *Republic* and *Barge of State* by French and Frederick MacMonnies, respectively, which decorated the central lagoon, while virtually every building in the fair was adorned with sculpture.

Civil War memorials and life-size bronzes depicting honored native sons were commissioned for countless public squares. While too many of these were formulaic, many incorporated an expressive naturalism. Among the best was John Q. A. Ward's *Henry Ward Beecher* (1891, Borough Hall Square, Brooklyn). Collaborative works with architects were common; monuments by architect STANFORD WHITE and sculptor AUGUSTUS SAINT-GAUDENS were among the style-setters. The pairing of French and Henry Bacon produced the *Lincoln Memorial* (1922, Washington, D.C.).

A smaller percentage of the era's sculpture was concerned less with memorializing and more with the exploration of form, surface, and psychological insight. Herbert Adams's polychromatic busts were derived from early Renaissance sculpture, while FREDERIC REMINGTON's bronzes celebrated the American cowboy. George Gray Barnard's *Struggle of the Two Natures in Man* (1894, Metropolitan Museum of Art, New York) owed a debt to the expressive innovations of Auguste Rodin. Occasionally, sculpture was controversial, especially the nude. In 1893 temperance and women's groups protested that MacMonnies's *Bacchante and Infant Faun* was licentious; in opposition, the Metropolitan Museum of Art gave it a home, and the Luxembourg Museum of Paris ordered a replica.

### settlement houses

Although it is usually said that settlement houses were first established in the United States in the late 1880s, their prototypes appeared much earlier. An early example is the Furman Street Mission, started in 1866 by young people in Brooklyn, New York. It became the Willow Place Chapel a decade later, and in 1906 a larger facility, Columbia House, was added to it. Throughout its 60 years of service, its purpose was to better the lives of immigrant children living in appalling poverty close to the Brooklyn waterfront. Similar at first to other SUNDAY SCHOOLS for immigrant children, started by churches after the Civil War, the school almost immediately added secular activities, such as those provided by celebrated settlements decades later. The first of these were a library, a day school (for sickly children who could not regularly attend public school), a sewing school for girls, an evening school for boys, and an annual picnic held in Prospect Park. Pratt Institute students interned at its KINDERGARTEN, which was added later and considered one of the best in the city.

Seemingly unaware of homegrown, settlement-like projects, founders of settlement houses in the United States took their model from Toynbee Hall, founded in East London in 1884 by Samuel Barnett, vicar of the “worst parish in London.” Part of Barnett's inspiration came from the teachings of John Ruskin, who held that industrialization and urbanization separated people—whether university educated or factory toilers—from meaningful work, culture, and beauty. Thus, poverty of spirit was as deadly as poverty of bread and shelter.

By 1891 there were six settlement houses in the United States: University Settlement on New York City's Lower East Side was reorganized by Charles B. Stover and Edward King after the Neighborhood Guild founded by Stanton Coit in 1886 collapsed. Jane Addams and Ellen Gates Starr began Hull-House on Halsted Street in Chicago in 1889. In 1887 Vida Scudder and two of her Smith College classmates founded the College Settlement Association, which in 1889 established College Settlements in New York City and Philadelphia and opened Denison

House in Boston in 1892. In 1893 Lillian Wald and Mary Brewster started a Visiting Nurse Service for Lower East Side tenement residents in New York, and two years later they moved into their own building, thereby creating the Henry Street Settlement. By 1900 there were more than 100 settlement houses, heavily concentrated in the large industrial cities of the Northeast and Midwest.

Settlement houses provided a meaningful occupation for idealistic college graduates, especially women, who were convinced that their minds, education, and talents could be put to good use addressing the social problems of urban slums. The pioneers and settlement workers in the 1890s were motivated by strong religious beliefs, which impelled them to serve but not to convert. Unlike in England, settlement houses in the United States took pains to avoid direct religious proselytizing and distanced themselves from charity organizations and their approach. Settlement houses were deeply committed to serving, befriending, and empowering their clients, most of whom were recent immigrants.

Settlement houses adjusted to the needs of the people they served. They shifted their emphasis from art, music, lectures, and general intellectual stimulation to providing instruction in English, skilled trades, and homemaking. Hull-House offered women and children child care, kindergarten, playgrounds, and instruction in sewing, a skill valuable for generating in-home supplemental income. As was the case with other settlements, Hull-House gradually became a center for political activism to improve HOUSING, public education, and other public services. Later, some settlements worked for electoral reform and engaged in labor organizing to improve working conditions and wages.

—J. Paul Mitchell

**Shaw, Anna Howard** (1847–1919) *women's rights activist, orator*

One of the most powerful orators of the woman suffrage movement, Anna Howard Shaw was born on February 14, 1847, in Newcastle-on-Tyne, England; at age four she moved with her family to Massachusetts. When she was 12 her father moved her, her mother, and her younger siblings to a homestead in Michigan while he returned East. As a result, Shaw carried more than her fair share of family responsibilities and became a teacher at the age of 15.

Eventually seeking more education, Shaw enrolled in high school at age 23 and entered Albion College at 26.

Anna Howard Shaw (Library of Congress)

In 1876 she enrolled in the divinity program at Boston University, graduated in 1878, and became the pastor of a Methodist Church in East Dennis, Massachusetts. When she applied for ordination, however, the New England Conference of the Methodist Episcopal Church refused to ordain a woman. She then applied to the Methodist Protestant Church and was ordained in 1880, becoming that denomination's first woman minister.

While she continued her pastoral work, she enrolled in medical school at Boston University. She also began to deliver speeches on temperance and woman suffrage. By the time she graduated from medical school in 1886, she had begun to believe that the best way she could serve women would be by pushing for the removal of the stigma of disfranchisement. In 1887 she began an independent career as a lecturer. She also became active in the WOMEN'S CHRISTIAN TEMPERANCE UNION (WCTU), and from 1888 to 1892 she was the superintendent of its national Franchise (or suffrage) Department.

Shaw's sermon before the International Council of Women in 1888 caught the attention of SUSAN B. ANTHONY. Shaw, who was already involved with the American Woman Suffrage Association (AWSA) became,

at Anthony's behest, involved in the National Woman Suffrage Association (NWSA) as well, and when the organizations merged in 1890 she became a national lecturer for the National American Woman Suffrage Association (NAWSA). When Anthony became the NAWSA president in 1892, Shaw became vice president.

Shaw wanted to follow Anthony as president of the NAWSA, but Anthony chose the more politically astute Carrie Chapman Catt as her successor. Shaw continued as vice president. When Catt resigned the presidency in 1904, Shaw became president. Her talents, however, did not fit the demands of the job. She was an ineffective administrator, she did not deal well with people who disagreed with her, and she had little talent for strategic thinking. So while the momentum for woman suffrage continued to grow, she was unable to give it direction. In 1915, after disaffected members persuaded Catt to challenge Shaw for the NAWSA presidency, Shaw announced that she would not seek reelection, but she remained on the board and continued to contribute her oratory to the cause.

After the United States entered World War I, Shaw chaired the Woman's Committee of the U.S. Council of National Defense. She had planned to return to lecturing for woman suffrage after the war, but she put it off when she was asked to join a speaking tour to rally support for the Treaty of Versailles and the League of Nations. She collapsed with pneumonia during that tour and died three days later on July 2, 1919.

### **Sherman, John** (1823–1900) *politician*

Born in Lancaster, Ohio, on May 10, 1823, able and effective politician John Sherman served Ohio in the U.S. Senate for most of the Gilded Age. Sherman practiced law in Mansfield after admission to the bar in 1844 and paid little attention to politics until the 1854 Kansas Nebraska Act threw open to slavery territories that had been free soil since the 1820 Missouri Compromise. Elected to CONGRESS as an anti-Nebraska man, Sherman in 1855 participated in the formation of the Ohio REPUBLICAN PARTY and served in the House from 1855 to 1861 and the Senate from 1861 to 1877. From 1877 to 1881 Sherman was secretary of the treasury in the RUTHERFORD B. HAYES administration and then in 1881 returned to the Senate, where he remained until 1897, when he became WILLIAM McKINLEY's secretary of state. He resigned in 1898 and died in Washington on October 22, 1900.

During his long career in Congress and the Treasury Department, Sherman was identified with public finance. He supported the protective tariff and opposed inflation, but he was not doctrinaire, adjusting to political pressure, and compromising in the interest of harmony. As befits a political leader from an industrial as well as agrarian state, he was a moderate, adept at balancing diverse interests. He supported the inflationary 1862 Legal Tender Act, which issued greenbacks, as an essential war measure, but in 1875 he was the main architect of the Resumption Act, which called for the return to the gold standard in 1879 by redeeming greenbacks in gold. While serving as treasury secretary under Hayes, Sherman secured enough gold to accomplish that feat. He participated in the CRIME OF '73 demonetizing silver, but with increasing demands for Free Silver, Sherman recognized that some limited silver coinage was politically necessary, and with the passage of the Sherman Silver Purchase Act of 1890, the government began to coin 4.5 million ounces monthly (see FREE SILVER MOVEMENT).

While Sherman thought that the government should encourage railroad and industrial development through subsidies and the protective tariff, he also favored government regulation, in moderation, of large-scale enterprises. He wanted to regulate interstate commerce but did not wish to determine railroad rates, and the 1890 SHERMAN ANTITRUST ACT prohibiting combinations in restraint of trade was sufficiently vague as to minimize its impact during the Gilded Age.

Sherman yearned to be president, but although he had solid support at the 1880 and 1888 Republican National Conventions he failed to get the nomination. His cold manner (he was known as "the Ohio Icicle") was no help, and despite ability and moderation, his identification with many issues gave voters too much to react against. In 1888 Hayes consoled Sherman with "the reflection that . . . the man of great and valuable service . . . must be content to leave the Presidency to the less conspicuous and deserving." Sherman remained in politics too long. As McKinley's secretary of state he did not favor IMPERIALISM, but he could do nothing to prevent either war with Spain or the acquisition of colonies overseas. Tired and ignored, he resigned.

### **Sherman Antitrust Act** (1890)

The last two decades of the 19th century were marked by widespread discontent among farmers, workers, and small

businessowners toward the monopolistic practices of the RAILROAD, OIL refining, lead, sugar, and MEATPACKING industries. Although a number of states had enacted anti-trust laws, state legislation had little or no impact on huge TRUSTS engaged in interstate commerce. Increasing demand for national regulatory legislation forced CONGRESS to act. In 1887 it passed the Interstate Commerce Act, creating a commission to regulate railroads, and in 1890 passed the Sherman Antitrust Act to regulate monopolies. These laws, designed to protect small business owners, farmers, and consumers, were largely ineffective in the Gilded Age.

Introduced by Senator JOHN SHERMAN, an Ohio Republican, the Sherman Antitrust Act declared that any "combination in the form of trusts or otherwise, or conspiracy, in restraint of trade or commerce among the several states, or with foreign nations" was illegal. Vagueness, however, weakened the Sherman Act. It did not clearly define what it exactly meant by a trust, a combination, or restraint of trade. Between 1890 and 1893, the government lost seven of eight cases involving the Sherman Antitrust Act that were brought before federal courts.

The most important case involving the Sherman Antitrust Act was *United States v. E. C. Knight Company* (1895). Since the Knight Company controlled virtually all sugar refining in the United States, the federal government argued it violated the Sherman Act.

The SUPREME COURT, however, in an 8 to 1 decision (JOHN MARSHALL HARLAN was the lone dissenter) ruled against the government's claim. The majority distinguished between commercial and manufacturing enterprises and declared that manufacturing was not commerce, did not restrain trade, and therefore did not fall under the jurisdiction of the Sherman Antitrust Act. The justices reasoned that manufacturing was essentially intrastate, even if the goods produced were sold across state lines. The *E. C. Knight* decision was not only a major setback to the anti-trust movement in the United States, but it also restricted the application of the Sherman Antitrust Act to such a degree that it virtually became a dead letter until Theodore Roosevelt resuscitated it a decade later.

**Simpson, Jerry** (1842–1905) *activist, orator*

The Populist orator Jerry Simpson was born on March 31, 1842, in Westmoreland County, New Brunswick, Canada. Between 1848 and 1852 he resided in several towns near the Great Lakes in both Canada and the United States. Except for a few years of home schooling, Simpson had almost no formal education. At age 14 he became a cook on a lake freighter and ultimately rose to the rank of ship captain. In 1861 Simpson enlisted in the Union army. However, he was mustered out after just three months because of poor health. Simpson married Jane Cape on October 12, 1870. They had two children.

In 1879 the Simpsons moved to Holton, Kansas, where he owned and operated a farm and sawmill. Taking advantage of high prices, Simpson sold out and invested his profits in a cattle ranch near Medicine Lodge in southwestern Kansas, but the severe winter of 1886 wiped out his herd and left him in debt. Having dabbled in politics, he was lucky to secure an appointment at \$40 a month as the marshall of Medicine Lodge. He also became involved in local politics. Originally a Republican, Simpson twice ran unsuccessfully for the state legislature as a Greenbacker (1886) and as a Union Labor Party candidate (1888). Between 1888 and 1889, Kansas plunged further into agricultural depression, and farmers throughout the state began to join the FARMERS' ALLIANCES in an effort to find a solution to their pressing economic problems. In 1890 the Farmers' Alliances joined with local reform elements in Kansas to create the PEOPLE'S PARTY (Populist Party). Simpson's attraction to reform-based politics made him an active member of the new party, which nominated him for a seat in the U. S. House of Representatives.

During the campaign, his opponents disparaged him as "Sockless Jerry," but Simpson shrewdly turned the intended insult to his advantage. He conveyed the Populist message in a folksy political style that endeared him to audiences. Not only was Simpson a tireless champion of political and economic reform, but he was also an advocate of the "single tax" plan popularized by HENRY GEORGE. Both Kansas Populists and Democrats endorsed Simpson, and he was elected to Congress in 1890, 1892, and 1896. As a leader of the fusion wing of the People's Party, Simpson supported the Populist nomination of WILLIAM JENNINGS BRYAN in 1896 and urged the Populists to support Democratic candidates whenever possible. His promotion of fusion (without which he could not have been elected) made many leading Populists resent him.

As a congressman, Simpson delivered few speeches and introduced few bills. Yet, he was well known for his sharp, shrewd wit and was a leader among House Populists. Simpson fought for currency inflation (he preferred greenbacks but accepted Free Silver [see FREE SILVER MOVEMENT]), disliked the autocratic rule of Speaker THOMAS B. REED, and opposed IMPERIALISM.

In 1898 Simpson lost his bid for reelection. He then moved to Wichita, where he began to publish *Jerry Simpson's Bayonet*. Following his failure to secure the Populist nomination for the Senate in 1900, Simpson retired from active political life. In 1902 he moved to Roswell, New Mexico, where he took up ranching and became a land-grant agent for the Santa Fe Railroad. He died on October 23, 1905, in Wichita.

## Sioux wars

The Sioux (Lakota) Indians fought three wars against the U.S. Army. From 1866 to 1868 the Sioux, led by RED CLOUD, opposed the building of the Bozeman Wagon Road and the army posts along it, since they encroached on Sioux hunting grounds. The Sioux resistance was successful, the army withdrew from its posts, and after protracted negotiations Red Cloud and some Sioux chiefs agreed to the 1868 Treaty of Fort Laramie, which created the Great Sioux Reservation in western South Dakota, including the Black Hills. Several bands, however, most notably the Oglala, Hunkpapa, and Miniconjou, would not relocate on a reservation no matter how large and refused to accept the treaty.

In the early 1870s nontreaty Sioux warriors mounted raids against white settlers who had moved into Montana, Wyoming, and Nebraska, but the second Sioux war broke out as a result of the BLACK HILLS GOLD RUSH. In 1874 miners accompanying an expedition led by General George A. Custer discovered gold in the Black Hills. The news spread quickly and thousands of whites poured into the Black Hills, trespassing on the Great Sioux Reservation, in search of the valuable metal. After the government tried unsuccessfully to purchase the Black Hills, which were sacred to the Sioux, federal officials in December 1875 ordered the uncooperative Sioux to relocate to reservations in six weeks (an impossibility in winter) or come under attack.

In March 1876 the army, previously hampered by severe winter weather, opened hostilities against the non-

treaty Sioux, who turned out to be most formidable. The Oglala were headed by renowned warrior CRAZY HORSE, and the Hunkpapa, led by SITTING BULL, defeated General George Crook on June 17, 1876, at the Battle of the Rosebud and annihilated Custer and his troops eight days later at the Battle of the Little Bighorn.

The army eventually prevailed in the spring of 1877, and Crazy Horse surrendered and apparently was prepared to live quietly on the reservation. General George Crook, however, believing rumors that Crazy Horse was planning to escape and lead another uprising, ordered his arrest, and the warrior was bayoneted in that process. Sitting Bull fled to Canada with approximately 2,000 Hunkpapa, Oglala, Miniconjou, Sans Arc, and Blackfoot Sioux; he returned to the Dakota Territory to surrender in 1881 after several difficult Canadian winters. After two years in prison Sitting Bull was relocated to the Standing Rock Agency on the border between North and South Dakota. There, he tried farming and actually toured one season with WILLIAM FREDERICK (Buffalo Bill) CODY's Wild West Show, but he did not particularly wish to assimilate and did not get along with the federal agent in charge of the reservation.

Sitting Bull became interested in the Ghost Dance religious movement that had started in the West around 1870 and was being revived on the Sioux reservations in 1889. Ghost Dancing, which involved communing with ancestors via a trancelike dance, unnerved the agents in charge, and in 1890 the army under General Nelson A. Miles moved in to monitor the situation. When Sitting Bull joined in the Ghost Dancing movement, the federal Indian agent in charge demanded that he be removed from the reservation. As Sitting Bull was being arrested, a fight ensued, and he was shot and killed.

After Sitting Bull's death, General Miles moved to stop what he saw as a potential uprising. On December 28, Miles confronted a group of Miniconjou Sioux at Wounded Knee Creek led by Chief Big Foot, whom he mistakenly thought were joining their Sioux brethren at the Pine Ridge Agency to revolt. As the military were disarming the Miniconjou, a gun discharged, which set off a fight. A total of 153 Miniconjou, including Chief Big Foot, were killed at Wounded Knee, and another 150 or 200 died later of wounds. In retaliation the Sioux ambushed the Seventh Cavalry on December 30, but Miles's Ninth Cavalry joined the Seventh in support. Outnumbered, the Sioux surrendered on January 15, 1891, which marked the end of the Indian Wars.

**Sitting Bull** (ca. 1831–1890) *leader in the war for the Black Hills*

Born in what is now South Dakota, Sitting Bull became a renowned Sioux warrior, Wichasha Wakan (holy man), and chief of the Hunkpapa Sioux tribe. His father, a Hunkpapa chief named Sitting Bull, first called him Jumping Badger, knowing that he would earn a more appropriate name at some point in his life. (Early on, he also was known as Hunkesni, or “Slow.”) He was reared by his father and uncles in the traditions of war and hunting buffalo and killed his first buffalo at age 10. When he became part of the Hunkpapa warrior society at 14, his father gave him his name and he became Sitting Bull. Sitting Bull was married for the first time in 1851 and became a Hunkpapa war chief in 1857. Following his father’s death in 1859, Sitting Bull’s standing within the tribe grew, and he soon became one of the leaders of the Hunkpapa band of the Teton branch of Sioux.

His first battles with U.S. forces occurred in 1863 when troops went after the Minnesota Sioux tribes and pushed into the Dakota Territory. Sitting Bull and his warriors fought against the army in the Battle of Killdeer Mountain on July

Sitting Bull (National Archives of Canada)

28, 1864, and continued to fight as the army built posts on the upper Missouri River. Sitting Bull did not sign the 1868 Treaty of Fort Laramie, which established the Great Sioux Reservation, and his standing among the nontreaty, resisting factions of the Sioux tribes (the hostiles) was such that in 1869 they designated him as their supreme war chief. In contrast, RED CLOUD, who had led the Sioux resistance, signed the treaty, accepted reservation life, and advocated peace. As a consequence, Red Cloud has been called the Sioux “statesman” and Sitting Bull the Sioux “patriot.”

The Great Sioux Reservation encompassed the land west of the Missouri River in the Dakota Territory and included the Black Hills. Prospectors suspected that the Black Hills region held gold, and in July 1874 an expedition under General George A. Custer (supposedly exploring the route for a road) happened to have prospectors along who found that there was indeed gold in those hills. The BLACK HILLS GOLD RUSH ensued, with thousands of miners pouring into that area and trespassing on Sioux lands. The federal government tried to purchase or lease the Black Hills, but the Sioux, buttressed by the nontreaty Sioux, refused. The U.S. government countered by ordering in December 1875 the nontreaty Sioux onto reservations in six weeks, which, even if they wished to comply, was in winter an impossibility. The army began the second of the SIOUX WARS in the spring of 1876. But in June 1876 Sitting Bull and the Oglala Sioux chief CRAZY HORSE defeated General George Crook at the Battle of the Rosebud and annihilated Custer, making his “last stand,” at the Battle of the Little Bighorn. Shocked and aroused, the army relentlessly pursued the warring Sioux until in 1877 Crazy Horse surrendered; Sitting Bull fled to Canada with about 2,000 followers. As the number of buffalo dwindled, so too did his followers, and Sitting Bull in 1881 returned to the Dakota Territory to surrender to the army.

Sitting Bull was imprisoned until May 1883, when he moved to a reservation where he even attempted farming, although he resisted assimilation. Between 1885 and 1886 Sitting Bull toured with WILLIAM FREDERICK (Buffalo Bill) CODY’s Wild West Show with sharpshooter Annie Oakley, a peculiar twist in American popular culture. In 1890 Sitting Bull, who was a holy man as well as a warrior, embraced the Ghost Dance RELIGION and was its leader on his reservation. Since the Ghost Dance religion had led to unrest on other reservations, authorities feared the worst and ordered Sitting Bull’s arrest. When Indian policemen attempted to arrest him on December 15, 1890, his followers resisted, and in the melee Sitting Bull was shot and killed.

## skyscrapers

The elevator and the STEEL frame were the necessary technological developments for construction of the first tall office buildings, which engineers, architects, and real estate developers pioneered in New York and Chicago in the 1880s and 1890s. The conditions motivating construction of the first skyscrapers were, however, economic in nature and derived from two key trends: the phenomenal increase in city populations after the Civil War due to IMMIGRATION from farms and foreign countries, and the industrialization and bureaucratization of work that concentrated more and more activities downtown. These developments increased the value of downtown land, which then stimulated an increase in the number of stories in individual buildings, tentatively in the first iron-frame structures and then decisively with the introduction of steel framing in 1888 in Chicago's Tacoma Building.

Tall office buildings then stimulated further increases in the value of the ground under these buildings, the office rents charged within them, and the number of floors necessary to ensure profits for the developers. This continuous spiral quickly increased the height of tall office buildings from the 10–15 stories of the earliest buildings to the 20 and 30 stories more readily associated with skyscrapers, a word first used in the early 1890s. New York skyscrapers tended to emphasize the theatrical possibilities of historical, largely neoclassical forms. The major architectural firms in Chicago tended to design skyscrapers that expressed the underlying steel frame.

No sooner had the steel frame been introduced than the first race to achieve supreme height occurred in Chicago. Between 1890 and 1891 the Masons and the Odd Fellows strove to acquire not just bragging rights for owning the tallest office building in the world but also the higher rents or the greater resale value that this added prestige would bring with it. The Odd Fellows failed to get their project off the ground, so Chicago's Masonic Temple—designed by Burnham and Root to be an innovative mixture of shops, offices, and Masonic parlors grouped around a 20-story atrium and topped by a roof garden complete with flower shows, tea service, and music recitals—became the first of the world's tall office buildings to be highly touted as such, as well as the source for the vaunting skyscraper rhetoric that surrounded similar rivalries in the 20th century.

No matter how high they rose, however, the primary concern in first-class office buildings was to provide amenable working environments. This imperative meant maximizing the amount of natural light in all offices during a period when electric light bulbs ran on low wattages. It also meant lining the corridors and vestibules of these buildings with the mosaics, marbles, plate glass, and glazed bricks that reflected or admitted the maximum amount of natural

Photograph of the Flat Iron Building, Manhattan, and the area surrounding the junction of Broadway and Fifth Avenue. The Flat Iron was completed in 1902 and was the first building in New York City with a steel frame. (*Library of Congress*)

light into the offices. Light-hued luxurious materials also validated or reinforced Victorian propriety in new work situations where men and a growing number of female clerks and secretaries mixed more freely with one another than they did elsewhere.

### Social Darwinism

Those who embraced Social Darwinism applied a convincing biological hypothesis to the workings of society. Charles Darwin's *On the Origin of Species*, published in England in 1859 and in the United States a year later, presented evidence that animals and plants evolve into new species through a process of natural selection that enabled those that best adjusted to the environment (the fittest) to survive. Americans were preoccupied with slavery, Civil War, and Reconstruction in the 1860s, but by the 1870s their main intellectual preoccupation had become EVOLUTION or, as it was frequently called, *Darwinism*. It quickly converted the scientific community, and secular-minded intellectuals—influenced especially by JOHN FISKE (for whom evolution confirmed his optimistic belief in progress)—soon followed suit. Christian churches, however, regarded Darwinism as an assault on RELIGION, since it denied that God created the world and all in it—including humans in his own image—in six days; substituted for the fall of man from innocence to sin the ascent of man; and suggested that all was accomplished not by God's orderly plan but by haphazard, accidental mutations. Yet, the Darwinian hypothesis was so compelling that theologians of mainstream Protestant denominations and subsequently ministers of fashionable urban churches like HENRY WARD BEECHER accepted evolution as God's plan and Darwinism as compatible with theism.

Darwin's ideas triumphed not merely because of his evidence but also because his notions of competition and progress resonated strongly with the outlook of Gilded Age business owners, politicians, and intellectuals. The term *Social Darwinism* gave their ideas the sanction of science. Herbert Spencer, the most outstanding Social Darwinist, was enormously popular in the United States. Beecher said he expected to meet Spencer in heaven as proof of the survival of the fittest, and ANDREW CARNEGIE understandably enough was his most prominent American disciple. Spencer argued that competition led to progress; that the fit (the rich and powerful) should be free to eliminate the unfit; and that government attempts to protect the unfit (the weak and poor) from the strong impeded progress, violated scientific law, and would in the long run fail. Spencer's laissez-faire ideas aimed to discourage any intervention on the part of government in the economy and also to paralyze the humanitarian reform spirit that would aid the weak.

WILLIAM GRAHAM SUMNER was Spencer's most consistent American disciple. A Yale sociologist, Sumner combined elements of the Protestant ethic—industry, frugality, temperance—with laissez-faire and Darwin's natural selec-

tion through competition. He regarded himself not as an apologist for wealthy businessmen but as a spokesman for the forgotten in the middle class who had to get by on their own wits. Sumner insisted that while laissez-faire should not protect the weak, it also meant no special governmental favors like the protective TARIFF for manufacturers. Sumner was a determinist who believed that the mores of a society evolved over time, uncontrolled by people and uninfluenced by government action, and he is renowned for his observation that you cannot legislate morality.

Social Darwinists not only saw a figurative jungle in the unbridled competition between and crass exploitation of individuals prevailing in Gilded Age America but also applied the concept of natural selection to nations and peoples. Although Americans had been convinced by historian George Bancroft that God had watched over the United States, John Fiske argued that America and Americans were the fittest nation and the most superior people in the world. In the hands of Fiske and other historians as well as clergymen like JOSIAH STRONG, Darwinism provided a scientific rationale for racist ideas and IMPERIALISM, while English and German scholars stressing Teutonic and Anglo-Saxon superiority did the same.

Darwinism (evolution), however, is a neutral concept and above all is not static. Competitive ideas arise that challenge and overthrow prevailing ideas, including those of the social Darwinists. LESTER FRANK WARD in *Dynamic Sociology* (1882) challenged the Social Darwinism of Spencer and Sumner with reform Darwinism. Ward's basic argument is that while the environment transforms animals, people transform the environment, and people can therefore control the evolutionary process. The Social Darwinists failed to appreciate the power of the human mind. Cutthroat competition and government inaction resulted from people's decisions, and if those practices harmed society, then people could through government regulate competition. Ward's ideas were not popular during the Gilded Age, but they were followed by reformers in the ensuing Progressive Era. Notions of racial and national superiority lost all intellectual underpinning in the 20th century with the rise of the Nazis in Germany and the post-World War II decline of imperialism.

### Social Gospel

A religious movement affecting mainstream Protestant denominations, the Social Gospel stressed the command-

ment of Jesus to love thy “neighbor” and confronted the deleterious effects on American society of industrialization and urbanization. Its American roots were in Puritanism, utopianism, and abolitionism, but its intellectual foundation was notably in the English Christian Socialism of Charles Kingsley and John Ruskin and the ideas of German theologians such as Albrecht Ritschl and Adolf von Harnack. The Social Gospel arose in the 1880s, became coherent in the 1890s, and was passé by 1918, the year in which its earliest voice, WASHINGTON GLADDEN, and its most eloquent voice, Walter Rauschenbusch, both died. And it paralleled, reflected, and reinforced the Progressive movement of which it was in many respects a religious manifestation. It was distinct from the urban ministries of the Young Mens Christian Association (YMCA) and the Salvation Army, which served the poor in the cities to save souls but not to end poverty or injustice. The Social Gospel in large part gave PROGRESSIVISM its strong religious overtones and its moral fervor.

The first phase of the Social Gospel was intellectual, marked by efforts to create a coherent vision of both the issues raised by industrialism and urbanization and the role of Protestant Christianity in addressing those issues. Gladden laid the groundwork by forging a liberal theology that addressed social needs. Other voices at this time were Francis Greenwood Peabody, Unitarian clergyman and Harvard Divinity School professor; economist RICHARD THEODORE ELY; and sociologist Albion W. Small. With others, they formed the conceptual apparatus that combined theology with the emerging disciplines of sociology and economics that would propel the next phase of the Social Gospel movement.

The second phase was dominated by JOSIAH STRONG, who organized the movement and was its most dynamic leader. He was renowned in his time (and notorious in ours) for his book *Our Country: Its Possible Future and Its Present Crisis* (1885). Modern readers are offended by his assumptions of Anglo-Saxon superiority and his paternalistic embrace of IMPERIALISM, but Strong's contemporaries regarded *Our Country* as a call for social reform at home and for Americans to promote peace, prosperity, and justice abroad through service, not political domination. *Our Country* was the most influential book to come out of the Social Gospel movement, but Strong's major contribution to the movement was organizing its disparate elements as general secretary of the Evangelical Alliance (1886–90), as leader of the American Institute for Social Service (1898–1916), and in 1908 helping create the Federal Council of Churches. These organizations backed legislation and programs to improve working conditions, combat social evils like drunkenness, eliminate political corruption, and improve the lives of the urban poor.

While both Gladden and Strong advocated state-regulated capitalism and were not socialists, Walter Rauschenbusch carried the social implications of Christianity further. This son of a German immigrant family began serving a Baptist congregation in New York's Hell's Kitchen in 1886. Struck by “an endless procession of men out of work, out of clothes, out of shoes, and out of hope,” Rauschenbusch was soon deep into the social ministry. Acquainted with HENRY GEORGE and JACOB A. RIIS, familiar with the writings of Karl Marx, EDWARD BELLAMY, and English Fabian Socialists, Rauschenbusch coalesced his ideas into his 1907 book *Christianity and the Social Crisis*, which defined the role of the church in a society that had the resources and the technology to provide all with a decent standard of living. Specifically, he advocated legislating public ownership of utilities and transportation, fair wages and better working conditions, and the redistribution of land to provide workers with decent housing. In 1917 he published *A Theology for the Social Gospel*, which provided a theological base for Progressive Christian beliefs just as progressivism was in decline.

## socialism

Socialists believe that a society based upon public ownership of property and its management for the common good (goods and services would be distributed according to need) is superior to one founded on private property and administered for individual profit. The concept of communal property is old and widespread; early Christians as well as NATIVE AMERICANS practiced it. But the modern socioeconomic-political doctrine denoted as socialism was a response to the major social changes wrought by industrialization.

Although writers such as Saint-Simon, Charles Fourier, Robert Owen, and Ferdinand Lassalle contributed to the theory, Karl Marx exerted the greatest influence over its development. Believing that economics was the dominant force in shaping history, Marx posited a class struggle between workers (the proletariat) and capitalists. The conflict would inevitably result in the establishment of socialism.

German immigrants carried socialist ideas with them to the United States prior to the Civil War, but it was not until the 1870s that the doctrine gained attention beyond ethnic communities. The activities of two flamboyant sisters, Tennessee Claflin and VICTORIA WOODHULL, however, created discord within the movement. The two worked as clairvoyants in the Midwest before moving to New York, where Claflin became a close friend of railroad tycoon CORNELIUS VANDERBILT. Vanderbilt made them stockbrokers and ensured their success with inside information. Despite this connection, the sisters joined Section 12 of the Marxist International Workingmen's Association (IWA), better known as the First International. They also published a newspaper, *Woodhull and Claflin's Weekly*, which advocated free love, abortion, and spiritualism as well as socialism. Fearful that the *Weekly* exposed socialism to ridicule, the European leaders expelled Section 12 in 1872. The expulsion caused a split, with "Americans" forming the American Confederation, which eventually lost its membership, and the German-Americans creating the North American Federation. Doctrinal disputes soon split the Germans into the Lassalleans, who favored political action, and the Marxists, who emphasized the organization of labor unions, and the IWA died in 1876. The two factions, however, came together in 1876 to form what became the SOCIALIST LABOR PARTY (SLP). The SLP suffered numerous schisms until 1892, when Daniel De Leon became its undisputed leader.

EDWARD BELLAMY's book *Looking Backward* (1888) provided the basis of an American version of socialism. Set in the year 2000, *Looking Backward* projected a socialistic society that voluntarily evolved. The lack of revolutionary conflict appealed to the many who joined Nationalist Clubs to promote the abolition of private property. But both the European and American forms of socialism had little impact.

It is ironic that Gilded Age America, rapidly industrializing and experiencing labor violence, did not embrace socialism. Several explanations for this apparent paradox have been advanced. One argues that the constant dissension and schisms within the socialist movement made it seem ridiculous. Another suggests that socialism was too closely identified with immigrants to be accepted by Americans. Still another notes that American labor unions, seeking immediate economic gains, rejected socialism. One further holds that the anticlericalism of most socialists alienated them from their ethnic communities, which tended to revere the church. Perhaps the best explanation is that the American promise of upward mobility, so attractive to immigrants, negated the appeal of socialism.

### Socialist Labor Party

The history of the Socialist Labor Party (SLP) is one of dissension and schism. Meeting in Pittsburgh in 1876, representatives of the two major divisions among socialists—the Lassalleans (who favored using the electoral process to capture the existing state) and the Marxists (who wanted to organize the working class for the revolutionary destruction of the state)—called for a "Unity Congress." Assembling in Philadelphia in July 1876, the Congress established the Workingmen's Party of the United States (WPUS). Although the delegates elected a Lassallean, Philip Van Patter, as national secretary of the WPUS, they demonstrated their Marxist leanings by prohibiting electoral politics except at the local level and then only when conditions appeared extremely favorable.

Convinced by the GREAT STRIKE OF 1877 that political action was expedient, the 1877 WPUS convention, boycotted by most militant Marxists, repealed the stricture against entering politics and changed its name to the Socialist Labor Party (SLP). The SLP supported the candidates of the GREENBACK-LABOR PARTY in the 1880 presidential election, but disenchanted by defeat, the 16 delegates attending the party's 1883 convention adopted the policy of using electoral politics only for propaganda purposes. Agitation for the eight-hour workday, however, encouraged the Lassallean leadership to reenter politics in 1886 by joining a number of local third parties. Although that effort was a disaster, the party ran its slate of presidential electors in New York during the 1888 election only to be badly defeated. The dismal returns reignited the internal debate over the role of electoral politics and ended in 1889 when the Lassalleans, known as the W. L. Rosenberg or Cincinnati group, bolted from the party to form the Social Democratic Federation.

The SLP's marxist tendency became more pronounced with the rise of Daniel De Leon to power, although he, like the Lassalleans, also wanted to participate in electoral politics. In 1892 De Leon, a Columbia University law professor, became the SLP's dominant voice as editor of its newspaper, *The People*, and the SLP regularly participated in presidential campaigns, receiving, for example, 36,000 votes in 1896. But the SLP directed most of its attention to capturing the labor union movement by "boring within," or placing its members in key union positions. This tactic resulted in the temporary replacement of SAMUEL GOMPERS as president of the AMERICAN FEDERATION OF LABOR (AFL) and the permanent removal of TERENCE V.

POWDERLY as grand master workman (president) of the KNIGHTS OF LABOR. But both organizations repulsed the SLP's bid for control. Angered, De Leon launched another SLP organization, the Socialist Trade and Labor Alliance. The creation of a dual (competing) union caused a group of trade unionists (called either the Kangaroos or the Rochester SLP) led by Morris Hillquit to leave the SLP in 1900. After a series of legal battles, the minuscule De Leon faction retained the name SLP, while the Kangaroos joined the SOCIALIST PARTY. In the early 20th century the SLP, led by the doctrinaire and divisive De Leon, had virtually no influence on the socialist movement and absolutely none on American society.

### Socialist Party

The Socialist Party was the product of Eugene Victor Debs's disillusionment following the PULLMAN STRIKE and schisms within the SOCIALIST LABOR PARTY (SLP). In 1897 Debs dissolved the American Railway Union and reconvened it as the Social Democracy of America. In addition to railroaders, two other distinctive groups joined the new organization. One, largely composed of recent immigrants, based their SOCIALISM upon the writings of Karl Marx and other European theorists. Victor Berger and his followers comprised the largest group in this wing. Emigrating from Austria, Berger settled in Milwaukee where he founded the Wisconsin *Vorwärts* and advocated political action to achieve immediate goals. Disciples of the Lassalleian W. L. Rosenberg, who left the SLP in 1889, and a New York faction recently expelled from the SLP completed the "European" wing of the party. The other wing, most of whom were born in America, consisted of former KNIGHTS OF LABOR, disgruntled agrarian radicals, and those who drew their inspiration from EDWARD BELLAMY's *Looking Backward* (1888), a novel describing a futuristic socialist society.

Reflecting its utopian basis, the Social Democracy committed itself to a colonization scheme. According to this plan members of the party would move into a western territory, where they would establish a socialist commonwealth. Once established, the commonwealth would fulfill Bellamy's prophesy and would be the example that the country would emulate and copy. Within a year Berger and others, however, convinced Debs that the colonization dream was unrealistic. Unable to convince the 1898 convention that it should remove the colonization plank from its platform, Debs, Berger, and others seceded from the Social Democracy to form the Social Democratic Party.

After electing two representatives to the Massachusetts legislature in 1898, the new party attracted more followers.

Another schism within the SLP in 1900 altered the Social Democratic Party's fortunes. Opposed to the SLP's creation of a dual (competing) union, the Socialist Trade and Labor Alliance—a group of SLP trade unionists led by Morris Hillquit—withdraw and conducted their own convention in Rochester, New York. After nominating a presidential ticket of Job Harriman and Max Hayes, the SLP dissidents and the Social Democratic Party discussed a merger, and although negotiations languished, the Social Democratic convention created a fusion ticket of Debs for president and Harriman for vice president. Both groups supported the fusion ticket, which received 97,000 votes, outpolling the SLP by a factor of three. Encouraged by the vote, both factions met in Indianapolis in 1900 and formed the Socialist Party of America, which at its high point in 1912 and with Debs at its head, attracted almost 1 million voters.

### sod houses

The scarcity of timber in the West meant that settlers could not easily or cheaply build a typical log cabin. The sod house, an austere dwelling built out of the earth itself, supplanted the log cabin in the West and became a symbol of the hardscrabble existence of the western settler. These settlers staked their claim on land, and then built homes made of the land.

The first sod houses appeared in Kansas during the 1850s. To make a sod house, a settler simply plowed the ground and used the furrowed sod to make bricks. The bricks, similar to the adobe clay bricks found in some Southwestern dwellings, were a yard long, 12 to 18 inches wide, and three inches thick. Roofs were crafted using layers of brush and grass and a final layer of sod, with the grass side down; a more expensive version used lumber or tar paper in place of the grass or brush. Some interiors featured plaster covering the sod walls, but windows and window frames proved to be a luxury, so sod houses usually had little light or ventilation. A one-room house used approximately a half-acre of sod.

Sod houses were either free standing or built into a hill. The dugout variety involved excavating the side of a hill or ravine and building a front wall out of sod bricks. Dugout homes lasted only a season or two and generally served as interim dwellings until a four-wall sod house could be built. A regular sod house was expected to last about six or seven

Sod schoolhouse (*National Archives*)

years. The structures looked like grass huts, as the organic sod bricks sprouted grass as well as insects and vermin. Although the sod protected homes against fire and made them easy to repair, leaking tended to be a problem, and its inhabitants constantly checked walls and ceilings that were in danger of caving in. Successful settler families eventually built traditional homes, although they continued to use “soddies” for livestock or outhouses.

### Solid South

The term *Solid South* refers to the political dominance of the DEMOCRATIC PARTY in the states of the former Confederacy. During the Reconstruction period, conservative, white-supremacy, Democratic governments gradually replaced the Radical Republican governments set up under the First Reconstruction Act (1867). Virginia and Tennessee were “redeemed,” as the Democrats put it, in 1869, North Carolina in 1870, Georgia in 1871, Texas in 1873, Alabama

and Arkansas in 1874, Mississippi in 1875 after a most violent election, and Florida, South Carolina, and Louisiana in 1877. The triumph of the Democratic Party in the South can be ascribed to a combination of amnesty that enfranchised former Confederates, intimidation of black voters who were invariably Republican, and racial politics that identified the REPUBLICAN PARTY with AFRICAN AMERICANS and thus united the white race in its opposition. The final withdrawal of federal troops supporting Republican governments in South Carolina and Louisiana in 1877 by President RUTHERFORD B. HAYES was foreordained by Democratic control of the House of Representatives and with it army appropriations, by the preoccupation of the North with the problems of a severe economic depression, and more fundamentally by the North’s apathy over the civil rights of blacks. After 1877 the former Confederate states sent practically solid Democratic congressional delegations to Washington and until 1928 consistently supported Democratic presidential candidates.

### Sooners

In the latter half of the 19th century, expansion rapidly filled the western territories. By the 1880s the states surrounding the Indian Territory (Oklahoma) were far more populous than the territory, which had less than two inhabitants per square mile. The federal government was under pressure to open the fertile triangle in the center of the Indian Territory that was not assigned to any tribe. “Boomers” from Kansas, Texas, and Arkansas desired that land, as did the RAILROADS. The most notorious Boomer, David L. Payne, anticipated that the government would eventually open the unassigned lands (“Old Oklahoma”) and surreptitiously surveyed land, going so far as to sell lots (without actually owning any of the land) in what is now modern-day Oklahoma City.

Bowing to pressure, CONGRESS authorized the opening of the unassigned lands to homesteaders in 1889. After the land was surveyed, as many as 20,000 people assembled at the borders of the district to claim land. At noon on April 22, 1889, homesteaders rushed forth on various modes of transportation to stake claims on land, and in one chaotic afternoon 1.9 million acres of land were claimed and Oklahoma City had a population of 10,000. The settlers acquired the land for free under the Homestead Act (1862), and the term *Sooners* refers to those who had sneaked past guards to get a head start on claiming the most desirable land. By the end of 1889 the Old Oklahoma District was home to more than 60,000 people. On September 16, 1893, a second major Boomer rush occurred in Oklahoma when the “Cherokee Outlet” was opened for settlement. Eventually, the chaos caused by the land rush led to the establishment of an application and lottery process.

The DAWES SEVERALTY ACT of 1887 made more Oklahoma land available for settlement. It provided for the redistribution of reservation land to members of Indian tribes and made land unclaimed by NATIVE AMERICANS available to white settlers at a cost of \$1.25 an acre, a modest price for the time. (The cost served to recoup money paid out by the government to Indian tribes.) In addition, in 1898 the Osage tribe and the Five Civilized tribes (the Cherokee, Choctaw, Chickasaw, Creek, and Seminole) were no longer exempt from the Dawes Act, and their sur-

plus lands ultimately were for sale. Oklahoma became a state in 1907.

**Sousa, John Philip** (1854–1932) *composer, conductor*

Famous throughout the world as a band director and composer of marches, John Philip Sousa was born on November 6, 1854, in Washington, D.C., to immigrant parents (his father was Portuguese and his mother was Bavarian). His musical ability was evident early, and as a child he studied violin at a local MUSIC school. Sousa’s father was a trombonist in the U.S. Marine Band, and when John Philip was 13, his father arranged to have him enlisted as an apprentice. He served in the Marine Band until 1875. During these years he also studied theory, harmony, and composition with George Felix Benkert, a Washington orchestral conductor and pianist. In 1876 he moved to Philadelphia, where he played first violin in Jacques Offenbach’s orchestra for the PHILADELPHIA CENTENNIAL EXPOSITION. He remained in Philadelphia for four years, working as a theater violinist, teaching, arranging, conducting, and composing. He found work as a director of musical theater, including a production of Gilbert and Sullivan’s *H.M.S. Pinafore* and a show titled *Our Flirtations* for which he composed, compiled, and arranged the score.

In 1880 Sousa was appointed conductor of the U.S. Marine Band. During the next 12 years, he developed the band into a first-rate musical ensemble. In 1889 he composed *The Washington Post March*, which brought him international fame, and by 1891 he was known as the March King.

In 1892 he resigned to form his own band, Sousa’s Band, which achieved an extraordinary level of excellence and worldwide fame. The Sousa Band was a band unlike any that had preceded it; its repertoire included, in addition to Sousa’s own marches, movements from popular operas and arrangements of popular music, including ragtime. Concerts by the band usually featured a performance by an attractive female vocal or instrumental soloist. Performances by virtuoso members of his band were also featured. Some of the most notable soloists were Arthur Pryor on trombone (Pryor also served as assistant conductor and arranger), Herbert L. Clarke on cornet, and E. A. Lefebvre on saxophone. The Sousa Band flourished for nearly four decades, touring North America annually except during World War I. During the war, Sousa served in the navy, organizing band units and directing a navy band of more than 300. The Sousa Band

made four European tours between 1900 and 1905 and a world tour in 1910–11. The band was finally dissolved in 1931 due to difficulties brought on by the Great Depression and Sousa's declining health. He died on March 6, 1932, in Reading, Pennsylvania, while preparing for a guest-conducting appearance.

Sousa's contributions to American music were many. From the time of his appointment to the Marine Band until after World War I, Sousa was the most prominent national musician. He composed and performed music for virtually every significant national event or celebration, from the WORLD'S COLUMBIAN EXPOSITION at Chicago in 1893 to the Liberty Loan Drive of 1917. Known throughout the world, Sousa is best remembered as a composer of marches. Among the best and most popular were *El Capitan* (1896), *Semper Fidelis* (1888), *The Stars and Stripes Forever!* (1896), and *United States Field Artillery* (1917). Some marches, such as *The Washington Post*, were popular for dancing in the United States and Europe. He developed a standard form for the march that has been widely adopted and imitated. A typical Sousa march has a brief introduction, strains A and B, both repeated, a brief interlude (called the "break"), and then a trio that is usually in a key a 4th above the opening tonic. The trio is most often repeated with a countermelody. Repeats of the trio are sometimes separated by brief dramatic episodes. The marches are in brisk 2/4 or 6/8 time. This form was borrowed and adapted by many ragtime composers.

Sousa's operettas were very successful and popular in their time. Between 1882 and 1915 he completed 12 operettas, of which the most successful were *El Capitan* (1895), *The Bride Elect* (1897), and *The Charlatan* (1898). Inspired by Gilbert and Sullivan, they pointed the way for the development of musical THEATER in the 20th century. Sousa contributed the sousaphone, a bass tuba that encircles the body with a widely flared bell, to the family of brass instruments. He had the first built to his specifications in the 1890s. Sousa objected to recorded music (he is credited with originating the term *canned music* in an article in *Appleton's Magazine*, September 1906). However, his band made many recordings, the earliest usually under the direction of Arthur Pryor. Sousa was also a prolific author. He published three novels, an autobiography, *Marching Along* (1928), numerous newspaper and magazine articles, and many other works. He was a shrewd businessman and a fighter for composers' rights. He was a founding member of the American Society of Composers, Authors, and Publishers (ASCAP) in 1914 and served as a director and vice president of the society from 1924 until his death in 1932.

### Spanish-American War (1898)

The four-month Spanish-American War, fought primarily on the island of CUBA, marked the arrival of the United States as a world power and brought an end to Spain's empire in the Americas. The immediate cause of the war was Spain's brutal, yet failing, strategy to quell a revolt in Cuba, which along with Puerto Rico, the Philippines, some Pacific islands, and a few African possessions was all that remained of the Spanish empire. The revolution began in Cuba in 1895, and Americans viewed it as a fight by a ragtag army of insurrectionists for freedom from a bloated and corrupt monarchy and equated the struggle with their own fight a century earlier against England. Egged on by Cuban exiles living in the United States, Americans began to smuggle weapons to the Cubans.

Americans also had strong commercial interests in Cuba. The widespread devastation caused by Spain's pacification strategy threatened American investments in Cuban railways and sugar plantations. In addition, with the frontier of continental North America effectively closed by the 1890s, expansionists preached the need for the United States to expand its economic power and export its surplus production into the Americas and the Pacific. Beyond Cuba's economic value was its strategic usefulness in defending an envisioned Central American isthmian canal that would permit the eastern American ports to exploit allegedly rich markets of the Orient.

In 1873 the United States had almost intervened in an earlier Cuban Revolution following the VIRGINIUS AFFAIR, but by 1898 IMPERIALISM—driven by economic ambitions, strategic concerns, and humanitarian impulses heightened by a sensationalist press—made war far more likely. In February 1898 the *New York Journal* published the DE LÔME LETTER in which the Spanish minister to the United States made disparaging remarks about President WILLIAM MCKINLEY. This insult was followed on February 15, 1898, by the explosion in Havana harbor that sank the American battleship *Maine* and killed 260 sailors and marines. The American press immediately blamed Spanish treachery and called for war, but a naval court of inquiry—while concluding that an underwater mine sank the *Maine*—could not determine responsibility. Although the Spanish government was the least likely culprit, it offered to have the questions of responsibility and reparations arbitrated and even agreed to an armistice (to last as long as the commanding general in Cuba thought prudent) in the war on the Cuban rebels. But the United States was in no mood for arbitration or for negotiations. McKinley, who had experienced the carnage of war, reluctantly gave in to pressure and on April 11, 1898, asked CONGRESS for the authority to use the armed forces to intervene in Cuba. Congress debated for a week before agreeing on April 19 by joint resolution, which McKinley signed the following day, and the war began.

Lithograph of the naval battle in Manila Bay, 1898 (*Library of Congress*)

A few days after the declaration of war, Commodore GEORGE DEWEY steamed with the American Asiatic Squadron to the Philippines to stop a decrepit Spanish fleet from voyaging halfway around the globe to reinforce Spanish naval forces at Cuba. Off Cavite in Manila Bay on the morning of May 1, the American fleet put the Spanish fleet of 10 ships out of action and forced its supporting shore batteries to surrender. While Dewey awaited troops, the Filipinos revolted for their independence and cooperated with the American army when it arrived to besiege Manila. American-Filipino relations deteriorated after Spanish authorities surrendered Manila on August 13, 1898, to American forces and the Filipino insurgents were frozen out. When it became apparent that the American goal was annexation of the Philippines and not independence, a bloody war called the FILIPINO INSURRECTION broke out.

The campaign for Cuba, plagued by logistic and transportation problems, got underway on June 22 with the landing of soldiers and marines at Daiquiri. Only after five days would all the troops be deployed and the beachhead be secured. The American strategy in Cuba was for the navy to blockade the island and cut off supplies for the Spanish while the army stormed the port of Santiago from the land.

The navy soon had the Spanish fleet trapped at Santiago Bay. The army meanwhile fought its way through dense jungle from the coast to the San Juan Heights overlooking the city. At the Battle of San Juan Hill, Theodore Roosevelt drove the Spanish from their trenches atop Kettle Hill with his ROUGH RIDERS by brazenly charging up the slope in the face of heavy fire. With Santiago certain to be captured, the Spanish fleet on July 3 risked destruction in an attempt to escape. Led by Admiral Pascual Cervera's flagship the *Infanta Maria Theresa*, the fleet steamed out the narrow mouth of the harbor to be destroyed by the American fleet. Faced with the probability of being shelled by land and sea, Governor General Ramón Blanco y Erenas surrendered his troops on July 17, 1898.

The peace treaty signed on December 10, 1898, gave the United States the Philippines, Puerto Rico, and Guam. Cuba became independent, since the Teller Amendment to the declaration of war specifically forbade its annexation by the United States. Cuba's independence, however, was nominal, since in 1901 it was forced to write into its constitution the Platt Amendment, which gave the United States the right to intervene in its affairs.

### sports and recreation

Several sports, including tennis, golf, and basketball, developed in the Gilded Age. Outdoor tennis, invented in Great Britain, came to the United States via Bermuda in 1874.

There, the vacationing Mary Outerbridge of Staten Island, New York, liked tennis so well that she embarked for home with net, rackets, and balls that, upon her landing, perplexed customhouse officers. In spring 1874 she designed the first American tennis court at the Staten Island Cricket and Baseball Club. Courts were built at Lakewood, New Jersey; Tuxedo Park, New York; and Newport, Rhode Island. By 1880 more than 30 eastern clubs had laid out tennis courts. The first important tennis tournament was held in 1880 on Staten Island.

The U.S. Lawn Tennis Association (USLTA), formed in 1881, sponsored a challenge-round tournament at Newport from 1881 to 1915. Richard Sears won the first seven USLTA tournaments. The sport was played mainly by wealthy easterners, and the early champions often came from Harvard University. Robert Wrenn, Frederick Hovey, and Malcolm Whitman won the singles championships from 1893 through 1900, while Holcombe Ward and Dwight Davis captured consecutive doubles titles from 1899 through 1901. Harvard students modernized tennis by using a twist overhand service, the passing shot, and the lob and by rushing to the net. Tennis gained popularity in 1900 when Davis donated a cup for annual competition among all nations, but in particular the Davis Cup stimulated competition between the United States and Great Britain. The Americans, led by Whitman, Davis, and Ward, upset the British, 5-0, in 1900.

Advertisement for a lawn-tennis equipment manufacturer, 1882 (Library of Congress)

Golf appeared in the United States by the 1880s. The leisurely sport appealed to wealthier, older people and was dominated by the British. Robert Lockhart purchased a set of golf clubs and two dozen guttie balls (rubberlike balls made from the gum of the gutta-percha tree) in Dunfermline, Scotland, in 1887 and brought them back to his Yonkers, New York, home. John Shotts, a Yonkers butcher, permitted golfers to hit balls around his 30-acre lot. In November 1888, Scotsman John Reid established St. Andrews, the first permanent American golf club. The six-hole St. Andrews course was built on Shotts's property and shifted locations several times over the next decade.

Scottish professional Willie Dunn in 1891 built Shinnecock Hills, the nation's first true golf course, at Southampton, New York. Dunn and 150 Indians from the Shinnecock Reservation cleared 4,000 acres of thick brush and laid out a 12-hole seaside golf links. After incorporating, Shinnecock Hills built a clubhouse and opened in 1892 with 70 club members.

In 1893 the Chicago Golf Club built the nation's first 18-hole course. Charles Macdonald, the club's best player, won the U.S. Golf Association's (USGA) first amateur championship in 1895 at the Newport Golf Club in Newport, Rhode Island. The USGA also sponsored the initial U.S. Open golf tournament in 1895. The Open was increased from 36 holes to 72 holes in 1898. Foreign-born golfers won every U.S. Open tournament from 1895 to 1910. American John McDermott prevailed with a winning 307 in 1911 at the Chicago Golf Club in Wheaton, Illinois. Golf grew rapidly from 50 clubs in 1895 to 1,040 by 1900.

In 1893 the Shinnecock Hills Golf Club designed a nine-hole course for women. Within two years, other courses for women were built at Morristown, New Jersey, and Yonkers, New York. Holland Ford, by 14 strokes, won the first women's tournament, held in October 1894 on the seven-hole Morristown course. In 1896 Beatrix Hoyt captured the first USGA-sanctioned amateur championship by two holes, with one hole left to play, at Morris County Golf Club in Convent, New Jersey. She won the next two USGA women's amateur titles by wider margins.

Basketball, the only major sport purely American in origin, was invented by Dr. James Naismith, who taught physical education at YMCA Training College in Springfield, Massachusetts (now Springfield College). Dr. Luther Gulick, physical education department head, asked Naismith to conduct an indoor activity for students. Naismith invented basketball, in which participants scored by shooting soccer balls into peach baskets suspended at each end of the school's gymnasium. In January 1892 Naismith wrote 13 basketball rules. Since his class had 18 students, Naismith assigned nine players to each side. Each team fielded three forwards, three centers, and three guards. Two centers tipped the ball at mid-court to start the game. Players

committing fouls were put in a penalty box until the next basket was made. To speed the game, Naismith removed the bottom from the peach basket. The game was called "Springfield ball" and "triangle ball" before student Frank Mahan named it basketball. Basketball initially was considered a YMCA exercise rather than a serious sport. Geneva, Yale, Pennsylvania, Wesleyan, Trinity, Chicago, Iowa, Stanford, Nebraska, and Kansas soon fielded men's varsity basketball teams, while Smith, Vassar, Wellesley, Newcomb, and Bryn Mawr had women's basketball teams. Columbia, Cornell, Harvard, Princeton, and Yale formed the Eastern Intercollegiate League in 1901.

## star route frauds

Special postal routes, designated on lists by three stars for "certainty, celerity, and security," were mostly in the West and depended on horses for transportation. Marauders, topography, and climate made them difficult and dangerous. In 1878 there were 9,225 star routes (some handling only three letters a week), for which \$5.9 million was appropriated. Between 1878 and 1880, Second Assistant Postmaster General Thomas J. Brady and his accomplices furnished sham petitions requesting that service be expedited on 93 of these routes. Improved service jumped annual operating costs from \$762,858 to \$2,723,464 and required a deficiency appropriation that aroused the suspicions of CONGRESS and President RUTHERFORD B. HAYES, but the Post Office Department claimed that increased service was needed and the money was appropriated. Hayes, however, insisted that no new star route liabilities be incurred without a review by himself.

In 1881, less than two months after Hayes left office, President JAMES ABRAM GARFIELD's postmaster general, Thomas L. James, exposed the star route frauds and revealed them as the source of some of the money that had financed Garfield's election. Stephen W. Dorsey, the secretary of the Republican National Committee, through his connection with Brady, was able to engineer Garfield's crucial victory in Indiana with star route money. Dorsey's brother, his brother-in-law, and a former partner controlled 24 contracts that had been worth \$55,246 but were increased to \$501,072. A small part of the increase went for additional service; the rest was put to private and political use. Dorsey later made the preposterous claim that he had spent \$400,000 in Indiana, but the Republicans were well funded in that state.

Garfield's assassination interrupted the investigation of the frauds, but the CHESTER ALAN ARTHUR administration persisted and eventually brought Brady and Dorsey to trial. After protracted litigation both were acquitted.

### Statue of Liberty

The Statue of Liberty symbolizes America as a haven for those seeking freedom from oppression and the opportunity to better their lives. It has been a beacon of hope to millions of immigrants, welcoming them to the United States. The French historian and statesman Edouard de Laboulaye was the first to come up with the idea for the Statue of Liberty. The statue was to commemorate the Franco-American alliance during the American Revolution as well as the idea of liberty embodied in America. The eminent French sculptor Auguste Bartholdi was entrusted with designing the monument. Bartholdi chose Bedloe's Island (now Liberty Island) in the Upper New York Bay as the site for the statue.

In 1875 fund-raising campaigns began in both France and the United States. The French were to raise money to pay for the statue, and the Americans would contribute to the cost of its pedestal. By 1881 the French campaign had managed to raise \$400,000. The American public, however, was not as enthusiastic. By 1885 the American Committee for the Statue, which was composed largely of members from the Union League Club, had raised only half of the \$100,000 needed for the pedestal. To supplement the funds already raised by the committee, JOSEPH PULITZER, the publisher of the *New York World*, took up the campaign and in less than five months raised the rest of the money.

Statue of Liberty, Bedloe's (later Liberty) Island, New York Harbor, 1890 (*Library of Congress*)

Bartholdi began construction on the statue in 1875. More than 300 sheets of copper (which appropriately, given the origin of many immigrants, came from Norway) were hammered into shape on wooden molds and then riveted together. Gustave Eiffel, to whom the design of the statue's internal steel and wrought iron framework was entrusted, began his work in 1879. The 151-foot Statue of Liberty was assembled and displayed in Paris before being shipped in parts to New York. Richard Morris Hunt, who was the first American to study at the École des Beaux-Arts in Paris, designed the 98-foot pedestal. Hunt had also designed the *New York Tribune* Building and the Lenox Library in New York City. The Statue of Liberty was officially presented to the United States in Paris on July 4, 1884, and was accepted on behalf of the American people by the U.S. minister to France, Levi P. Morton. The American dedication took place on October 28, 1886, with President GROVER CLEVELAND in attendance.

The Statue of Liberty soon became one of the most widely recognized landmarks in the entire world. It stood

as a symbol of the opportunity American offered for those in pursuit of freedom and new lives. In 1903, when EMMA LAZARUS's poem "The New Colossus" was inscribed on a bronze tablet and mounted on its pedestal, the Statue of Liberty became forever associated with the hopes and dreams of the millions of immigrants who have entered the United States.

## steel

Steel is an alloy of iron and carbon (up to 1.7 percent) that is malleable, light, and strong compared to cast iron, which has a higher carbon content. Steel had been made in small quantities for swords and armor for centuries and in slightly larger amounts in crucibles since the 18th century. The discovery of the BESSEMER PROCESS in 1856 meant that steel could be produced inexpensively by blowing cold air through molten iron in a pear-shaped converter. This British discovery marked the beginning of the second INDUSTRIAL REVOLUTION, which was born around 1870. In addition to Bessemer's contribution, an international collaboration between a German living in Britain and brothers in France had earlier developed the Siemens-Martin open-hearth method for making steel in 1858. It employed a shallow-bowled reverberatory furnace from which samples of the molten metal could be taken so that the refining could be stopped when the desired quality of the steel was obtained. The open-hearth furnace, however, was much slower than the Bessemer process, in which the proper carbon content was judged by the color of the converter's flame.

Bessemer steel was first made in the United States in 1864 and open-hearth steel in 1868. Because of the time lag between a discovery and its widespread application, the Civil War was fought with iron rather than steel, and large-scale inexpensive steel production was not realized until the 1870s. Initially, American manufacturers preferred the speed and guesswork of the Bessemer converter—especially in meeting the enormous demand for rails—but later when more alloys were added to steel, precision was required and the open-hearth furnace became more popular. The production of open-hearth steel did not overtake Bessemer steel until 1908. Overall steel production jumped from 68,750 long tons in 1870, to 1.2 million in 1880, 4.3

million in 1890, and to 10.2 million long tons in 1900. In 1880 open-hearth steel production was one-tenth that of Bessemer steel, in 1890 it was one-seventh, but by 1900 it was almost seven-tenths.

The technology of steelmaking was expensive and led to large-scale business organization. Smaller iron-producing companies were consolidated into large steel-producing corporations. Ironically, ANDREW CARNEGIE—colorful, controversial, contradictory, and the most successful steel producer—neither used the corporate form (Carnegie Steel was a limited partnership) nor depended on the protective TARIFF to build his empire of steel. Carnegie was an optimist who expanded during the depressions following the Panics of 1873 and 1893 (see BUSINESS CYCLES) when costs were low, picked talented men to be his partners, and was an excellent organizer. By 1900 Carnegie Steel—a vertical combination that owned iron and coal mines, transportation facilities, iron and steel plants, and fabricating mills—was producing between 25 and 30 percent of the nation's steel, and its profits were \$40 million, of which Carnegie's personal share was \$25 million. Carnegie's ambitions, however, transcended money-making, and in 1901 his company became the backbone of United States Steel ("Big Steel"), a \$1.4-billion corporation organized by J. P. MORGAN. It comprised 149 steel plants, 84 blast furnaces, 1,000 miles of railroad, and 112 Great Lakes vessels, in addition to vast coal, ore, and limestone deposits.

## Stone, Lucy (1818–1893) *women's right activist, abolitionist*

One of the major woman suffrage leaders of the 19th century, Lucy Stone was born on August 13, 1818, on a farm near West Brookfield, Massachusetts. At age 16 she became a teacher, and at 25 she entered Oberlin College. Stone graduated from Oberlin in 1847, becoming the first woman from Massachusetts to earn a bachelor's degree, and became a paid lecturer for the American Anti-Slavery Society. She soon began to talk about WOMEN'S RIGHTS in her antislavery lectures and was rebuked by the Anti-Slavery Society, but a compromise was reached: For a reduced salary, Stone lectured on antislavery on weekends and spoke on women's rights on weekdays at her own expense. Her audiences grew and occasionally numbered as many as 2,000 or 3,000 people. In 1850 Stone helped organize the first national women's rights convention in Worcester, Massachusetts, and she was a primary organizer of several national conventions thereafter.

In 1853 Henry Blackwell, a brother of ELIZABETH BLACKWELL, the first female doctor, began a determined courtship of Stone. She turned him down, but Blackwell persisted, eventually promising to “renounce all the privileges which the law confers on me.” They were married on May 1, 1855, and Stone became the first woman to keep her maiden name after her marriage. While Blackwell professed support for her women’s rights work, he frequently made it difficult for her to continue her work during the early years of their marriage. And after the birth of her daughter, Alice Stone Blackwell, on September 14, 1857, the organizational work that she had been doing fell to SUSAN B. ANTHONY.

At the conclusion of the Civil War, with her daughter in school, Stone returned full time to suffrage activity. She was involved, along with Anthony and Elizabeth Cady Stanton, in the formation of the American Equal Rights Association (AERA), a coalition dedicated to pushing for both African-American and woman suffrage. Both Stone and Anthony campaigned in Kansas in 1867 for proposals for black and woman suffrage. Both proposals were defeated, and the bitter Kansas campaign caused a rift between Stone and Anthony and Stanton. Midway through that campaign, the REPUBLICAN PARTY withdrew its support for woman suffrage. Stone returned East to raise money for the campaign, while Anthony remained in Kansas and accepted the help of George Francis Train, a Democrat and a blatant racist. Stone was convinced that Train was cynically professing support for woman suffrage in order to split the equal rights movement. She was also furious that her name was used in association with Train’s. Contributing to this “terrible time” for Stone was her husband’s affair with Abby Hutchinson Patton (soloist of the acclaimed Hutchinson family singers).

Like Anthony and Stanton, Stone was distressed by the inclusion of the word *male* in the Fourteenth Amendment and believed that the equal rights movement should push for an amendment giving the vote to both women and AFRICAN AMERICANS. Unlike Stanton and Anthony, who opposed the Fourteenth and Fifteenth Amendments, she refused to oppose voting rights for African-American men. “I will be thankful in my soul if *any* body can get out of the terrible pit,” she said.

In 1869 Anthony and Stanton broke off from the AERA to form the National Woman Suffrage Association (NWSA). Later that same year Stone formed the American Woman Suffrage Association (AWSA) and was aided in its organization by her now contrite husband, Henry. Stone in 1870, abetted by Henry, also started and was the mainstay of a weekly newspaper, the *Woman’s Journal*. After 1882 their daughter Alice assumed major editorial responsibility, and it appeared until 1931. Called the “voice of the woman’s movement,” it, by reporting on all

aspects of the suffrage struggle, made a major contribution to ultimate victory.

While the NWSA had a reputation for being more nationally oriented, the AWSA frequently supplied more signatures to petitions for a national suffrage amendment than the NWSA, and both organizations were heavily involved in local suffrage campaigns. The real reason for two organizations was that Stone did not trust Anthony and Stanton, who she feared might discredit the entire movement. Stone, who was more socially conservative, cringed when the NWSA allowed itself to become associated with VICTORIA WOODHULL (and through her to be associated in the public mind with free love). Nor was she happy when Stanton spoke in favor of relaxed divorce laws. By the 1880s, however, Stone recognized that a merger of the AWSA and NWSA would benefit the movement. The merger took place in 1890. Anthony managed to get Stanton elected president of the merged organization, while Stone became the chair of its executive committee. Her dying words on October 18, 1893, admonished her daughter Alice to “make the world better.”

**Strong, Josiah** (1847–1916) *minister, social reformer*  
The most prominent advocate of the SOCIAL GOSPEL, Josiah Strong was born in Napierville, Illinois, on January 19, 1847, but grew up in Hudson, Ohio. A graduate of Western Reserve College (1869), Strong continued his studies at Lane Theological Seminary, Cincinnati, was ordained a Congregational minister in 1871, and for two years was a home missionary in Cheyenne, Wyoming. He returned to Ohio in 1873 and served as an instructor at Lane, a pastor at Sandusky, secretary of the Ohio Home Mission Society (1881–84), and then for two years as pastor of the Central Congregational Church of Cincinnati. His experience in Cincinnati and especially with the Home Mission Society focused Strong’s attention on the challenges to Protestantism by the rapid, unsettling industrialization and urbanization of America.

His response in 1885 was to publish his and the Social Gospel’s most important 19th century work, *Our Country: Its Possible Future and Its Present Crisis*. Combining Puri-

Josiah Strong (New-York Historical Society)

tan morality and Manifest Destiny, Strong tried to arouse and inspire Protestants to evangelize and reform America and to utilize its enormous resources to reshape the world for the better. Although Strong is remembered as a racist and imperialist, he wanted the aggressive Anglo-Saxons to spread their superior institutions throughout the world and by so doing promote peace, prosperity, and justice. His ideas were missionary, not military, and he was as opposed to exploiting weak people abroad as he was at home. His contemporaries realized *Our Country* was an attempt to mobilize Protestant America to combat social evils, economic distress, and political corruption and to create an ideal society on earth through reform legislation.

Although Strong was a prolific writer, his main contribution to the Social Gospel was as an organizer. From 1886 to 1898 he was the general secretary of the Evangelical Alliance, calling for ecumenical action on social issues and sponsoring the Interdenominational Congress that met in 1887, 1889, and finally in 1893, at the WORLD'S COLUMBIAN EXPOSITION at Chicago. This last meeting had an immense impact. Strong emphasized a pragmatic religion that linked "fact and faith," tying surveys and statistics to scripture. By 1898 this stance had led to a more daring

position than the alliance affirmed, so Strong left the alliance and organized the League for Social Service. Under his leadership until his death in 1916, the league attacked urban and social problems like poverty and drunkenness and tried to improve working conditions with a "safety first" campaign. In 1908 Strong, in keeping with his ecumenical approach, helped form the Federal Council of Churches in Christ in America, the precursor of the National Council of Churches.

Ironically, Strong is remembered for celebrating the "Anglo-Saxon race" and for encouraging IMPERIALISM, but he was motivated by a paternalistic love (not by fear and hatred and a desire to exploit) that wished to achieve social justice at home and abroad and "bring the Kingdom of God on Earth."

#### **Sullivan, Louis H.** (1856–1924) *architect*

With their evident structuralism and ornament derived from nature, Louis H. Sullivan's buildings inspired the phrase "form follows function" and presaged modern architecture. The son of a dancing master, Sullivan was born in Boston, Massachusetts, on September 3, 1856. He received architectural and engineering training at the Massachusetts Institute of Technology and the École des Beaux-Arts in Paris. He then worked briefly in the Philadelphia office of Frank Furness and the Chicago office of William Jenny. In 1881 he entered the office of Dankmar Adler, an established architect with important ties to the Jewish community of Chicago as it rebuilt itself after the fire of 1871. The partnership of Adler and Sullivan was established in 1883 and continued until 1895, marking Sullivan's most productive period as a practicing architect. Although Adler has been credited solely with engineering and managerial skills, historians now acknowledge his innovations in exploiting the structural elements of architecture. On his own after 1895, Sullivan won few major commissions but became more active as a writer and theorist. He died on April 14, 1924, in relative obscurity and poverty. His influence was long felt, however, through his writings and through the "Chicago school," a style promulgated by younger architects such as Frank Lloyd Wright and George Grant Elmslie, both of whom worked in Sullivan's office.

Sullivan's ideas were expressed in a passionate blend of poetry, philosophy, sociology, and architectural criticism. He believed that the historical eclecticism of his era was

mindless and that the outward form of modern architecture must derive from inward function. However, he also knew that architecture must be more than mere functionalism; it must also express intellectual, emotional, and spiritual realities. Sullivan's highly distinctive style of ornament derived from his understanding of the rhythms of degeneration and regeneration in living organisms, which provided the model for all architectural development. During his lifetime, Sullivan's ideas were presented mainly to professional audiences. In 1918 his *Kindergarten Chats* first appeared in book form, and in 1924 his *Autobiography of an Idea* was published. Both works remain in print and influential.

Sullivan is probably best remembered for his commercial buildings. His Transportation Building at the WORLD'S COLUMBIAN EXPOSITION of 1893 in Chicago was essentially a polychromatic shed with an enormous ornamented arched entrance, called the "Golden Door." The idiosyncratic building became an aberrant attraction at the fair, which was a bastion of classicist design. In the trading room of the Chicago Stock Exchange (1894), now reconstructed at the Chicago Art Institute, Sullivan's lyrical organic ornament was executed in stenciling, terra-cotta, metal, and stained glass. Sullivan's work in skyscrapers culminated in the Guaranty Building (1896, Buffalo, New York), where the steel skeleton was encased in a thin envelope of brick and structural units were emphasized with terra-cotta ornament. The steel-frame construction of the Schlesinger and Mayer Company Store (now Carson Pirie Scott) in Chicago (1899, 1904) was likewise made evident, and street-level windows were exuberantly framed with Sullivan's ornament in metal. A series of bank buildings in small Midwestern towns closed Sullivan's career, giving him a chance to create functional forms exquisitely ornamented.

**Sumner, William Graham** (1840–1910) *political and social scientist*

William Graham Sumner, America's most influential promoter of SOCIAL DARWINISM, was born on October 30, 1840, in Paterson, New Jersey, and grew up in Hartford, Connecticut. He studied theology at Yale from 1859 to 1863 and abroad between 1863 and 1866. After returning to the United States he was a tutor at Yale from 1866 to 1869. Ordained a Protestant Episcopal priest in 1869, he entered the ministry and served briefly in New York City and as rector from 1870 to 1872 at Morristown, New Jer-

sey. In 1872 Sumner was appointed professor of political and social science at Yale, where he taught until his retirement in 1909. In that year he was elected president of the American Sociological Association, and he died the following year on April 12, 1910.

Sumner's ideas about society emerged from a confluence of Protestant religious beliefs. There were classical laissez-faire economic principles, which advocated a hands-off government policy that would promote a free competitive economy and ensure the greatest prosperity for the largest number, and Charles Darwin's theory of biological EVOLUTION. Sumner lived in an era when intellectuals, no longer certain that God created humans in his image, struggled to reconcile their belief in God with the modern evolutionary thinking of geologists and biologists. The evolutionary hypothesis contradicted the biblical account of creation as well as the transcendental notion that God was benevolent and one with nature.

In trying to reconcile traditional Christianity, 19th-century SCIENCE, and the industrial revolution, Sumner achieved great popularity. His efforts to synthesize these elements in a science of society were influenced by the English thinker Herbert Spencer, who applied Darwin's evolutionary theory to society. Possessing the moral fervor of a Puritan preacher, Sumner equated the Protestant ethic of industry, frugality, and temperance with the strengths that enabled the "fittest" individuals not merely to survive but to achieve success. He embraced the ideas that people are unequal, that they have no natural rights, that competition is as much a law of nature as gravity, and that the progress of civilization depends on unrestricted competition.

Accordingly, in Sumner's view, people need total freedom from state intervention in the economy, whether it be tariffs to enrich industrialists, inheritance taxes to level society, safety laws to protect labor, and even antimonopoly legislation to preserve competition. Since government interference hampered competition and led to the survival of the unfit, Sumner believed that the state should limit itself to defending "the property of men and the honor of women . . . against crime." If people were free from the misguided and hindering effects of the state, competition would yield the best possible results for society. For nearly four decades Sumner lectured and wrote for prestigious journals, advocating his views that competition was glorious, success was the reward of virtue, and that if some were rich and powerful and others were poor and weak, this social reality was the evolutionary, and the only, path toward social progress.

Sumner, however, was progressive in his belief that the state should invest in public EDUCATION. Universal education could not promise students equality, but it could give individuals the chance to show their merit. He served as a member of the Connecticut State Board of Education from

1882 to 1910, where he had an opportunity to carry out his beliefs. But apart from education, Sumner consistently adhered to his Social Darwinian ideas.

Sumner was not the tool of big business, despite its usual appreciation of his laissez-faire ideas. Although he thought “millionaires are a product of natural selection,” he also feared they corrupted government with their lobbies. Sumner did not believe that government policies capable of serving private interests should be awarded to the highest bidder. He opposed protective tariffs and overseas imperialistic expansion. Just as he did not oppose corporations, he did not oppose labor unions and believed that their bargaining power would more effectively improve working conditions than government regulations. Sumner argued that he spoke for the “forgotten” middle class that paid taxes to enrich the plutocracy and support the idle. Although few individuals could agree totally with Sumner, conservatives found much, and progressives almost no, support in his Social Darwinism.

## Supreme Court

During the Gilded Age the Supreme Court, reflecting the growth of large-scale industrial enterprises, became the bastion of property rights, the champion of laissez-faire, and the enemy of state regulation of commerce. Prior to the Civil War the Court interpreted the commerce and contract clauses of the Constitution to allow states considerable regulatory latitude, and in the 1870s it continued that practice. For example, in the *Slaughterhouse Cases* (1873), the Court upheld the right of Louisiana to grant a monopoly in order to regulate butchering, and in *Munn v. Illinois* (1877)—one of the Granger cases—the Court approved state regulation of interstate RAILROADS. But by the 1880s economic and political changes had affected the personnel of the Court and changed its attitude.

The dominant Supreme Court jurist during the Gilded Age was neither Chief Justice Morrison R. Waite (1874–88) nor Chief Justice Melville W. Fuller (1888–1910) but rather Associate Justice STEPHEN J. FIELD, who served on the Court from 1863 to 1897. Field dissented in the slaughterhouse cases, arguing that the monopoly awarded by the

state violated the Fourteenth Amendment by depriving persons of property the due process of law, and he similarly dissented in *Munn* on grounds that state regulation of railroads threatened private property. Field reiterated that argument until, by the late 1880s, it was accepted by the Court. In *Wabash v. Illinois* (1886) the Court adopted Field's view that states could not regulate interstate commerce. The Court, which continued to reflect Field's influence as late as the 1930s, defended private property from the federal government and narrowly defined its regulatory power. Accordingly, the Court in *Pollock v. Farmers' Loan and Trust Co.* (1895) declared the federal income tax, a direct tax, unconstitutional and emasculated the SHERMAN ANTITRUST ACT of 1890 in *United States v. E. C. Knight* (1895) by holding that the sugar trust's monopoly of refining (manufacturing) did not constitute restraint of trade. In 1897 the Court stripped the Interstate Commerce Commission (established in 1887 to regulate railroads as a result of the *Wabash* decision) of its power to regulate rates and to eliminate the long-haul/short-haul abuse.

While Field dominated the Gilded Age Supreme Court, its voice of the future belonged to Associate Justice JOHN MARSHALL HARLAN, who served on the Court from 1877 to 1911 and was its great dissenter. He did not think the court should base its decisions on so-called natural laws like laissez-faire nor should it abuse its power of judicial review. He disagreed with the majority in both the *Pollock* and *Knight* cases. Most notably, while the Court in the Gilded Age became the ardent defender of property rights—ironically, using the civil rights Fourteenth Amendment to do so—it, with the conspicuous exception of Harlan, neglected human rights. He forcefully dissented in the *CIVIL RIGHTS CASES* (1883), when the majority held that equal rights in public accommodations were not covered by the Fourteenth Amendment, and most notably when the Court, in *PLESSY V. FERGUSON* (1896), agreed that “separate but equal accommodations” did not violate the Fourteenth Amendment. “Our Constitution,” Harlan declared, “is color-blind and neither knows nor tolerates classes among citizens.”

**Tanner, Benjamin Tucker** (1835–1923) *author, minister*

Benjamin Tucker Tanner, an African Methodist Episcopal (AME) bishop, was born in December 1835 in Pittsburgh, Pennsylvania, one of 12 children of Hugh and Isabella Tanner. He celebrated his birthday on December 22 or 23 until about 1860, when he claimed December 25 as his date of birth. Tanner began working at least by age nine, when he delivered copies of Martin Delany's newspaper, *The Mystery*. He left home in his early youth to work as a barber, first in Chicago and then in Cincinnati and other Ohio River ports. Tanner's diary, which he started in 1851, shows an interest in politics, especially in the issues of slavery, and revealed his dismay when he wrote in 1851 that he did not wish to die in the United States. Returning to Pittsburgh, Tanner studied from 1852 to 1857 at Avery College; joined the African Methodist Episcopal (AME) Church in 1856; studied at the Western Theological Seminary from 1857 to 1860; was ordained an AME minister; and in 1860 was chosen to go to California as a missionary. Unable to raise sufficient funds, Tanner was permitted by Bishop Daniel A. Payne to assume the pastorate of the 15th Street Presbyterian Church in Washington, D.C. Subsequent assignments led him to pastor AME Churches in Frederick and Baltimore, Maryland. Tanner was proficient in Latin, Hebrew, and Greek, but he feared that he lacked the spiritual commitment to preach. His diary entry for February 10, 1866, stated, "I pray for a faith that I can believe without a doubt and recommend without an indifferent spirit. Such a faith I have not. O God give it to me lest I die."

Indeed, Tanner is more renowned as an author and editor than as a preacher. His book *An Apology for African Methodism* (1867) led to his appointment as editor of *The Christian Recorder* in 1868. This position provided him an opportunity for 16 years to indulge his passion for scholar-

ship. Tanner became in 1884 the first editor of *The AME Church Review*, a journal that was the culmination of years of anticipation on the part of the church's intellectuals. Tanner used the editor's position of both journals to comment on AME missions, development of clergy, race relations, American and international politics, and other issues of interest to AFRICAN-AMERICAN readers.

Tanner was critical of racial segregation. He stated in 1872 that "we want schools for Americans . . . not for Chinese . . . Negro . . . German . . . Irish nor English Americans but simply Americans." Tanner was equally critical of black nationalists who sought separation or who identified themselves as "Negro." It was his contention that "Negro" was reserved for Africans and not for "Colored" Americans (his preference), who were a racial mixture. He wrote in 1881, "we are not African. Certainly to designate us as Negroes is a fraud. We are Americans [and] the sooner we recognize it the better." His desire for an integrated society led him to declare in 1884 that American geography would lead to a distinctive American race that would combine European, African, and American Indian blood to form a race that would be seven-eighths white, one-eighth African, "with a mottle of yellow."

Tanner was a conservative theologian whose opposition to female preachers conflicted with the more liberal views of HENRY M. TURNER, Bishop John M. Brown, and Theophilus G. Steward. Tanner argued that God, Jesus, and the disciples did not sanction female preachers. He was extremely critical of Steward's theology that embraced the Darwinian theory of evolution as God's plan of creation. Tanner castigated Steward for asserting that the Battle of Armageddon in biblical prophesy would end Anglo-Saxon superiority rather than the world and would result in the rise of true Christianity from Africa and Asia with equality for all races. Tanner contended that Armageddon would lead not to a transfer of power but to the second coming of Christ and the resurrection. Tanner, however, did argue that Africans were major contributors to the origin of Judaism

and Christianity. After Tanner was elected to a bishopric in 1888, he wrote little on secular matters and concentrated on advice for ministers and building the church as it sought to open mission fields in Canada, the Caribbean, and Africa. During this period he was at odds with Henry M. Turner, who advocated not only a more aggressive African mission endeavor but emigration to Africa.

Tanner was a prolific writer. In addition to his *Apolo-**gy* he wrote *The Negro's Origin or Is He Cursed of God?*<sup>9</sup> (1869), *The Color of Solomon—What?*<sup>9</sup> (1895), *The Descent of the Negro* (1898), *The Dispensation in the History of the Church and the Interregnums* (1898), and *The Negro in Holy Writ* (1900). Tanner married Sarah Elizabeth Miller on August 19, 1858. Their union produced nine children, seven of whom survived infancy. Carlton was an AME clergyman and writer, Halle became the first woman licensed to practice medicine in Alabama, and Henry became an internationally famous painter whose art is displayed in the world's museums and art galleries.

### tariff issue

A tariff is a tax on imports, and it has been used by the United States to raise money to pay for the costs of government, to protect domestic goods from foreign competition, and to force foreign nations to change their trade policies. Throughout the history of the United States, the tariff has been a major, often passionate, political issue.

With the triumph of the REPUBLICAN PARTY in 1860, protectionism also triumphed. During and after the Civil War CONGRESS raised rates from roughly 20 percent to a high of 47 percent in 1869. Both major parties, the Republicans explicitly and the Democrats tacitly, accepted protectionism, although not without a measure of dissent within each. The tariff issue became, from time to time, a source of bitter contention between Congress and the president. Occasionally, a president would advocate tariff reform, only to be thwarted in his designs by an uncooperative Congress. It, for example, reluctantly enabled President CHESTER A. ARTHUR to appoint a tariff commission in 1882 that recommended substantial reductions. Congress, however, in 1883 allowed only a 5 percent reduction and retained protectionism. President GROVER CLEVELAND, in December 1887, devoted his entire annual message to the tariff, asking Congress to

reduce its rates. The Democratic majority in the House of Representatives approved a tariff reduction bill, but the Republican-controlled Senate rejected the bill. The deadlock made tariff reform a major issue in the ensuing 1888 presidential election. It was close. Cleveland won a plurality of the popular vote, but the Republican candidate BENJAMIN HARRISON, a protectionist, carried the electoral college and with it the presidency.

The Republicans remained focused on the tariff, which they believed won them not only the presidential election but several congressional seats as well. For the first time since 1875, the Republicans controlled the presidency and both Houses of Congress. Under the strong-willed leadership of Speaker THOMAS B. REED of Maine in the House and the protectionist Nelson W. Aldrich of Rhode Island in the Senate, the Republican majority earned the name the “billion dollar Congress” because of the various spending programs it approved. It also passed a new tariff that took the name of one of its sponsors, Representative WILLIAM MCKINLEY of Ohio.

The McKinley Tariff passed in October 1890. Drafted by Aldrich and McKinley, it increased already high rates by another 4 percent and at that time was the highest protective tariff the nation had ever adopted. The McKinley Tariff, however, also included a reciprocity provision designed to encourage foreign trade and discourage foreign retaliation against the high American tariff rates. The president was authorized to remove items from the “free list” if their countries of origin placed unreasonable tariffs on American products. The McKinley Tariff proved to be politically vulnerable. Protectionists had always been careful to stress that American labor benefitted from protection, but attacks on the McKinley Tariff convinced Americans that it was far more friendly to big business than to consumers in general or labor in particular.

Republicans misinterpreted public sentiment on the tariff issue and suffered a major political reversal in the 1890 congressional elections. Their majority in the Senate was reduced to eight seats; in the House, Republicans retained only 88 of 323 seats, with William McKinley among the defeated. The Republican Party also suffered in the presidential election of 1892, which saw Grover Cleveland come back and defeat the incumbent president Harrison. In 1894, President Cleveland again supported a House measure reducing tariff rates, but Senate Republicans, aided by southern Democrats concerned with protecting NEW SOUTH industries in their region, gutted the bill and restored most of the rates. Although Cleveland denounced the restructured tariff bill, he allowed it to become law without his signature as the Wilson-Gorman Tariff. The law also included a small federal income tax provision of 2 percent on all incomes over \$4,000, but that was eventually declared unconstitutional by the SUPREME COURT.

The economic depression following the panic of 1893 enabled the Republicans, led by McKinley, to triumph in 1896. Fully committed to raising tariff rates, the Republicans in 1897 passed the Dingley Tariff, expanding reciprocity and raising rates to an average of 57 percent, the highest level in American history.

**Tesla, Nikola** (1856–1943) *inventor*

Nikola Tesla was born on July 9, 1856, in Smiljan, Croatia (then part of the Austro-Hungarian Empire), to Serbian parents. His father, an Orthodox clergyman, intended him for the church, but Tesla—uninterested in religion and fascinated by mechanics, physics, and mathematics—ultimately secured parental approval to study engineering (1875–79) at a polytechnic college in Graz, Austria. Tesla also loved literature, especially poetry, and read widely in several languages. To develop these interests, he began studying at Charles University in Prague in 1879, but his father's death cut short his schooling, and Tesla—whose understanding of electricity and its uses was outstanding—was employed by the telegraph office of Hungary, then by the telephone company in Budapest, and in 1882 by the Continental Edison Company in Paris.

While in Budapest, Tesla conceived the basic idea—a rotating electromagnetic field—that made possible an alternating-current (AC) electric motor. Arousing no interest in his idea, Tesla left for America in 1884 with a letter of introduction to THOMAS ALVA EDISON. Edison was not interested in AC but gave Tesla a job designing better direct-current (DC) motors. Tesla resigned in 1885 following a dispute over his compensation and, with the help of some backers, formed a company to develop arc lamps for

street lighting, but when the lamps were in production he was eased out.

Experiencing poverty, Tesla dug ditches for a while, but in 1887 he formed the Tesla Electric Company with the support of executives of the Western Union Telegraph Company and set up a laboratory to explore and perfect his ideas for an AC electric motor. From 1887 to 1891 Tesla patented those and other ideas and in 1888 sold the patents for an AC motor to George Westinghouse. This invention had an enormous effect on the growth of cities, since it provided the motive power for electric street railways, elevated rail lines, and subways.

Tesla's interests went beyond AC motors. He continued working on arc lamps to reduce their annoying hum and found it disappeared if higher frequencies were used, which led to the development of the Tesla coil transformer. In 1893 Tesla's AC polyphase system illuminated the WORLD'S COLUMBIAN EXPOSITION at Chicago. Apart from the AC motor, perhaps Tesla's greatest achievement was the completion in 1896 of the world's first hydroelectric generating plant at Niagara Falls. It was the forerunner of large-scale generating plants and electrical networks. Since

Nikola Tesla (Library of Congress)

AC at a high frequency is the most efficient way to transmit power, Tesla's work on transformers and his development of the "Litz" wire with its many strands were crucial for the development of the electrical industry. Tesla also experimented with wireless radiotelegraphy and in 1898 patented a radio-controlled ship.

Living alone in a New York City hotel room, Tesla was an eccentric who came to prefer the company of pigeons to people. His capacity to visualize mentally what others could not see without a diagram led him to be impatient and offensive with colleagues and left him with few friends. He was independent (he worked as briefly for Westinghouse as he did for Edison), but he was a poor businessman who would not hire a manager and, despite industries built on his genius, spent the last four decades of his life in poverty. Feeling cheated, he became secretive about his ideas, and since his ideas required huge investments, they were not explored. Ignored in America, he was a national hero in Yugoslavia and lived largely off a \$7,200 annual gift from its government. He died in his room at the New Yorker Hotel on January 7, 1943.

## theater

The Gilded Age was a time of transition for the musical theater and drama in the United States. At the beginning of the period, English and Continental influences dominated theater in America; by the turn of the century, the American theater had its own stars, playwrights, and tastes, though a new set of foreign influences was emerging. The period also witnessed important changes in stagecraft and business practices.

Musical entertainments were common during the 19th century, but it was not until *The Black Crook* (1866) that the basic elements of musical theater came together in the United States. The show combined MUSIC, dance, and spectacle to tell a melodramatic story. Moralists denounced the show because the dancers (a French ballet troupe stranded in America) showed too much leg, but *The Black Crook* enjoyed unprecedented success during its original run in New York City. Touring companies and revivals sustained the show until the late 19th century. *The Black Crook* inspired burlesques, spin-offs, and parodies (*The Black Crook Burlesque*, *The Black Crook Song Book*, and *The White Crook*) and prepared American audiences for such popular musicals as *Evangeline* (1874) and a British import, *Florodora* (1900).

Generally, the musical theater in America hardly differed from its counterparts in England and Europe. Comic operas by French composer Jacques Offenbach were popular during the 1870s and 1880s, while English comic operas by Gilbert and Sullivan dominated the American musical stage after 1879. Operettas, another European import, came into fashion during the 1890s, though an American composer, VICTOR HERBERT, made his mark in the genre with *Prince Ananias* (1894), *The Wizard of the Nile* (1895), and *The Serenade* (1897). Of course, burlesque, minstrelsy, variety, and vaudeville also offered musical entertainment.

Drama, like the musical theater, took its cues from abroad. During these years when there was no "American" drama of consequence, the vitality of theater in America depended largely on the appeal of star actors—Edwin Forrest, JOSEPH JEFFERSON III, John Drew, Minnie Maddern Fiske, Edwin Booth, and such foreign attractions as Sir Henry Irving and Sarah Bernhardt. Shakespeare and melodrama were their stock in trade and were the dramatic staples of the period.

During most of the 19th century Shakespeare was not high culture in America but popular ENTERTAINMENT. Shakespeare was performed at a wide range of venues across the country, even in rough-and-tumble mining camps. Some immigrant neighborhoods got their Shakespeare in Yiddish, German, or other foreign language productions. Variety theaters often presented works by Shakespeare on the same bill with magicians, jugglers, acrobats, comedians, and song-and-dance acts. Minstrel and burlesque shows frequently included Shakespeare parodies.

Of course, the appeal of Shakespeare rested largely on the merits of the works themselves, but in America theaters promoted the bard as a moral playwright. This strategy was meant to counter VICTORIANISM and the latent suspicion that theatrical entertainments were somehow immoral. Theater historians with a practical turn of mind note that Shakespeare was in vogue because Shakespeare was in the repertoire of most companies. Touring stars, if they did not have their own traveling companies, could mount a short-term production using the actors, sets, and costumes of local stock companies.

By the 1890s, however, Shakespeare was less popular. The mass audience in America, which had grown increasingly exuberant and aggressive, turned to vaudeville, burlesque, and movies, leaving Shakespeare to more refined theatergoers. Class distinctions became a feature of the American theatrical experience. More discrete and high-minded audiences increasingly favored legitimate drama performed in legitimate theaters, where the price of admission was too high for rowdy workingmen and their families.

Even at such venues, melodrama soon surpassed Shakespeare. Melodrama combined suspense, high emo-

Poster for a popular vaudeville show (Library of Congress)

tion, sensationalism, and elaborate plot contrivances in a moralistic framework. In the world of melodrama, virtue always emerged triumphant. Female chastity was usually at the heart of the drama. Women in melodrama generally personified gentleness, selfless love, innocence, and moral virtue, in essence, the Victorian ideal. Naturally, the villain, who embodied worldliness, corruption, and lust (the bane of Victorianism), set out to despoil the heroine, body and soul. Only the hero, the epitome of manly virtue (though typically somewhat dense), could rescue the heroine from “a fate worse than death.” Melodramas upheld Victorian notions of gender and domesticity. The home (woman’s sphere) was a sanctuary, “a haven in a heartless world.” The genre also drew moral distinctions between the city (a dangerous den of vice and temptation) and the country (a peaceful, innocent place of simple, virtuous, hardworking people).

Prior to the 1850s American melodrama was an inferior product. American theaters relied on translations or adaptations of English or European melodramas. But the stage version of Harriet Beecher Stowe’s famous novel,

*Uncle Tom’s Cabin*, changed all that. It caused an immediate sensation in 1856 and remained a homegrown staple of the American theater well into the 20th century. During the 1890s approximately 400 companies toured the country with their versions of the popular melodrama. With *Uncle Tom’s Cabin*, American melodrama came of age. The genre enabled American playwrights to dramatize a wide range of social ills, such as drunkenness, urban crime, political corruption, and the exploitation of workers.

A key figure in the maturation of the American theater was Dion Boucicault, a playwright and manager who had enjoyed considerable success in England before establishing himself in New York City. He specialized in expensively mounted melodramas, though his best-known work was an adaptation of *Rip Van Winkle* that renowned actor Joseph Jefferson performed for 40 years. After Boucicault, David Belasco, William Gillette, and Augustus Thomas further refined the melodrama by introducing more scenic realism, reducing violence, and minimizing improbable plot twists. Their reforms coincided with the emergence of the “well-made play,” a British innovation featuring less improbable plots, well-crafted dialogue, a more restrained acting style, and realistic production values. Playwright Clyde Fitch was the foremost American practitioner of the genre.

The latter years of the 19th century saw other substantial changes in the American theater, some of them originating abroad. Controversial works by Ibsen and Shaw had their first American productions during these years, thus inaugurating modern theater on this side of the Atlantic. American realism found expression in plays by WILLIAM DEAN HOWELLS and Edward (Ned) Harrigan. At the level of stagecraft and production values, the hallmarks of the period were new techniques (improved lighting, versatile stage designs) and greater use of opulence and spectacle. Consolidation was the principal development in the business of theater, culminating in a theatrical trust organized in 1896. The syndicate enabled producer Charles Frohman, booking agents Mark Klaw and Abraham Erlanger, and a few regional partners to dominate commercial theater in the United States into the early 20th century.

**Thomas, M. Carey** (1857–1935) *educator*

Martha Carey Thomas, college president, was born on January 2, 1857, in Baltimore into a wealthy, educated, Quaker family. She graduated from Cornell in 1877 and then studied Greek privately at Johns Hopkins but, as a woman, was barred from its seminars. Beginning in 1879 Thomas studied philology for three years at the University of Leipzig, and since no German university would grant the doctor of philosophy to a woman, she transferred to the Swiss University of Zurich and received her Ph.D. *summa cum laude* in 1882. Academic frustrations coupled with the influence of her mother and her aunt made Thomas a passionate feminist. In part, she pursued the Ph.D. to prove that women could excel in difficult subjects and had the same right to study SCIENCE and culture as men.

With a college for women at Bryn Mawr in the planning stage, Thomas saw an opportunity to further her career and hammer home her conviction that rigorous intellectual pursuits should be open to her sex. Capitalizing on the good fortune that her father and two uncles were trustees of the new college, Thomas—fresh from her triumph at Zurich—audaciously asked to be made its first president. The trustees chose a male but made Thomas its dean and professor of English. In 1894, by the margin of one vote, they named Thomas president, and she served until 1922. As dean and as president, Thomas insisted that the standards at Bryn Mawr be as high as at the leading colleges for men. She required difficult entrance examinations and modeled the curriculum on that of Johns Hopkins, with students taking relevant parallel courses in a prescribed sequence as well as demonstrating to her satisfaction their proficiency in foreign languages. She had no use for either practical courses or for the elective system and retained the traditional faith that the virtue of mental discipline could be achieved by studying languages (preferably dead) and mathematics. As an administrator Thomas was opinionated, vigorous, impetuous, at times devious, and always the autocrat who detested the idea of faculty self-government. Yet, although Bryn Mawr under her idiosyncratic leadership bucked dominant trends in higher EDUCATION toward coeducation and a flexible and practical curriculum, Thomas made it into an outstanding institution.

With roots in Maryland dating back to the 17th century, Thomas had strong aristocratic leanings. Although she worked tirelessly for equal rights and woman suffrage amendments to the Constitution, her egalitarianism ended there. At Bryn Mawr she aimed to train an elite, with the conspicuous exception, inspired by the spirit of noblesse oblige, of a summer school she inaugurated in 1921 to expose working women to social issues and cultural ideas. She believed the white race, especially Nordics, intellectually superior to people of color, favored IMMIGRATION RESTRICTION, hampered the promotion of Jewish instruc-

tors, and—stressing heredity over environment—kept statistics on the ancestry of incoming freshmen. An acrimonious depiction of Thomas can be found in Gertrude Stein's novel *Fernhurst*.

Thomas thought women, even if they married, should pursue active careers. She never married but had long-term love affairs with two childhood friends, Mary (Mamie) Gwinn and Mary E. Garrett, the Baltimore & Ohio Railroad heiress. Garrett willed Thomas a fortune, which she utilized for wide travel in a grand style. Just prior to her death on December 2, 1935, Thomas returned to a changed Bryn Mawr College for its 50th anniversary, but her high standards and the inspiration of her pioneering spirit had endured.

**Tiffany, Louis Comfort** (1848–1933) *designer, painter*

Noted chiefly for his stained glass, Louis Comfort Tiffany was born in New York City on February 18, 1848. He was the son of the founder of Tiffany and Company and had early exposure to fine decorative arts and the methods used to produce them. Instead of entering the family firm, however, Tiffany chose a career as an artist. By the age of 18 he had exhibited at New York City's prestigious National Academy of Design, and he continued to paint in oils and watercolors throughout his life. By 1879 Tiffany had turned to interior design, then a nascent profession. With painter Samuel Colman, textile designer Candace Wheeler, and furniture designer Lockwood de Forest, Tiffany formed Associated Artists, which quickly found success contriving interiors full of intricate patterns and sumptuous color. The firm was dissolved amicably in 1883, and Tiffany formed his own company to decorate interiors, focusing especially on glass architectural fittings such as mosaics, light fixtures, and windows. While conducting innovative experiments in glass, Tiffany oversaw a large corps of craftspeople designing theaters, clubs, and residences. In the early 1890s he began designing blown-glass vessels, which he soon marketed under the name "Favrile Glass." By 1900 he had established Tiffany Studios, which manufactured lamps, ceramics, enamels, and more.

Tiffany was a masterful businessman and promoter. Any of his services or products could be purchased at his Manhattan showroom, and many were also available through his father's company, where he became artistic director in 1902. He organized prominent displays at the WORLD'S COLUMBIAN EXPOSITION of 1893 in Chicago and at subsequent world's fairs; donated his works to museums

in America; and sold his products at Siegfried Bing's taste-making shop, L'Art Nouveau, in Paris. He spent much time designing Laurelton Hall, his own home in Cold Spring Harbor, New York, and after 1918 managed the Tiffany Foundation, which offered young artists working retreats. Tiffany Studios declared bankruptcy in 1932, a year before Tiffany died (January 17, 1933, in New York City), and his glass fell out of fashion until the 1960s, when it became highly collectable.

All of Tiffany's work was marked by a sensuous approach to color and light. By introducing variegated colors and textures into individual pieces of glass, Tiffany (along with his rival John La Farge) transformed the art of stained glass. Unlike medieval and baroque craftsmen who painted upon glass, Tiffany's motifs were formed by the play of light through glass that had been mottled, textured, and otherwise colored to produce calculated effects. While he derived motifs from many sources, especially Islamic and Roman glass, nature was his richest source of inspiration. Wisteria, peonies, and dragonflies were favorite motifs for lamp shades, while ecclesiastical windows depicting landscapes, rather than conventional biblical figures, generated controversy. Tiffany was perhaps happiest when he could create a fully integrated interior. He did so for Henry and Louisine Havemeyer, whose New York City house (now demolished) featured a ceiling of Japanese textiles, a fireplace of iridescent tiles, and a suspended staircase of wrought iron. Tiffany's name is now so well known and so identified with richly colored stained glass, the term *Tiffany* is used to describe any stained-glass lampshade.

—Karen Zukowski

**Tilden, Samuel Jones** (1814–1886) *politician, lawyer* Samuel Jones Tilden, reformer and presidential candidate, was born on February 9, 1814, in New Lebanon, New York, the son of Elam Tilden and Polly Younglove Jones. He attended Yale for one term (1834) and the University of the City of New York (now New York University), where he also studied law. In 1841 he was admitted to the bar and practiced in New York City. A bachelor, Tilden devoted his life to politics and the law. He became a masterful and wealthy railroad attorney and a brilliant political organizer.

Tilden was an active member of the DEMOCRATIC PARTY in New York. As a student, he wrote political articles for New York newspapers in support of Martin Van

Buren. In 1843 Tilden was named corporation counsel of New York City, served one term in the New York Assembly (1846), and was identified with Van Buren's antislavery "Barnburner" faction in New York. Tilden was also a delegate to the 1856 Democratic National Convention and the 1860 convention of Douglas Democrats.

During the Civil War Tilden joined other Northern Democrats in supporting a war to restore the Union as it had been and opposed the emancipation of slaves and the growing power of the federal government. During Reconstruction, Tilden favored the policies of President Andrew Johnson. In 1866 he was named chairman of the New York State Democratic Committee, and in 1868 he managed the unsuccessful presidential campaign of Horatio Seymour.

Tilden won a national reputation for attacking the spectacularly corrupt TWEED RING, but he was a tardy political reformer. In the late 1860s William M. Tweed, the "boss" of TAMMANY HALL—New York City's Democratic Party organization—and his associates dominated politics in the city and the state. Tilden, however, did not attack Tweed until after the *New York Times* in 1871 published damning evidence of the Ring's stealings. Tilden's reluctance to attack Tweed stemmed from both his cautious nature and his Democratic partisanship.

In 1874 Tilden's reform reputation gave him the Democratic nomination for governor of New York, and he defeated the incumbent John A. Dix by a plurality of 50,000 votes. As governor, Tilden added to his reform reputation by leading a successful attack against the corrupt "canal ring," which was a bipartisan group of politicians and contractors who made fortunes on the repair and extension of the state's canal system.

Tilden's activities as governor of a pivotal state made him the Democratic presidential nominee in 1876. In the November election he had approximately 250,000 more popular votes than his Republican opponent RUTHERFORD B. HAYES and won 184 electoral votes, which was one short of a majority. Hayes had 163 votes, but 22 electoral votes in Florida, Louisiana, Oregon, and South Carolina were contested. In the ensuing crisis neither Tilden nor Hayes provided much leadership for the contending forces in CONGRESS. Presidential candidates at that time were supposed to be above politics, but the stance especially suited the cautious, passive nature of Tilden and was galling to many of his followers. To resolve the disputed election, Congress created the Electoral Commission of 1877. Ultimately, the commission (which had a Republican majority) declared Hayes the winner by one electoral vote.

Following the disputed election, Tilden remained a significant figure in national politics. However, he suffered various physical ailments that eventually forced him to withdraw from public life. Tilden died on August 4, 1886, and left the bulk of his estate in trust for the establishment

of a free library in New York City. His bequest served as the foundation of the New York Public Library.

### **Tillman, Benjamin Ryan** (1847–1918) *politician*

Governor and senator, reformer and racist, Benjamin R. Tillman was born on August 11, 1847, on his parents' large farm in upland Edgefield County, South Carolina. His family was unusually violent in a violent section in a violent time. In feuds, quarrels, and duels, his father and a brother each killed a man, and two brothers were killed. Having lost his father to typhoid fever when two years old, Tillman helped his mother run an inn in their home and manage their farm, with its 86 slaves. He loved books and attended a local academy until 1864, when he left to enlist in the Confederate army but never entered it because a tumor cost him his left eye and incapacitated him for two years. While recovering in Georgia, he met Sallie Starke, a fellow South Carolinian, whom he married on January 8, 1868. They had seven children.

Tillman became a successful farmer and a political force. Starting with 430 acres given him by his mother, he diversified his crops and acquired more land, having more than 1,000 acres by the early 1880s. Tillman was violently opposed to Radical Republican Reconstruction, based on universal black male suffrage. He supported the Edgefield Plan to organize secret illegal military units to use violence to keep the African-American majority from voting. From 1873 to 1876 Tillman belonged to the Sweetwater Saber Club, which assaulted black voters and assassinated black political leaders. During the 1876 presidential campaign he participated in the Hamburg and Ellenton riots to elect the Democratic candidate SAMUEL JONES TILDEN. Violence did not prevent the election of the Republican RUTHERFORD B. HAYES, but it did elect Democrat Wade Hampton as governor and “redeem” South Carolina.

Tillman and his Edgefield neighbors soon discovered that redemption exchanged Republican carpetbaggers for Hampton's lowland planter aristocracy that was conciliatory toward AFRICAN AMERICANS and ignored the interests of upland farmers. An ugly man with a rasping voice, irascible and disliked by his neighbors, Tillman was an unlikely

political leader. He became one because he and his neighbors suffered agricultural reverses, and at the 1885 meeting of the State Grange and State Agricultural and Mechanical Society, he called for a system of state agricultural education and blamed the plight of farmers on the Charleston merchants and lawyers who dominated the state government. As a result of follow-up letters to the Charleston *News and Courier*, he organized the Farmers' Association in 1886. That organization helped Tillman secure the South Carolina governorship in 1890.

Serving as governor until 1894 and as U.S. senator from 1895 to 1918, Tillman introduced reforms, ensured white supremacy, and secured his power in South Carolina. He replaced officials, similar to Hampton, with partisans and established a primary system for nominating Democratic candidates. He redrew election districts to cut the representation of blacks, and he completely eliminated African-American holders of local offices by making them appointive by the governor. Under his leadership the 1895 South Carolina constitution eliminated black voters with a poll tax, property and educational requirements, and tests of individual voters. Tillman's reforms included reorganizing the University of South Carolina, establishing Clemson College as the state's agricultural and mechanical college and Winthrop College as a normal and industrial school for women, increasing state appropriations for education, empowering the state railroad commission to fix rates, limiting the hours of labor in cotton mills, equalizing taxes, and establishing a public monopoly for the sale of alcoholic beverages.

Having promised in 1894, when campaigning for the Senate, to “stick his pitchfork” into GROVER CLEVELAND's ribs, Tillman achieved national notoriety as an extreme advocate of southern agrarianism. “Pitchfork Ben” even had hopes of securing the 1896 Democratic nomination for president, but his violent denunciation of Cleveland turned off the convention, which nominated WILLIAM JENNINGS BRYAN. In the Senate Tillman opposed Republican policies, including IMPERIALISM. He hated Theodore Roosevelt but helped him secure effective railroad regulation by steering through the Senate the administration's Hepburn Act (1906). Tillman remained a southern extremist on race, justifying LYNCHING, in the case of rape, and force to disfranchise African Americans, and advocating the repeal of the Fifteenth Amendment. Tillman died in Washington, D.C., on July 3, 1918.

**Further reading:** Stephen David Kantrowitz, *Ben Tillman and the Reconstruction of White Supremacy* (Chapel Hill: University of North Carolina Press, 2000); Francis Butler Simkins, *Pitchfork Ben Tillman: South Carolinian* (Baton Rouge: Louisiana State University Press, 1944).

## track and field

American interest in track and field began at Princeton University in 1869, when Princeton students participated in track contests called the Caledonian Games. An athletic association at Columbia University also held its first track-and-field meet in 1869. Columbia, Yale, Princeton, and Cornell soon formed track clubs.

In the early 1870s track meets were held at regattas. During the 1873 regatta-sponsored track meet at Hampden Park in Springfield, Massachusetts, James Gordon Bennett, Jr., owner of the *New York Herald*, offered a \$500 prize for the winner of a two-mile race. Duncan Bowie of McGill University won the race in 11 minutes, 18.5 seconds. The second regatta-sponsored track meet was held in 1874 at Saratoga, New York. About 30 students from eight colleges participated in the 100-yard dash, one- and three-mile runs, 120-yard hurdles, and seven-mile walk. The 1875 regatta-sponsored track meet at Saratoga included 10 track-and-field events. Amherst, Cornell, Harvard, Union, Williams, and Yale boasted winners.

Trackmen soon took direct control of their annual meet from the regatta committee. Presidents of the Harvard and Yale Athletic Associations invited 10 colleges in December 1875 to form the Intercollegiate Association of Amateur Athletes of America (IC4A). Management was given to a committee of students directly involved in track and field. The first annual IC4A meet was held in 1876 at Saratoga (the day after the regatta) with six running and nine field events. The IC4A prohibited foreigners from competing and awarded prizes to winners. Seventy-one athletes competed in the track and field events. Princeton captured the first IC4A title with four individual champions, including J. M. Mann in the baseball throw and 16-pound shot.

The IC4A remained the dominant college track-and-field event and was moved in 1877 to New York City. From 1880 through 1896, Harvard or Yale won every IC4A meet. American collegians set several track records after Charles Sherrill introduced the sprinter's crouch-start in the late 1880s. Georgetown's Bernie Wefers clocked 9.8 seconds in the 100-yard dash and 22.6 seconds in the 220-yard dash. The Amateur Athletic Union began holding annual track-and-field championships in 1888 and allowed noncollegiate amateurs to compete.

Americans made no concerted effort to send a strong track-and-field team to the first modern Olympic Games at Athens, Greece, in 1896. Princeton professor William Miligan Sloane, head of the American Olympic Committee, recruited four Princeton undergraduates. Eight Boston-area athletes, including seven from either Harvard or the Boston Athletic Association, completed the American team. Americans captured nine of the 12 track-and-field events, finishing second in five more. American victors were Tom Burke in

the 100 meters and 400 meters, Tom Curtis in the 110-meter hurdles, Ellery Clark in the high jump and long jump, William Hoyt in the pole vault, Bob Garrett in the shot put and discus, and John Connolly in the triple jump. Americans also finished first in several track-and-field events at the 1900 Olympic Games at Paris, France. American winners were Frank Jarvis in the 100 meters, John Walter Tewksbury in the 200 meters and 400-meter hurdles, Maxey Long in the 400 meters, Alfred Kraenzlein in the 110-meter hurdles and long jump, Irving Baxter in the high jump and pole vault, Meyer Prinstein in the triple jump, Ronald Sheldon in the shot put, and John Flanagan in the hammer throw.

## trade, domestic and foreign

The completion in the Gilded Age of a national transportation network—virtually all of it RAILROADS—created a national market for manufacturers and traders to distribute their products. At the same time, the income of Americans was on the rise and ordinary people, farmers and workers, were acquiring more than the bare necessities of life. Consumerism was on the rise, creating mass markets in the United States. The rise of DEPARTMENT STORES, MAIL-ORDER HOUSES, CHAIN STORES, and the growth of ADVERTISING in the late 19th century all led to the increased flow of goods throughout the nation.

With the explosion of economic activity in the Gilded Age, internal trade in the United States multiplied in volume. Railroad freight roughly tripled from 1870 to 1900, when it totaled 141.6 billion ton-miles (a ton-mile is one ton moved one mile). While the MERCHANT MARINE on the whole languished, the tonnage of vessels engaged in coastwise and internal trade jumped from 2,638,000 in 1870 to 4,287,000 in 1900.

Although during the Gilded Age domestic markets absorbed most of the raw materials and finished products Americans produced, foreign trade also increased. In 1870 American exports were valued at \$451 million and imports at \$462 million, but by 1900 exports were at \$1.5 billion and imports at \$930 million. The excess of exports over imports throughout most of the Gilded Age was made up—since there has to be an equilibrium in foreign trade—by payments to foreign shipowners and operators, interest paid on European investments in the United States, and a steady inflow of gold that facilitated the resumption of specie payments in 1879 and generally lowered interest rates for Americans.

Most of American foreign commerce was with Europe, much of it with Great Britain. In 1870, 81 percent of American exports were bound for Europe, and Britain received more than half (53 percent) of all exports. In that same year 55 percent of all American imports came from Europe and more than a third (35 percent) originated in Britain. Thirty years later in 1900, American exports to Europe fell slightly to 75 percent (Britain dropped from 53 to 38 percent), while imports from Europe also fell slightly to 52 percent (with Britain falling from 35 to 19 percent). Among the trading partners of the United States in 1900, Germany was second (considerably behind Britain), receiving 13 percent of exports (only a third of what Britain imported from the United States), but as the source of 11 percent of all American imports, it was gaining on Britain.

The principal American export in the late 19th century was baled cotton. In 1870 it was worth \$227 million (more than half the value of all exports) and in 1900 \$242 million (less than one-fifth of all exports). Increasing exports of wheat and meat from the agricultural sector and of petroleum and machinery from the industrial sector of the economy account for the relative decline of cotton, although it remained the top export. Sugar was the top import in the Gilded Age, with \$57 million worth imported in 1870 and \$100 million in 1900. The second most important import in 1870 was iron and STEEL manufactures at \$40 million, but by 1900 the development of the American steel industry reduced those imports to relative insignificance. After sugar, the most important imports in 1900 were hides and skins, coffee, and then raw silk. The shifts in exports and imports reflects the enormous agricultural and industrial expansion of the United States.

### transportation, urban

Urban public transportation supported the rapid expansion of cities in the late 19th century and made possible the development of residential districts separated from places of work. Converging on a central point, public transportation lines created the “downtown” and the “hundred-percent corner,” the point of maximum accessibility where new institutions like DEPARTMENT STORES clustered.

By the 1870s the horse-powered street railway was the prevalent public transportation mode for large and small American cities. Starting in 1832, horsecars had steadily replaced horse-drawn “omnibuses.” The smooth rails doubled the load a horse could pull. In flat terrain, horsecars could travel seven miles per hour. Cities granted franchises for tracks on their streets in return for fare limitations

(five cents was the norm) and paving or street-sprinkling obligations.

Horses could work for only a few hours, and horsecar companies had to maintain as many as eight to 10 animals for each vehicle they owned. The West End Street Railway of Boston at one time stabled about 8,000 horses. Horses were polluting, generating about 10 pounds of waste per animal per day plus urine. Horses were also subject to disease. An equine epidemic in 1872 killed or disabled 18,000 horses in New York City, crippling public transportation.

Cable cars were the first attempt to overcome the limitations of horsecars. Andrew S. Hallidie, a California manufacturer of wire cable, designed a cable car in 1869 that was drawn by a continuous wire cable beneath the street. By 1873 a Hallidie car scaled Clay Street in San Francisco, and soon Nob Hill was covered with cable lines. The cable, driven by a cable drum in the power house, ran continuously at nine miles per hour. Individual cars used a grip extending downward through a slot to grasp the cable. The “gripman” needed skill to engage and disengage the cable smoothly when stopping or coasting around street corners.

Cable railways had their greatest success in San Francisco, but 30 other cities also operated cable cars. Chicago had the second-largest system, opened in 1882, while other major cable operators included Kansas City, New York City, the Brooklyn Bridge, Cincinnati, Washington, Seattle, and Tacoma. The San Francisco cable cars were designated a National Historic Landmark in 1964. A Washington “grip” car is displayed in the Smithsonian, and a Chicago grip car replica is in the Chicago Museum of Science and Industry.

The biggest urban transportation innovation was the rapid adoption of electric streetcars in the 1890s. After a successful installation in Richmond, Virginia, in 1887, city after city converted their horsecar and cable lines to electricity. The streetcars drew power from a “trolley pole” contacting an overhead wire, and the car itself was soon known as a “trolley.” Trolleys were faster than the horsecar, and the expansion of their lines opened new residential areas and recreational opportunities by extending to amusement parks and beaches. The electric trolley would remain the backbone of urban transportation in all but the largest cities until it was replaced by buses and the spread of automobiles starting in the late 1920s. In the largest cities, traffic congestion led to a search for alternatives. The steel-bridge industry made it practical to build continuous elevated viaducts above city streets, separated from pedestrians and vehicles below. New York City initiated the first steam powered “el” trains in 1871. Sioux City, Iowa, opened an elevated steam railway in 1890, and Chicago opened its first elevated line in 1892. The Chicago el lines converged on an elevated loop, which soon replaced the cable car loop

Electric trolleys competed with automobiles for space on city streets. (*Library of Congress*)

as the definition of Chicago's downtown. The West Side elevated line in Chicago was electrified in 1895, and soon electricity replaced steam on other el lines throughout the country.

The other solution was to burrow beneath city streets. London had opened its Metropolitan subway in 1863 using steam locomotives, but the use of coal-burning locomotives underground had obvious limitations. Alfred Beach, the New York publisher of *Scientific American*, advocated pneumatic subways, with differential air pressure moving a car through a closely fitting tunnel. He financed a demonstration line 312 feet long beneath Broadway in 1870. It was not mechanically practical, although further developed. An 1897 subway under Tremont Street in Boston diverted streetcars from the surface for a few congested blocks, but the first true subway, the Interboro Rapid Transit (IRT) in New York City, would not open until 1904.

### trusts

In the Gilded Age companies that monopolized or dominated an industry were called trusts. "Competition is industrial war," a large envelope manufacturer wrote in 1901. "Unrestricted competition, carried to its logical conclusion, means death to some of the combatants and injury for all. Even the victor does not soon recover from the wounds received in combat." An alarming sense that things were dangerously out of control as a result of unrestrained competition was common among business owners throughout the late 19th and early 20th centuries, but never more so than during the years following the panic of 1873.

Before that calamity, businessmen had enjoyed a relatively long period of prosperity that had lasted since the Civil War. This was due mainly to the extension and integration of the RAILROADS. In their rapid growth, they not only absorbed huge supplies of coal, iron, and STEEL, but they also enabled manufacturers in numerous industries to

invade markets in distant cities previously closed to them. Combined with a host of technological improvements that greatly lowered the costs of production and made it possible to turn out goods of uniform quality in large amounts, the market expansion stimulated by the railroads opened up vast new opportunities for profit that businessmen rushed headlong to seize. Investment and growth soared in sugar refining, agricultural implements, MEATPACKING, OIL production and refining, as well as in iron and steel and coal. But in their lust to capture new markets many businesses, whether they were in manufacturing or MINING, expanded capacity much too rapidly. This meant that whenever orders for a firm's product declined, it was under enormous pressure to expand sales by cutting prices to meet the new, substantial overhead costs it had taken on. When times were good, as they generally were before the depression of 1873, such price-cutting was not a systemic problem. Moments of falling or stagnant demand, when they appeared, were relatively short and were quickly followed by another burst of growth. But after 1873 conditions changed dramatically. Demand did not rebound but declined sharply, triggering a desperate struggle for survival among producers in every sector of the economy. Cutthroat competition and price wars became the norm as each business tried to hang on as best it could. Marginal firms with older, less efficient facilities and higher fixed costs failed by the thousands. Only those with the lowest costs of production or some other competitive advantage managed to remain afloat even as they reduced prices, laid off workers, and scaled back in anticipation of even more canceled orders.

In this vortex of falling demand, many businesses sought shelter not merely by slashing prices and costs. They saw the solution to the problem of survival as one of taming market forces through strategies aimed at limiting competition. Precedents for this existed well before the depression of 1873. As early as 1817, salt producers along the Kanawha River in the Ohio Valley formed the Kanawha Salt Company to set production quotas and prices for each member firm. Before the Civil War, cotton manufacturers in Rhode Island and Massachusetts sometimes joined together "in unison" to set prices on yarns, and during and after the Civil War, established firms in the anthracite coal industry sought stability in prices and output by entering into agreements with railroads that made it difficult for new entrants to get their coal to market. The depression merely accelerated the search for new and more effective ways to harness what many viewed as suicidal, cutthroat competition.

Railroads serving the anthracite coal fields pioneered one early technique to stanch the bloodletting. Operating on the philosophy that it was better to combine than compete, they entered into a series of "gentlemen's agreements" imposing freight rates, and there were informal, voluntary

"understandings" to set quotas or shared percentages of the total coal shipments to market. "Pools" were established to combine both methods of cooperation. Errant members of the pool who exceeded their quota or cut prices below a certain level would suffer fines or, according to the details of each agreement, other punishment to bring them back into line. Such pools soon arose in other battered industries. By the 1880s, observers spoke of a whiskey pool, a cordage pool, a lead pool, a salt pool, as well as multiple railroad and coal pools. But however effective these pools might have been at first in stabilizing prices in various industries, they all eventually unraveled because, as John D. Rockefeller complained, reflecting on the collapse of his own pools in the oil business, they were "ropes of sand." The legal system did not recognize such arrangements. Indeed, they were violations of the common law's prohibition of contracts "in restraint of trade," so when businessmen cheated on their quotas or secretly cut deals on prices, all that their victimized colleagues could do was rail at the unfairness of it all.

But another, far more effective method to stifle competition and stabilize markets would be fashioned by an inventive lawyer, Samuel C. T. Dodd, for his client, John D. Rockefeller and the Standard Oil Company of Ohio. In 1882 Dodd came up with the concept of utilizing an old legal contract, the trust agreement, to get around a barrier in 19th-century commercial law disallowing corporations from owning stock in other companies or to control businesses in jurisdictions outside of the states where they were incorporated. The trust concept would override these legal constraints, and thus it fit in perfectly with John D. Rockefeller's vision and philosophy. Rockefeller, who entered the oil business in 1862 and quickly became the dominant figure in the Standard Oil Company, was appalled by the chaotic, unrestrained competition the oil business exhibited in the 1860s. Even though his own firm did well in that environment, his principal objective from the start was to eliminate what he viewed as wasteful competition. Demanding and getting rebates from railroads on oil shipments (and even getting drawbacks, or kickbacks, on shipments by competitors), Rockefeller and his partners in Standard Oil soon succeeded in driving out independent refining competitors. By 1879 it either owned or had under lease 90 percent of the nation's refining capacity. But the company's management and organization remained cumbersome and ill-suited to Rockefeller's ambitions. When, for example, Standard Oil did business in states outside of Ohio, it was liable for taxes in those jurisdictions. It could have gotten around this by taking out corporate charters in each state, but then it would have had to open its books for inspection, a prospect the secretive Rockefeller was determined to avoid. Equally disturbing, management decisions were often delayed and prolonged because Standard Oil's con-

Cartoon depicting Uncle Sam as a farmer facing the many-headed monster of national trusts, 1887 (*Library of Congress*)

trol of many of the properties it brought into its orbit was not absolute. The holdover owners and managers of those companies still owned stock and had to be consulted.

The Standard Oil Trust Agreement—signed on January 2, 1882, by 41 stockholders holding trust certificates valued at \$70 million—resolved many if not all of these issues and more. Under its terms, nine trustees, the functional equivalent of a board of directors, were given absolute control over the management of the properties Standard had in its portfolio. In return for handing over their stock to the trustees, the shareholders in those properties received trust certificates, which were the functional equivalent of common stock but without its voting privileges. This arrangement not only allowed Standard Oil to circumvent the laws of Ohio and many other states barring corporations from holding stock in other corporations, but it enabled the company to transform itself into a highly centralized organization. Just as importantly, under the trust agreement the inner workings of the company were wrapped in secrecy, since, legally, this corporation did not exist, lacking as it did either a legal name or a charter.

As a semisecret body having no legal existence, the trust device provided Rockefeller and his fellow trustees with the means to achieve precisely what they had long sought: the ability to employ their assets free from public scrutiny, which allowed them to control from one headquarters the oil refining industry of the nation. And Standard Oil did so on a scale never experienced before. The worth of the various companies that entered into the agreement in 1882 amounted to about \$72 million; 10 years later, Standard was conservatively estimated to be worth about \$121 million—and growing.

Nevertheless, it was impossible to keep the Standard Oil Trust Agreement entirely secret, and as rumors of its existence were bruited about, numerous stories appeared in newspapers and magazines warning about monopolistic trusts being formed in such disparate industries as lead, school slates, envelopes, linseed oil, cottonseed oil, paving, pitch, salt, cordage, sugar, and countless more. “It is the aim of those who make these combinations,” the *New York Times* intoned, “to kill competition at home, and to exact from consumers a price high enough, . . . [and] as great a

tax as they must pay the Government when they buy the same kind of goods from foreign manufacturers.” Social reformers and critics like HENRY DEMAREST LLOYD, who had already authored a harsh expose of Standard Oil entitled “The Story of a Great Monopoly” in 1881, were quick to denounce trusts as a new breed of corporate monster that would destroy the competitive system and even the republican form of government itself if not restrained.

Such concerns were justified. The Standard Oil Trust was a monopoly that had absorbed or eliminated virtually all rivals and had successfully imposed its control over both the prices for crude oil it still purchased (Standard Oil would become an oil producer later in its corporate history) and the prices it received for finished petroleum products. Yet, only a few of the many trusts established during these years, like the Sugar Trust, did as well as Standard Oil in eliminating competition and controlling prices—in short, monopolizing its market. Most trusts failed to achieve these goals, and even the Standard Oil Trust—though not its market dominance—turned out to be short-lived.

Even as the SHERMAN ANTITRUST ACT was being enacted in the summer of 1890 in response to the growing public chorus demanding that Washington do something, anything, to rein in the trusts, they were under withering legal assault in state courts. Louisiana brought suit against the Cottonseed Trust in 1887, New York against the Sugar Trust in 1889, and Ohio against the Standard Oil Trust in 1890. In January 1890, a New York court ruled that the Sugar Trust was in violation of the common-law prohibition against restraints of trade, a decision soon affirmed by courts in other states. All trusts brought to book by these rulings appealed, but to no avail. By 1892, when the Ohio Supreme Court upheld the lower court’s decision against the Standard Oil Trust and ordered it dissolved, the trust movement came to an end.

However, industrial consolidations and combinations did not cease. They simply continued in a different guise made possible, in 1889, when New Jersey revised its general incorporation laws to allow any corporation situated in the state to hold the securities of subsidiary corporations chartered there. Accordingly, as trusts ran afoul of various state laws, many applied to New Jersey for charters to do business and became “holding companies.” The Cottonseed Oil Trust was the first to take advantage of the new law, reconstituting itself in November 1889 as the American Cotton Oil Company. Five months later the Lead Trust became the National Lead and Oil Company of New Jersey, and in January 1891 the Sugar Trust received a New Jersey corporate charter in the name of the American Sugar Refining Company. Standard Oil remained, for complex legal reasons, a “trust in liquidation” after the Ohio Supreme Court’s 1892 ruling and remained so for some time, continuing to run its business under an Ohio charter much as before. Finally, in 1899, three years after New Jersey further liberalized its

statutes to allow corporations to hold stock in companies chartered elsewhere and only when it was threatened with further court action in Ohio, did Standard Oil reincorporate itself in New Jersey as a holding company, the Standard Oil Company of New Jersey. But except for its new legal form and change of address, the company remained unchanged.

In theory, holding companies had to own more than 50 percent of the voting stock of any subsidiary they acquired. But in practice, operating control could be accomplished with a far smaller slice of outstanding stock, particularly when shares became more widely dispersed. As a financial and organizational tool, therefore, holding companies were perfectly suited to those ambitious businessmen seeking to merge one corporation with another, thereby growing bigger, more powerful, more dominant, more able to control their own destiny without fear of competition.

With the exception of the trusts that reorganized themselves as holding companies, businessmen were slow to take advantage of New Jersey’s inviting corporation laws. Consolidations of all sorts virtually ground to a halt during the depression years of 1893–97. But in 1898 and continuing until 1905, an unprecedented wave of mergers, estimated at more than 3,000, swept through the American economy. Startling in its dimensions and scope, this merger wave transformed the structure of American industry as no other combination movement had before. In 1865 most businesses were small. No single company controlled any industry. By 1905, however, about 328 large corporations, most of them the product of mergers after 1898, were estimated to own two-fifths of the \$20-billion industrial wealth of the nation. And of those 328 large firms, as many as 156 were dominant enough to have some monopoly control in their particular industry.

Clearly, the oft-expressed desire of businessmen to be free of the debilitating effects of unrestrained competition was one of the major forces propelling this wave of mergers. As JOHN PIERPONT MORGAN, the investment banker behind many of the largest mergers of this period, put it, “I like a little competition, but I like combination better.” But why did so many of the combinations he so obviously wanted and brought to such profitable fruition begin to take shape on the industrial landscape only after 1898? Many compelling reasons have been advanced. For one thing, the SUPREME COURT, in its decision in the *E. C. Knight* case (1895) eviscerated the Sherman Antitrust Act’s principal provision, holding “Every contract, combination in the form of trust or otherwise . . . in restraint of trade . . . to be illegal,” and by so doing implicitly gave a green light to consolidations under the New Jersey holding-company statutes. Combined with the coincident return to prosperity following the end of the depression of 1893–97, the newly permissive government attitude toward combinations set the stage for an outburst of merger activity. Adding fuel and energy to the process was the maturation of the capi-

tal markets under the vigorous leadership of investment bankers like Morgan, who were increasingly employing the stock exchange to float the newly minted securities generated by each merger.

The public's appetite for stocks and bonds was growing substantially during this period, and Morgan and fellow financiers were happy to feed it. Underwriting these mergers proved extremely profitable for them, and the more mergers there were, the greater were the profits to be had. In other words, mergers were a virtual circle of moneymaking, especially for insiders. When, for example, Morgan persuaded ANDREW CARNEGIE and eight of his largest competitors in the steel industry to sell out and created, in 1901, what was the greatest merger of the age, the United States Steel Corporation, everybody involved did fabulously well. Carnegie and his partners came away with \$492 million, while Morgan pocketed even more. He sold the shares of the newly formed company for \$1.4 billion, which was \$700 million in excess of what he paid for all of the firms that became U.S. Steel. Morgan, it is true, pursued mergers because he sincerely believed it was in the public interest to end the economic havoc wrought by unrestrained competition. But he was even more vigorous in his pursuit of money and the countless works of fine art, rare manuscripts, and antiques money allowed him to possess for his personal pleasure and enjoyment. The mergers Morgan engineered clearly enabled him to satisfy both of these passions. Whether they were just as beneficial to the turn-of-the-century American consumer and laboring man, however, is still being debated. Critics of Carnegie, Rockefeller, and Morgan have called them "robber barons" for their excessive profits derived from monopolizing industry and eliminating competition. Their defenders have countered that their compensation was repaid by the efficiency and order they imposed on chaotic business conditions.

**Turner, Frederick Jackson** (1861–1932) *historian*  
Frederick Jackson Turner, born on November 14, 1861, in Portage, Wisconsin, was a distinguished professor of history at the University of Wisconsin and Harvard University.

In 1893, three years after the superintendent of the census announced that a frontier line no longer existed, Turner at the annual convention of the American Historical Association discussed the end of the frontier and argued that "the existence of an area of free land, its continuous recession, and the advance of American settlement westward, explain American development" of its democratic institutions and the habits and character of its people.

Turner believed that conquering, occupying, and establishing small communities on the expanding frontier forced Americans to work cooperatively, trust one another to carry out agreements, and reconcile the needs of individualism with democratic government. These human qualities described and explained the greatness of American life. Turner's views were both celebrationist and pessimistic. He was concerned that the passing of the frontier emphasized the depletion of natural resources and also removed the safety valve that enabled the unemployed to seek and find opportunities in the West. With the frontier at an end, how could American democracy and greatness survive if there were no continuing frontier to give renewed birth to American greatness? Turner's vanishing-frontier thesis brought together three major, and for many, troubling forces affecting American society: the end of frontier settlement, the rapid growth of industrial capitalism into an integrated market economy centered in new cities, and the need to extend democratic ideals to new immigrants from eastern and southern Europe coming to America for jobs in the new industrial economy. While Turner believed that the frontier explained much of American development, he also recognized that sectionalism was "fundamental in American history." Indeed, much of his research was on voting patterns and geographical conditions illustrating the persistence of sectionalism, the results of which were summarized in his *Significance of the Sections in American History* (1932), published after his death on March 14, 1932, in Pasadena, California.

Turner's persuasive work on sectionalism has been widely accepted, but the frontier thesis—especially its celebrationist ideas—has provoked critics, many of whom are urban in background. Some have pointed out that there was no safety valve, that the down-and-out in urban America had neither the cash nor the skills to get them out to, or to survive on, the frontier. His rosy picture of the frontier ignored lawlessness and violence, the fate of NATIVE AMERICANS, Asian immigrants, and Chicanos, and the profligate waste of resources. Other critics note that the frontier did not produce unique American forms of government or legal systems. They argue that new states largely imitated the states of the earlier eastern frontier, which in turn had imitated English forms. Turner's critics emphasize that ideas about government, law, voting, and democratic politics were brought to the frontier and did not automatically "germinate" from frontier life. Finally, critics claim that American life was more than its institutions. Turner's thesis could not

explain the growth of American SCIENCE, LITERATURE, ART, MUSIC, and other cultural forms. Clearly, Turner's work stimulated research on the frontier and its influence. If it could not explain all American life, it offered for many a compelling argument for American uniqueness.

**Turner, Henry McNeal** (1834–1915) *bishop, politician, back-to-Africa proponent*

Henry McNeal Turner, an African Methodist Episcopal (AME) bishop, was born free on February 1, 1834, in Newberry Courthouse, South Carolina. Despite the state prohibition against AFRICAN AMERICANS learning to read, he learned to read and also was tutored in arithmetic, history, law, and theology by lawyers for whom he worked in Abbeville as a janitor. Deeply religious, he was licensed by the Methodist Episcopal Church, South, in 1853 to preach, and in 1858 he joined the AME Church. From 1858 to 1863 he ministered to AME churches in Baltimore and Washington. After organizing a black Civil War regiment, Turner became the war's first black chaplain. He was a gifted orator and successful revivalist and went to Georgia after the end of the war and organized churches.

Turner soon went into politics. The Reconstruction Act of March 2, 1867, called for African Americans to help rewrite the constitutions of those states undergoing Reconstruction. Turner was a delegate to Georgia's constitutional convention. He was elected to the state's legislature in 1868, but white reactionaries in 1869 expelled the two senators and 25 representatives; all were black. Turner, who represented Bibb County, strongly protested his expulsion. He informed the Georgia legislature that he was a duly elected member of their body: "therefore, I shall neither fawn or cringe before any party, nor stoop to beg them for my rights. I am here to demand my rights, and to hurl thunderbolts at the men who would dare to cross the threshold of my manhood." Turner vowed that black men would not fight to defend a nation that would not honor their rights of citizenship and manhood. Thanks to the influence of Senator Charles Sumner, Turner was then appointed postmaster of Macon, but an alleged involvement with a prostitute soon forced his resignation. Congress, however, in 1870 restored the expelled legislators to their seats, and Turner filled out his term but failed to be reelected. Turner then secured a federal civil service appointment in the Savannah customhouse.

At Savannah, Turner also pastored an AME church and remained active in church affairs. He was in 1876 made the

manager of the AME Book Concern in Philadelphia, where he was responsible for publishing *The Christian Recorder* and other church publications. During his tenure there he clashed with BENJAMIN TUCKER TANNER, editor of the *Recorder*, over how to settle the Book Concern's debts, how to increase readership, and how to persuade subscribers to pay their arrears.

Turner was elected a bishop in 1880 and served in that capacity until his death in 1915. He was the center of several controversies in the church. There was opposition to his insistence that clergy wear vestments and follow ritual, and fellow bishops questioned his decision in 1885 to ordain Sarah Ann Hughes to the ministry. In 1887 Bishop Jabez Campbell rescinded this act at a North Carolina annual conference of bishops. Turner also shocked many with his declaration that "God is a Negro." He contended that blacks would always feel inferior if they worshiped a European image of God while believing that the devil was black.

With the end of Reconstruction, Turner vigorously advocated African-American immigration to Africa to civilize and Christianize the continent. Turner was a longtime advocate of immigration to LIBERIA, and he was criticized for serving since 1876 as a vice president of the American Colonization Society, an organization that had promoted a back-to-Africa program since the 1820s. Turner traveled to Africa several times in the 1890s to oversee the AME Church's mission efforts in Liberia, Sierra Leone, and South Africa. There he founded annual conferences and schools, and upon his return he published exaggerated reports extolling the richness of the land and the possibility of development. Critics castigated him for encouraging people to immigrate to a land of disease, poverty, and high death rates, and among these critics his old adversary Tanner was a major voice. Turner called for a convention in 1893 to meet in Cincinnati to organize emigration to Africa, but he was bitterly disappointed when the delegates rejected migration to Africa as impractical. Turner continued to argue that African Americans would never have the respect of others until black men ruled themselves and that their presence in America would limit them to be nothing more than "menials, scullions, servants, subordinates and underlings." He edited *The Voice of Missions* (1893–1900) and *The Voice of the People* (1901–04) and used both organs to express his personal views on immigration to Africa.

Turner opposed the SPANISH-AMERICAN WAR and suggested that blacks should not fight for a government that could not protect their rights in the South. He was so bitterly opposed to American racism that he vowed never to die in America. His wish was granted when he suffered a severe stroke and died on May 8, 1915, in Windsor, Ontario, Canada. His body was returned to Georgia for burial. Turner is honored throughout the United States

with churches named after him. In 1900 the AME Church founded Turner Theological Seminary at Morris Brown College in Atlanta.

**Twain, Mark (Samuel Langhorne Clemens)** (1835–1910) *novelist, journalist, lecturer*

Perhaps the most influential American literary voice ever, Mark Twain was born Samuel Langhorne Clemens in Florida, Missouri, on November 30, 1835, and grew up in Hannibal, Missouri. His father, a lawyer who speculated unsuccessfully in land, died when Twain was 12, and he was then apprenticed as a printer. As a journeyman printer during 1853 and 1854, he worked his way to St. Louis, New York, Philadelphia, and Keokuk, Iowa. On his way to New Orleans in 1857 he became an apprentice pilot on the Mississippi River and was a full-fledged river pilot when the outbreak of the Civil War shut down the Mississippi.

In 1861 Twain joined a volunteer militia affiliated with the Confederacy and discovered that he strongly disliked military life. He was able to quit after two weeks when Missouri did not secede from the Union. Feeling deeply conflicted about the war, he moved to Nevada with his brother, Orion, a unionist who had become secretary of the territorial governor of Nevada. In Nevada, Twain became a prospector and later, in 1862, a reporter in Virginia City. It was there that he first used the pseudonym Mark Twain, a river term for two fathoms deep (or safe water). The pseudonym quickly took on a personality of its own, and his adoption of it marked the beginning of his literary career.

In 1864 Twain moved to California, where he found work as a reporter. In 1865 he wrote a short story, “The Celebrated Jumping Frog of Calaveras County.” A California newspaper then sent him to the Sandwich Islands (now Hawaii) as a roving reporter. His articles were well received, and in 1866, after his return, he lectured very successfully in the West, beginning a phenomenally successful second career.

Twain’s first book, *The Celebrated Jumping Frog of Calaveras County and Other Sketches*, was published in 1867. He gave a triumphant lecture at Cooper Union in

Mark Twain (Library of Congress)

New York, then set sail for the Mediterranean and the Holy Land as a roving reporter for another California paper. The reports he sent back were even more successful than his reports from the Sandwich Islands and formed the basis for *The Innocents Abroad* (1869), which turned him into a national figure. His take on the Old World—and the new type of American tourist that had begun visiting it—was unique, surprising, and funny.

In 1870, after his return to America, he married Olivia Langdon; they made their home in the Northeast, primarily in Hartford, Connecticut. He relied on her, and later on WILLIAM DEAN HOWELLS, to tell him which of his writings were too outrageous to print. Over the next 30 years, his output was impressive. *Roughing It* (1872) recounted, semifictionally, his experiences in the Far West. He followed that up with *THE GILDED AGE* (1873), written with Charles Dudley Warner, an on-target satire on contemporary foibles and corruption that captured the spirit of an era. *The Adventures of Tom Sawyer* (1876), based on memories of his boyhood in Hannibal, demonstrated a sure comic touch. *The Adventures of Huckleberry Finn* (1884), about a runaway boy and an escaped slave on a raft on the Mississippi River, is a certified classic. Its natural use of a wide array of Southern dialects demonstrated just how well Twain understood the spoken word, but that was only a small part of what made the book compelling. Most noteworthy were its comic skewering

of human gullibility and venality and its insights into just how twisted conventional morality can get. The passages in which a guilt-racked Huck found himself unable to betray Jim, the runaway slave, even though he was convinced that he would be sent to hell for helping to “steal” the rightful property of someone else, are among the most gripping in literature.

Twain's other books included *A Tramp Abroad* (1880), *The Prince and the Pauper* (1882), *Life on the Mississippi* (1883), *A Connecticut Yankee in King Arthur's Court* (1889), *Tom Sawyer Abroad* (1894), *Tom Sawyer, Detective* (1896), *The Tragedy of Pudd'nhead Wilson and the Comedy, Those Extraordinary Twins* (1894), and *Personal Recollections of Joan of Arc* (1896).

Although his writings often mocked the speculative mania that gripped the nation during the Gilded Age, Twain himself was far from immune, losing a good deal of money on several speculative ventures and spending lavishly on his Hartford home. He continued to write and lecture up until his death on April 21, 1910, with his later writings show-

ing a more bitter cast. At the end of his life, he dictated an autobiography that was published posthumously.

Twain is best remembered for his clear, compelling, and unadorned prose; his remarkable ear for spoken language; his comic flair; and his unique slant on life. “Always do right,” he told the young people's society of a Brooklyn Presbyterian Church in 1901. “This will gratify some people and astonish the rest.”

## Tweed Ring

The spectacularly corrupt Tweed Ring was led by William M. Tweed (1823–78), who held a number of municipal posts in New York City in the 1860s, including deputy street

A political cartoon portraying William M. Tweed as a bullying schoolteacher giving New York City comptroller Richard B. Connolly a lesson in arithmetic. The exaggerated bills for the building of a county courthouse are posted on the wall. (Library of Congress)

commissioner and deputy commissioner of public works. He increased his power through his control of appointments and the awarding of contracts, and by 1868 he was the leader of the Democratic machine, the grand sachem (leader) of TAMMANY HALL, and in complete control of the administration of New York City. Taking advantage of home-rule features in a new city charter secured by bribery from the New York State legislature, Tweed and his close associates—Mayor A. Oakey Hall, Peter B. Sweeny, and Richard B. Connolly—began in 1869 to steal from the city on so spectacular and so organized a scale that the Tweed Ring has overshadowed all other municipal corruptionists in American history. Its most conspicuous, but certainly not the only, source of graft was the construction of the new county courthouse. Not only did contractors purchase building materials from companies in which Tweed had an interest, but they also padded their bills and shared excessive payments with the ring. Since Tweed was on the Board of Audit, these fraudulent bills were not challenged. When construction was finished, the cost of the \$12 million courthouse had been multiplied three times.

The Tweed Ring was short-lived. The cartoonist THOMAS NAST began in 1870 to attack Tweed and his cohorts with devastating caricatures in *Harper's Weekly*, and the ring's downfall came in 1871 when disgruntled insiders leaked damning evidence to the *New York Times*.

Citizens were aroused. SAMUEL J. TILDEN, the state Democratic leader, belatedly turned on Tweed (enhancing his reform reputation), and Tweed was overthrown, prosecuted, and convicted in 1873 for not properly auditing bills. He was imprisoned, escaped to Spain, but was extradited and returned to jail, where he died.

The effrontery of the Tweed Ring and the sheer volume of its stealings—perhaps as much as the \$30 million Tilden alleged—obscures the rapid development of New York during the years Tweed was in power. Extraordinary municipal graft required extensive civic projects, including improved transit facilities, the widening of Broadway, and the development of Central Park. Payoffs and graft were powerful incentives that brought disparate elements, which normally paralyzed action, together to work (and steal) in concert on major undertakings. Indeed, the urban historian Seymour J. Mandelbaum argues that by uniting fragmented neighborhoods and ignoring the frugality prized by taxpayers and the morals of reformers, Tweed and his accomplices stole the city rich.

## utopianism

American publishers released more than 150 utopian novels between 1885 and 1900. The outpouring of literary descriptions of the ideal perfect social order betrayed a society uncertain of its future. Part of that uncertainty reflected the fear of cataclysm that accompanies the ending of a century. But the greatest contributor to this doubt was the rift between values and reality caused by industrialization. Labor conflict, the increasing gap between rich and poor, the displacement of farmers, and the growing concentration of economic power—all of which apparently refuted the principles of republicanism—left Americans aghast and seeking answers.

EDWARD BELLAMY's *Looking Backward* (1888) was one of the most widely read utopian solutions for the troubled society. Placed in the year 2000, Bellamy's perfect social order enjoyed an equality of abundance made possible by a nationalized economy. Universal public service guaranteed the production of goods and services. Education, rather than revolution, secured this ideal world, as its unselfish citizens recognized that it made more sense to cooperate and share (rather than compete and amass) surpluses resulting from efficient large-scale production and demanded the abolition of all forms of private property.

The road to utopian bliss was not so peaceful in Ignatius Donnelly's *Caesar's Column*, published in 1890. Donnelly depicted late 20th-century America (the novel is set in 1998) as sated in luxurious splendor. But he has the main character, Gabriel Weltstein, a visitor from Uganda, discover that the grandeur is only a facade disguising a tyranny ruled over by Prince Cabano and the Council of Oligar-

chy. Their greedy despotism has enslaved the productive classes, reducing them into submissive "automata." The repressive exploitation generates a revolutionary movement, the Brotherhood of Destruction, headed by Caesar Lomellini, a dispossessed farmer. The Brotherhood's victory ignites an orgy of killing and looting. Concerned over the health threat posed by so many exposed cadavers, Caesar orders them placed in a cement column ringed with explosives. But once unleashed, the violence cannot be contained, and Caesar is killed and his head placed on a stake. All, however, is not lost, for Weltstein escapes the bloody chaos and returns to Uganda, where he establishes a harmonious society based upon government ownership of the factors of production.

Utopianism's identification of private property as the source of greed and inequality and the progenitor of evil echoed the views of Christian communes founded before the Civil War. Most of those experiments in utopian communism ultimately succumbed to capitalism. The Oneida Perfectionist Community, renowned for its production of silver flatware, ended its experiment in communal property in 1879 by becoming a joint stock company. The longest-lasting religious commune, the Amana Community, reorganized as a joint stock company in 1932.

Utopianism's rejection of private property also mirrored SOCIALISM. It differed from that doctrine, however, in that it had a clear vision of what might be, but only vague notions on how to achieve utopia. Socialists, whether Lassalleans or Marxists, suggested more concrete strategies for abolishing individual property.

## **Venezuela boundary dispute** (1895)

A serious disagreement arose in 1895 when the United States intervened in the stalled negotiations between Great Britain and Venezuela over the boundary of British Guiana. Britain adhered to the line drawn by surveyor Robert Schomburgk in 1840, while Venezuela adhered to a line that enveloped almost all of British Guiana. Intermittent talks went on for years to no avail. When the British, frustrated by Venezuelan intransigence, claimed land beyond the Schomburgk line, where gold had recently been discovered, Venezuela in 1887 suspended diplomatic relations with Great Britain.

In 1894 American concern about the dispute intensified with the publication of a pamphlet, *British Aggressions in Venezuela or the Monroe Doctrine on Trial*, whose author, William L. Scruggs, a former American minister to Venezuela, depicted Britain's position as a deliberate violation of the Monroe Doctrine. The essay prompted CONGRESS to unanimously pass a resolution urging arbitration of the matter and convinced President GROVER CLEVELAND of the need to forcefully address the issue. Secretary of State Richard Olney, an impatient, irascible railroad attorney from Boston, sent a letter to London, with Cleveland's approval, claiming in a hyperbolic tone that "the United States is practically sovereign on this continent, and its fiat is law." He also described the insidious nature of the British presence in Latin America and the need to arbitrate the dispute.

The British prime minister, Lord Salisbury, waited four months before responding that the Monroe Doctrine did not apply, since the British presence in Guiana antedated the Republic of Venezuela, and Britain continued to refuse to arbitrate. Outraged by both the delay and the response, Cleveland on December 17, 1895, answered Salisbury by asking Congress for funds for a commission to determine

the boundary line and vowed that the United States would use "every means in its power" to uphold that line.

A brief war scare ensued, but tempers cooled after a few days. The British (feeling menaced by Germany and anxious for American friendship) backed off and showed a willingness to arbitrate. Olney also backed off and agreed that territory occupied by either side should not be subject to arbitration for 50 years. Utilizing the good offices of the United States, a treaty of arbitration between Britain and Venezuela was signed on February 2, 1897. On October 3, 1899, the arbitration panel—consisting of two Britons, two Americans, and one Russian—fixed the boundary roughly along the Schomburgk line, although Britain lost control of the mouth of the Orinoco River and 5,000 square miles of territory at the southern end of that line.

Despite the bluster of Cleveland and Olney that could have had disastrous consequences, the Venezuela boundary dispute turned out well for the United States. It forced Britain to recognize American hegemony in the Caribbean, strengthened the Monroe Doctrine, gave impetus to the arbitration of disputes, and ultimately improved Anglo-American relations.

## **Victorianism**

*Victorianism* is the term used by some social and cultural historians to refer to certain beliefs, assumptions, codes, tastes, behaviors, and social arrangements associated principally, but not exclusively, with the middle class in Britain and the United States during much of the 19th century.

Like any label that purports to cover diverse social and cultural phenomena, *Victorianism* is problematic. Historians do not agree on the exact chronology or content of Victorianism. Some scholars, even allowing for strong transatlantic influences, question whether a label imported from monarchist Britain can accurately describe developments in republican America. Others avoid the term altogether because to moderns it has long been a pejorative, suggesting narrow-mindedness, hypocrisy, and prudery.

Nevertheless, some of the most subtle and perceptive commentators on 19th-century America have found *Victorianism* to be both valid and useful. That is because, by and large, the American middle class, like its British counterpart, shared well-defined values and tastes during the period. To earn approval, the arts, LITERATURE, and popular ENTERTAINMENT had to be consistent with the social codes of Victorianism. The 1893 Chicago WORLD'S COLUMBIAN EXPOSITION, for instance, celebrated Victorian confidence and faith in progress. In art, Victorianism meant romanticized history, uplift, pathos, and idealizations of middle-class life. In THEATER, Victorians preferred melodrama, in which good conquered evil. In literature, they favored romanticism and gentility. Culture typically upheld such Victorian values as polite behavior, social order (especially patriarchy and Protestantism), duty, and self-restraint.

Victorians, whether in Britain or the United States, considered behavior to be the outward expression of character, hence their emphasis on integrity, good grooming, propriety, and emotional control. Sexual prudence, if not prudery, was an essential part of the code, especially for women, though modern studies have argued that Victorian sexuality differed from that of later eras only in vocabulary, not in passion. Eros, it seems, was as powerful as ever, but it was not admitted into polite discourse or public demeanor.

The behavioral standards of Victorianism were not limited to the middle class. They could be extended to other groups, though expectations varied, depending upon gender, race, class, ethnicity, or RELIGION. Servants, laborers, immigrants, even racial minorities, could earn respect, if not status, by honoring the code. Victorianism also made allowances for (and perpetuated) presumed gender differences by consigning women to a "domestic sphere" and by limiting the "public sphere" almost exclusively to men.

Women were, however, significant agents of Victorianism at both home and church. In their domestic sphere they were arbiters and exemplars of culture, manners, and morals for family and even servants. Also active in church work, women joined with ministers to propagate a "culture of feelings," the sentimental (some would say "feminine") aspect of Victorianism. Beyond hearth and pulpit, schools,

armed with their McGuffey readers, were also strongholds of Victorian values.

Of course, not everyone adhered to Victorianism, though it was the standard against which moralists defined deviancy. Even among its adherents, tensions and strains often surfaced. Indeed, women frequently found it difficult to reconcile the contradictory Victorian notions of "true womanhood" (emotional, dependent, gentle, passive) and "ideal motherhood" (practical, self-reliant, strong, protective, nurturing).

As the 19th century drew to a close, Victorianism faced powerful new challenges. Social and political unrest, IMMIGRATION, and economic change jarred the middle class. Gilded Age opportunism undermined Victorian moralism. Popular entertainment offered more amusement and pleasure and less uplift. In art and literature, realism and naturalism challenged gentility and romanticism. On the intellectual front, the theories of Darwin, Marx, and Freud threatened cherished Victorian pieties. Even anti-modernists, such as HENRY ADAMS, defected from Victorianism. Although social and cultural reorientation was well advanced by the 1890s, Victorianism did not finally give way to modernism until the second quarter of the 20th century.

### **Villard, Henry** (1835–1900) *businessman, journalist*

Henry Villard was not only a journalist and a reformer but also a financier and a railroad president. Born in Speyer, Germany, on April 10, 1835, Villard migrated to America in 1853, bouncing from job to job in the Midwest until 1858 when he began a career in journalism as a correspondent for the New York *Staats-Zeitung* and covered the Lincoln-Douglas debates. He switched to the Cincinnati *Commercial* in 1859, reported on the Pikes Peak gold rush in Colorado, and was in Chicago for the 1860 Republican National Convention. He described Civil War battles for the New York *Herald* and later for the New York *Tribune*, and after the war in 1865 he became the Washington correspondent of the *Chicago Tribune* and was its man at the 1867 Paris Exposition.

Like his fellow German immigrant CARL SCHURZ, Villard was a supporter of liberal reforms. Those ties were strengthened in 1866 by his marriage to Helen Frances "Fanny" Garrison, the daughter of abolitionist William Lloyd Garrison. In 1865 a number of eastern patrician reformers had established the American Social Science Association to analyze problems and to promote the answers—CIVIL SERVICE REFORM, free trade, MONETARY POLICIES—which they already had in hand. Villard became the association's secretary in 1868 and, combining diligence and charm, drummed up support for its program and made useful contacts. By 1870 Villard embarked on a career in finance and was able in 1881 to support the liberal reform agenda by purchasing the *New York Evening Post* and the weekly *The NATION*, installing Schurz and EDWIN L. GODKIN as coeditors.

After a slow start, Villard succeeded in finance because he took advantage of the depression following the panic of 1873 that plunged many RAILROADS into bankruptcy. In Europe from 1870 to 1873, he used his family connections and returned to the United States as the representative of German investors in the Oregon & California Railroad. With that leverage, Villard helped reorganize it and the Oregon Steamship Company, assumed the presidency of the Oregon Steam and Navigation Company in 1879 and became the dominant force in transportation in the Pacific Northwest. Villard's brilliant accomplishments as a reorganizer earned him the backing of the investment banker JOHN PIERPONT MORGAN, who supported Villard's acquisition of the Northern Pacific Railroad (NPRR) in 1881. Morgan also backed Villard's optimistic plunge into a massive NPRR construction program that linked the Great Lakes with his Oregon properties. The enormous cost of completing the NPRR just in time to take the brunt of the next economic slump (1883–86) left the NPRR deeply in debt, and Villard was ousted from its presidency in 1884. Morgan, however, did not lose faith in Villard, and he was back on the NPRR board of directors in 1888 and became its chair in 1889. With Morgan's backing, Villard in 1890 gained control of the Edison Lamp Company of Newark, New Jersey, and the Edison Machine Works of Schenectady, New York; he combined them in 1891 as the Edison General Electric Company and named himself president.

Villard's financial career, which took off in the depression of the 1870s, was terminated by the panic of 1893. His optimistic tendency to overreach again proved to be his undoing, and his two major enterprises had to be reorganized. As a result, in 1893 he was removed from the board of directors of the NPRR and from the presidency of Edison General Electric, which was reconstituted as the General Electric Company. Villard died at Dobbs Ferry, New York, on November 12, 1900.

### violence and lawlessness

Gilded Age America was a violent society, especially in the South and the Southwest. The Northeast and Middle West had their spectacular murders, like that in 1872 of Jim Fisk, the Wall Street speculator, or the ax murder of the parents of Lizzie Borden in Fall River, Massachusetts, in 1892. But in these regions ordinary citizens generally did not use weapons to settle disputes nor resort to mob violence. The most conspicuous example of mass lawlessness in the northeastern quadrant of the nation was in Pittsburgh during the GREAT STRIKE OF 1877.

In contrast, the South retained its antebellum reputation as the most violent section of the country. Duels were no longer fashionable, but males carried arms and were quick to use them. Fatal quarrels arose over such petty issues as opening a door. The spectacular West Virginia feud between the Hatfields and McCoys began over an allegedly stolen pig. In 1890, Massachusetts, with immigrants and large cities, reported only 16 homicides, while many less populated southern states reported more: Virginia, 65; North Carolina, 69; Kentucky, 88; Georgia, 92; and Tennessee, 115. Neither AFRICAN AMERICANS nor poor whites were disproportionately responsible for these killings. Murders were committed by planters, lawyers, doctors, bankers, and even preachers. Although race was involved in some homicides, in most instances whites killed whites.

The milieu of violence among white southerners, perhaps stemming from their Celtic cultural background, existed prior to the Civil War and Reconstruction and was easily transformed into the race violence of the Gilded Age. LYNCHINGS of blacks and murderous riots to achieve white supremacy at points from Hamburg, South Carolina, in 1876 to Wilmington, North Carolina, in 1898, were deeds in keeping with a homicidal society. Violence in defense of one's honor or the community's prejudices was socially acceptable.

Racially inspired lynchings were also common in California, which took generations to outgrow the lawlessness of a mining frontier. Out of 352 victims of mob killing from 1850 to 1935, 132 were Hispanics, more than a third; 41 were NATIVE AMERICANS; 29 were Chinese; and eight were African Americans, all of whom were disproportionately represented.

The Civil War and Reconstruction spawned both violence in Missouri and an outlaw folk hero in Jesse James.

After marauding with lawless pro-Confederate guerrillas in Missouri, James and his brother Frank began robbing banks in 1866 and three years later were identified as suspects in a bank robbery in Gallatin, Missouri. Shrewdly recognizing the power of public opinion, James commenced creating his legend with a public letter proclaiming his innocence and accusing Radical Republicans of persecuting him for his Confederate service. Over the next 10 years James and his brother Frank, joined by Cole Younger and his brothers (who were also guerrilla veterans), robbed banks and railroads, cultivating in the press and among Democratic politicians a Robin Hood image. With banks and RAILROADS unpopular in the depression year of 1875, the image was so persuasive that Democratic legislators almost passed an amnesty resolution for James and his gang. A botched bank robbery in Northfield, Minnesota, severely strained the Robin Hood myth and kept the resolution from passing the next year. Not only were a bank cashier and three robbers killed, but three of the Younger brothers were wounded and captured. Two robbers, presumed to be Jesse and Frank James, escaped. Without the Youngers, James recruited less able criminals, and his robberies became more violent. With a price on his head James was assassinated in 1882 by members of

Jesse James, 1864 (*Library of Congress*)

his own gang, but the Robin Hood myth did not die with him. For many, James, a habitual criminal, has come to represent a justice higher than law.

Like Jesse James, Billy the Kid has become a legend, with movies and even a ballet about him. In 1877, when he was 17, he killed a bully who had tormented him and became an outlaw. The next year he participated in New Mexico's Lincoln County War. To break the monopoly a company had on Lincoln County's business by its lucrative federal contracts to supply Fort Stanton and the Mes-calero Apache Reservation, a competing firm hired Billy the Kid and other gunmen as paramilitary "Regulators." They fought battles with the entrenched company, with the Kid participating in the ambush murder of Sheriff William Brady and the killing of Buckshot Roberts in a shoot-out. The war ended when a sheriff's posse surrounded the Regulators in their employer's house, burned them out, and killed four of them, while the Kid and three others escaped. His negotiations with New Mexico's governor, LEW WALLACE, to earn amnesty by turning states evidence fell through, because he was rustling cattle in Texas. In 1880 he was captured by Sheriff Pat Garrett's posse, convicted of murder, and sentenced to be hanged. He escaped the next year by killing two guards and was hidden by Hispanics (especially sheepmen), among whom he was popular because he spoke Spanish, treated them as equals, and stole from Texas cattlemen, who threatened their landholdings. Three months later Garrett caught up with the Kid, fired first, and killed him. In folklore two Billy the Kids live on. The first was the merciless gunman, who killed 21 men (grossly exaggerated to arrive at one for each year of his life), and the second, like Jesse James, was the young Robin Hood who fought for the poor. "For millions," Robert M. Utley observes, "Billy still rides as the ultimate symbol of the violence of the Old West."

Ironically, genuine Robin Hoods did exist in the New Mexico Territory. Texas cattlemen in the 1870s and 1880s began moving into the eastern grasslands of New Mexico and displacing Hispanic sheepmen. Range wars, characterized by extreme racial violence, broke out. There was a rise in the number of Hispanic bandits, but most were not defenders of the Mexican community. Las Gorras Blancas (the White Caps), however, were closer to Robin Hood than were either Jesse James or Billy the Kid. A secret Hispanic organization, its greatest strength in members was in northeastern New Mexico. The White Caps arose in the 1880s and 1890s to protect land owned by Mexicans from the encroachment of Anglos, especially those from Texas. The White Caps harassed white intruders by cutting their BARBED WIRE and burning their buildings. The White Caps' defense of Hispanics won them widespread support in New Mexico and a place in local folklore, but not the renown of Jesse James or Billy the Kid.

### Virginus affair (1873)

The *Virginus* was a former Confederate blockade runner owned by Cubans that was carrying guns, ammunition, and men to the Cuban insurrectionists, who had been fighting their Spanish masters since 1868. On October 31, 1873, while illegally flying the American flag, it was spotted near CUBA by the Spanish warship *Tornado* (also a former Confederate blockade-runner) and was chased within six miles of Jamaica, where it was captured and towed to Santiago, Cuba.

General Juan Burriel, the governor of Santiago, called an immediate court-martial that convicted the crew of piracy and sentenced all of the passengers and crew to death. On November 4, four of the crew were shot and decapitated, and their heads were placed on pikes. Spaniards on the island celebrated the event with torchlit parades. When the shaky republican government in Madrid learned of the sentencing of the crew, the president Emilio Castelar ordered the executions stayed pending government review, but a

break in the telegraph lines prevented Madrid's wishes from reaching Santiago.

Within a few days a total of 53 men (eight of them were American citizens) had been put to death, and the executions were only stopped by the timely arrival of the British warship *Niobe*. Despite the questionable right of the *Virginus* to fly the stars and stripes, Americans were outraged by the insult to the flag and by the sadistic butchery of Burriel and his men. Secretary of State Hamilton Fish instructed the American minister to Spain to demand the return of the ship, its remaining crew and passengers, the payment of an indemnity, and the punishment of Burriel. If these demands were not met, the minister was to break off diplomatic relations and return to the United States.

The Spanish government was in a precarious position in 1873. Having recently overthrown the monarchy, the new Spanish republic still faced a large, powerful bloc of "Carlist" reactionaries and needed to cultivate its popularity. President Emilio Castelar was therefore hesitant to apologize for Burriel's actions because the severe treatment of the *Virginus*'s crew was widely supported by Spaniards at home and in Cuba. But after delaying a few days, the Spanish government suggested that negotiations for a settlement be transferred to Washington and pledged to comply with the principles of international law. The Spanish minister Admiral Don José Polo was able and conciliatory and, with Fish, worked out an arrangement agreeable to both Madrid and Washington. Basically Spain gave in and released the *Virginus*, including surviving passengers and crew, and paid an indemnity of \$80,000. Spain, however, delayed bringing charges against Burriel. As Spanish procrastination entered its fourth year, the general died.

**Walcott, Charles Doolittle** (1850–1927)

*paleontologist, geologist*

Charles D. Walcott was born on March 31, 1850, in New York Mills, near Utica, New York. He started collecting minerals at the age of 13 and at 17 resolved to study the Cambrian system of older (more than 500 million years) fossiliferous rocks of North America. Walcott's formal education ended when, in 1868, he left Utica Academy to work in a hardware store, but his interest in Paleozoic fossils remained strong. Rather than enter a lucrative partnership in 1871, he found and studied fossils on the farm of William P. Rust at nearby Trenton Falls (where he had searched for them as a teenager). The next year he married Rust's daughter Lura, with whom he had no children. With Rust's help Walcott amassed an impressive collection of fossils, especially of trilobites (three-lobed marine arthropods or invertebrates) that attracted the attention of James Hall of the New York Geological Survey and of Louis Agassiz of Harvard. After Harvard purchased the collection in 1873 for \$5,000, Walcott arranged to study with Agassiz, whose death in December led Walcott to change his plans. The November following Lura's death in early 1876, Walcott became a special assistant to Hall and continued his work "to determine the structure of the trilobite." In 1879 he published a pioneering study of trilobite legs. His work later led to the recognition that trilobites were distinct from crustaceans, although they were related to them.

Upon Hall's recommendation, CLARENCE KING, head of the newly established U.S. GEOLOGICAL SURVEY (USGS), appointed Walcott a temporary geologist in 1879. Ordered to the Grand Canyon region, Walcott's thorough work was both geological and paleontological. For example, while there, he determined the boundary between Permian and Triassic strata and identified the fossils collected. Although King's successor, JOHN WESLEY POWELL, said

Walcott's 1882 work on post-Cambrian strata in the Grand Canyon, involving risky climbs, resulted in "discoveries of the highest interest and value," Walcott, who contributed to both sciences, was more interested in paleontology than in the closely related field of geology. In 1883 he was promoted to the position of paleontologist of the USGS, and in 1884 the USGS published his *Paleontology of the Eureka District*, a standard reference based on 359 fossils he collected in central Nevada. In the mid-1880s he studied Cambrian rocks in northeastern New York and western Vermont and determined that what was called the "Taconic system" was not a uniform system, but a jumble of Cambrian and younger rocks. As a result of his work geologists ceased after 1888 to use the term *Taconic system*.

On June 22, 1888, Walcott married Helena Burrows Stevens; they had four children. Walcott and his new bride began their honeymoon in Newfoundland, where Walcott collected additional evidence on Cambrian trilobites. They next departed directly for England, where Walcott attended the 1888 International Congress of Geologists at London. There Walcott secured an international reputation for his work on the so-called Taconic system and for his discovery of the correct sequence of trilobites. On the basis of that sequence Walcott subdivided the Cambrian system in the United States into Lower Cambrian (with the fewest outcrops), Middle Cambrian, and Upper Cambrian (with the most outcrops) and determined where land and sea were in the Cambrian period. Walcott's stratigraphy has not been altered substantially by subsequent research.

The growing reputation of Walcott led to his promotions in the USGS, culminating with his selection, by President GROVER CLEVELAND, as its head in 1894. Powell, his predecessor, had resigned after his salary and USGS appropriations were slashed because he had incensed Congress with his emphasis on basic geological research, rather than on studies of mineral resources. The scientific community applauded the selection of Walcott, who proved to be an excellent administrator. He regained the confidence of

Congress, and between 1894 and 1907, when he resigned, the USGS budget more than tripled. Walcott also retained the confidence and friendship of his staff. He combined political savvy with a devotion to science and the USGS that gained the respect of all. Appropriations increased because Congress was pleased by Walcott's willingness to undertake practical tasks relating to mining, irrigation, and forests. The USGS investigated surface and underground waters and moved to preserve forests at the sources of rivers. In 1897 the USGS began to administer U.S. forest reserves and, to promote conservation, proceeded to map and classify them as wooded, arable, and pasture. In 1905 these functions were transferred to the newly established U.S. Forest Service. Under Walcott experiments on coal combustion in the USGS led in 1910 to a separate Bureau of Mines. Having met the congressional demand for practical results, the USGS under Walcott was also able to continue the basic research Powell had stressed.

In 1907 Walcott left the USGS to head the Smithsonian Institution as its secretary until his death. Along with administering its museum and the Zoological Park, he was a prime mover in the founding of the Freer Gallery. During this period two of his sons died, and in 1911 his wife, Helen, died in a railroad accident. On June 30, 1914, he married an artist, Mary Vaux; they had no children.

Walcott's main reason for leaving the USGS was to find more time for fieldwork and writing. But because he was a good organizer and administrator, he also served on committees, councils, and boards of trustees. For example, he participated in the establishment of the Carnegie Institution and was on its board of trustees until he died. He was an officer of the National Academy of Sciences from 1899 to 1923, serving as president from 1917 to 1923. In addition to these responsibilities, he was able to investigate Cambrian outcrops in the Canadian Rockies, and in 1909 in the Middle Cambrian Burgess shale of British Columbia, he found trilobites with their appendages preserved and many fossils of previously unknown soft-bodied animals. Among his many publications the monumental two-volume *Cambrian Brachiopoda* (1912) stands out. Walcott died on February 9, 1927.

**Wallace, Lew** (1827–1904) *novelist, lawyer, politician, soldier*

Soldier, author, and incurable romantic, Lewis (he preferred Lew) Wallace was born on April 10, 1827, in Brookville, Indiana. An avid reader of romantic novels and history, he was often truant from school, preferring to wander in the

General Lew Wallace, ca. 1860 (Library of Congress)

woods with a gun on his shoulder and a book under his arm. He was a talented artist, whose blackboard caricature of his teacher with the body of a rabbit earned him a bloody beating. Whipped by his father, as well as his teachers, Wallace remained undisciplined, careless, and unkempt in appearance. When his father, David Wallace, was elected governor of Indiana in 1837, Wallace appreciated the State House library, especially picture books and the novels of James Fenimore Cooper. After Wallace ran off for 12 days to attend a rally for the 1840 Whig presidential candidate William Henry Harrison, his father sent him to Samuel K. Hoshour's school in Centreville. A gifted teacher, Hoshour recognized Wallace's needs and ability and inspired him to use simple, clear prose to express his romantic craving for adventure.

Upon his return to Indianapolis in 1841, Wallace, although only 14, joined the Union Literary Society. On Friday evenings members read and criticized compositions and discussed issues, and Wallace wrote a derring-do novel set in the 10th century. When two years later Wallace and a friend, hoping to join the Texas navy in the Gulf of Mexico, got 10 miles downriver in a skiff, Wallace's father stopped paying for his education.

Wallace worked with the county clerk, copying documents and creating a legal record from brief scribbled

notes. To achieve his dream of becoming a novelist, he mastered grammar in a rigorous program of self-education. Simultaneously, Wallace found in William Hickling Prescott's *Conquest of Mexico* (1843) the setting for his novel *The Fair God*. He learned Spanish to read Prescott's sources and began to study law in his father's office.

When the Mexican-American War came in 1846, Wallace raised a company, of which he became lieutenant, and joyfully went off to the land of Moctezuma and Hernán Cortes. He saw little action and still thought of "war as a path of glory," even though he saw much after-battle carnage and many corpses, resulting from disease. When the Whig Party nominated General Zachary Taylor, who had criticized Indiana troops, for president in 1848, Wallace left the party, edited a Free Soil paper to oppose him, and ran up a personal debt of \$600. Admitted to the bar in 1849, Wallace by 1852 had earned enough money to marry Susan Arnold Elston; they had one child. In that year Wallace was elected state prosecuting attorney as a Democrat, but by 1856 he had joined what became the Republican Party and was elected a state senator. With the deepening sectional crisis in the late 1850s, Wallace organized a Zouave company, noted for its drill and colorful uniforms.

When the Civil War came in 1861, Wallace advanced from colonel of a regiment to major general by March 1862, having participated in ULYSSES S. GRANT's army at the capture of Fort Donelson. He was criticized for his delay at the Battle of Shiloh (April 6–7, 1862), but he successfully defended Cincinnati and Washington from Confederate raiders. Wallace participated in the courts-martial of those involved in Abraham Lincoln's assassination and of Henry Wirtz, the commandant of Andersonville Prison (the first war crimes trial).

At the war's end, Wallace was still in pursuit of glory and a fortune. He supported the republican forces in Mexico under Benito Juárez, who was trying to rid Mexico of French troops and Emperor Maximilian. Wallace was commissioned a major general in Juárez's army, raised troops in Indiana, Illinois, and Tennessee, and incurred \$25,000 in debts shipping arms and munitions to the republican forces. He was not reimbursed nor did his hope to colonize and exploit the neglected silver mines of northern Chihuahua materialize.

Returning to Crawfordsville, Indiana, Wallace practiced law to defray his enormous debt and returned to the novel he had worked on intermittently since 1843. Published in 1873, *The Fair God* uniquely viewed the conquest of Mexico from the perspective of the vanquished Aztecs. It sold well, established Wallace as a literary as well as a military man, and inspired him to start a novel set in the ancient Roman Empire. During the disputed 1876 election, Wallace, who had remained a loyal Republican, visited Florida at RUTHERFORD B. HAYES's request and

concluded that though both sides were unconscionable, Hayes deserved Florida's electoral votes. In 1878 Wallace got out of the "intolerable old rut" of law practice, when he was awarded the governorship of the New Mexico Territory. There he dealt successfully with the Lincoln County War (see VIOLENCE AND LAWLESSNESS) and with Apache hostilities.

While living in Santa Fe, New Mexico, Wallace completed *Ben-Hur* (1880), a best-selling novel (more than 2 million copies) and the subject of three popular motion pictures. Although it is about Jesus Christ, Ben-Hur is its hero. He represents Jewish culture and its faith in a Messiah and ultimately converts to Christianity, while Messala, his friend turned enemy, represents Roman politics. Among adventurous episodes the chariot race between Ben-Hur and Messala is most famous.

After *Ben-Hur*, Wallace continued to write. While minister to Turkey (1881–85), he gathered material for another novel in an exotic setting, *The Prince of India* (1893). He also produced the readable *Lew Wallace: An Autobiography* (1906), which his talented wife, the author of *The Land of the Pueblos* (1888), completed. Wallace died in Crawfordsville on May 20, 1904.

### Wanamaker, John (1838–1922) *businessman*

An innovative merchant and U.S. postmaster general, John Wanamaker was born on July 11, 1838, in the Gray's Ferry area of present-day Philadelphia. After only three years of schooling he held a series of jobs, ending as a salesman in Tower Hall, Philadelphia's leading clothing store. Suffering from overwork, Wanamaker in 1857 regained his strength on a trip to Minnesota.

Returning to Philadelphia in 1858, Wanamaker started what turned out to be an auxiliary career. He became the first full-time, paid secretary of the Young Men's Christian Association (YMCA) in Philadelphia, earning \$1,000 a year. He multiplied its membership in that year from 57 to more than 2,000 men. Under his leadership the YMCA distributed New Testaments, trained Sunday school teachers, and promoted temperance. The following year he established the Bethany Sunday School (Presbyterian), which became the largest Sunday school in the United States.

In 1860 Wanamaker married Mary Erringer Brown. They had six children. In April 1861, with Mary's brother, he opened Oak Hall, a clothing store that lured customers with unheard of sales events and kept them satisfied with gracious service. In 10 years it became the largest clothing store for men and boys in the country. In 1869, Mary's

brother having died the year before, Wanamaker, while continuing Oak Hall, opened John Wanamaker & Co., an upscale men's store, with a policy of cash only, lower prices, and guaranteed satisfaction. Riding the crest of success, Wanamaker in late 1875 purchased from the Pennsylvania Railroad for \$500,000 a huge old freight depot. Before opening it in May 1876 as the Grand Depot Store, he let DWIGHT LYMAN MOODY hold revival meetings in it free of charge for two months. With 8 million people attending the PHILADELPHIA CENTENNIAL EXPOSITION that year, Wanamaker's enormous store was a great success. Anticipating a loss of customers when the fair closed, Wanamaker added women's clothing to his line of wear and in 1877 devoted a large area of his store to the sale of dry goods. In 1877 he had a cash flow problem, but by appealing to the whole family and pioneering the DEPARTMENT STORE, he survived and prospered. By 1884 the Grand Depot was the largest store in the United States, with 50,000 daily customers served by 3,000 employees.

Wanamaker was probably the greatest innovator among 19th-century American retailers. His store was the first to have electric lights and the first to have a restaurant. And he was a genius at ADVERTISING. He was the first to use full-page newspaper ads, and he even released 20-foot hot-air balloons, promising a free suit to whoever found and returned a balloon.

Wanamaker continued to expand. In 1896 he acquired the A. T. Stewart store in New York City, and in 1911 he built, in Philadelphia, the "largest retail institution in the world." In it he installed a great organ, still functioning today, and invited the public to free organ and choral concerts. To a large extent Wanamaker's success was due to his ability to surround himself with able and loyal lieutenants and workers. He provided them with educational opportunities, an insurance program with reasonable rates, a summer camp with two-week vacations for their children, and a hotel for women employees.

A partisan Republican, Wanamaker gave \$10,000 to MATTHEW STANLEY QUAY's successful presidential campaign for BENJAMIN HARRISON, who appointed him postmaster general. Wanamaker increased the efficiency and service of the Post Office Department but incurred the wrath of CIVIL SERVICE REFORMERS by replacing Democratic postmasters with Republican ones. Willing to introduce services that did not pay for themselves, he proposed rural free delivery, parcel post, and postal savings systems, which were later enacted. He also proposed unsuccessfully the nationalization of telegraph and telephone systems under the control of the Post Office Department. He extended mail service, established sea post offices to sort mail en route, and utilized pneumatic tubes to speed mail within cities. Wanamaker, Wayne Fuller declares, "was an expert administrator and made more improvements in

the postal service than perhaps any other postmaster general" except possibly Montgomery Blair, who served in the administration of Abraham Lincoln. With his political ambitions awakened, Wanamaker opposed the Quay machine and ran for the U.S. Senate in 1896 but was defeated by Quay's candidate, Boies Penrose.

Despite his business interests, public service, and political ambitions, Wanamaker continued his lay religious activities for the YMCA and the Presbyterian Church until his death on December 12, 1922.

### Ward, Lester Frank (1841–1913) *sociologist*

A founder of modern American sociology, Lester Frank Ward was born on June 18, 1841, in Joliet, Illinois. His father was an itinerant mechanic in the small farming and commercial communities that 20 years earlier had been on the frontier. Following a common-school EDUCATION, Ward worked as a laborer but read widely, studying French, German, and Latin on his own. During the Civil War he served in the Union army, was wounded at Chancellorsville in 1863, and in 1865 secured a position in the Treasury Department at Washington. There he went to evening school and by 1872 he had earned diplomas in law, medicine, and the liberal arts from Columbian College (now George Washington University). During this time he began writing *Dynamic Sociology*, which was published in 1883 and established Ward's scholarly reputation. Ward continued his federal civil service career in the U.S. Geological Survey as chief of the Division of Fossil Plants until 1906. In that year he became the first president of the American Sociological Association, joined the faculty of Brown University, and taught there until his death on April 18, 1913.

Disagreeing with the laissez-faire ideas of WILLIAM GRAHAM SUMNER, Ward believed that the state when guided by SCIENCE could be a powerful means for improving society. He called for "sociocracy," which would give the state a major role in national economic and social planning. The progressive legislation in many states between 1900 and 1920 as well as the New Deal legislation of the 1930s can be traced to his ideas. Ward argued that people through their mental powers could be the subject or creator and not the object of social processes. Acting together, individuals could create citizen communities, identify problems, gather data, and apply cooperative planning to solve social and economic problems. Confronting laissez-faire advocates, Ward pointed to the successful English

and French government interventions in transportation and communication systems. He maintained that under an absolute monarchy laissez-faire did make sense, since strict state control severed individuals from one another. In a democracy, however, people could freely associate, unite, plan, and prosper within their own self-created state. Humans had the intellectual capacity to consciously control evolution and to progress. People were not purposeless animals forced to engage in cutthroat competition to survive life's struggles but rather were capable of planning to master nature and the environment. Uncontrolled competition only led to disaster. Modern societies needed planning and "superior systems."

With his stress on intellectual capacity to plan improvements for society, Ward emphasized the role of education, believing it to be the key to progress and the healing of social ills. It only made common sense to educate all children—male and female, rich and poor—to their fullest capacity and that society should bear its costs. As children, the republic's future citizens would learn the need for cooperative planning and scientific methods.

Ward was not a socialist, and while advocating equal opportunity, he did not require equal outcomes. He was an ethical evolutionist who believed that the state should be guided by specialists using scientific planning methods. In his view, education was the nucleus around which individual and social interests could revolve and resolve themselves in harmony.

**Washington, Booker T.** (1856–1915) *educator, founder of Tuskegee University*

Booker Taliaferro Washington, educator and African-American leader, was born a slave April 5, 1856, on James Burroughs's plantation near Hale's Ford, Virginia. His mother was Jane Ferguson, Burroughs's slave cook, but Washington never knew the identity of his white father, who he believed came from a neighboring plantation. After their emancipation in 1865, Washington, his mother, stepfather Washington Ferguson, half brother John, and half sister Amanda moved to Malden, West Virginia. After working hard in a coal mine, Booker became a houseboy for the wife of the mine owner, Viola Ruffner, who tutored the ambitious boy.

Washington was able as well as ambitious. He attended and excelled at Hampton Institute in Virginia from 1872 to 1875. The institute's founder, General Samuel Armstrong,

instilled in the impressionable Washington a work ethic and a belief in an educational program for AFRICAN AMERICANS that combined utilitarian skills like agriculture and carpentry with character building. Washington returned to Malden and taught for three years, then studied theology for a few months before deciding that the ministry was not for him. In 1879 he was called back to Hampton Institute by Armstrong to run its night school.

Two years later in 1881 Armstrong strongly recommended Washington to Alabama commissioners of education who were looking for a white principal for an African-American normal school to be established at Tuskegee. They appointed Washington, but he discovered that he had to start a school with only \$2,000 and no land or buildings. Working enormously hard and using great tact, Washington secured support from local whites, recruited students, and held Tuskegee's first classes in a shanty. From that rude beginning he built a school that at the time of his death in 1915 boasted a campus of 100 buildings on 2,000 acres, an all-black faculty of almost 200 (including the distinguished

Booker T. Washington (Library of Congress)

botanist GEORGE WASHINGTON CARVER), and 1,500 students. Washington was able to develop Tuskegee Institute into a major industrial education school in large part because he skillfully attracted the financial support of America's leading industrialists and philanthropists, such as ANDREW CARNEGIE, John D. Rockefeller, and GEORGE EASTMAN. Tuskegee, however, was not strictly a vocational school; students also studied composition, history, and mathematics and attended daily chapel services aimed at character building.

Washington married Fanny Norton Smith, a graduate of Hampton Institute, in 1882, but she died two years later from injuries suffered in a fall from a wagon. In 1885 he married Olivia A. Davidson, a graduate of Hampton and the Framingham State Normal School in Massachusetts, who died in 1889. His third wife, whom he married in 1893, was Margaret J. Murray, a Fisk University graduate and a leader of the NATIONAL ASSOCIATION OF COLORED WOMEN's Clubs and of the Southern Federation of Colored Women's Clubs.

It was Washington's prominence as an educator that led to his rise as a race leader. The death of Frederick Douglass in February 1895 left a void in national black leadership, and Washington was chosen to speak at the Atlanta Cotton Exposition in late 1895. As he noted in his autobiography, *Up from Slavery* (1901), Washington knew that his words would be carefully monitored for their impact on race relations. His bold call upon whites and blacks to coexist is referred to as the Atlanta compromise. "In all things that are purely social we can be as separate as the fingers, yet one as the hand in all things essential to mutual progress" were the words that cemented his relationship with conservative white America. Washington thought that rather than agitate for civil and political rights, African Americans must first gain the respect of whites by becoming educated, working hard, practicing thrift, acquiring land, and establishing businesses. In 1900 Washington established the National Negro Business League to assist blacks in becoming more economically independent.

Washington's reputation as a successful educator and racial healer earned him the respect and admiration of white Americans, who regarded him as the spokesman of black Americans. Andrew Carnegie extravagantly praised him as "the combined Moses and Joshua of his people." But Washington was also a power broker who instilled both fear and envy in his black critics. President Theodore Roosevelt cleared his appointments of blacks with Washington, and philanthropists counseled with him before giving donations to black institutions of learning. Washington's secret control or influence over newspapers such as the *New York Age* and the *Washington Bee* helped him in his attempts to silence critics. Additionally, his network of spies and informers kept him apprised of what his critics were up to and placed them at a severe disadvantage.

Progressive African Americans and their supporters severely criticized Washington's "accommodationist" approach, his power, and his tactics. In 1903 W. E. B. DuBois wrote "Of Mr. Booker T. Washington and Others," published in DuBois's *The Souls of Black Folk*, which helped to galvanize opposition to Washington's leadership. In 1908 a race riot in Springfield, Illinois, also alarmed white progressives who feared the spread of racism in the North. Mary White Ovington and Oswald Garrison Villard, liberal supporters of DuBois, helped organize the National Association for the Advancement of Colored People (NAACP) because they believed that Washington's accommodationism had resulted in JIM CROW LAWS and disfranchisement and had not resulted in racial harmony or justice.

Despite the accommodationist label, Washington worked for the civil and political rights of African Americans. He secretly provided money to finance suits that challenged discrimination against blacks in voting rights, in jury selection, and in segregated facilities. This facet of his life, however, remained unknown until years after his death. And even though Washington was greatly admired and respected by prominent whites—Harvard bestowed upon him an honorary degree and President Roosevelt in 1901 had him to dinner at the White House—white racists viciously attacked him for seeking social equality. An editorial in the *Memphis Scimitar* proclaimed, "The president of the United States has committed a crime against civilization, and his nigger guest has done his race a wrong which cannot soon be erased." Washington's leadership declined considerably with the election of Woodrow Wilson in 1912, since his Democratic administration ignored African Americans who were staunch Republicans.

Washington, nevertheless, remained a hero among moderates. The *New York Times* noted when he died on November 14, 1915, that "It is doubtful if any American, within the forty years of his active life has rendered to the nation service of greater or more lasting value than his." The *Times* acknowledged that all blacks did not consider Washington to be their leader, but—speaking for most whites—it considered Washington's approach the best for race relations.

### Washington, Treaty of (1871)

The Treaty of Washington arbitrated several contentious issues that had soured relations between Britain, Canada,

and the United States in the mid-19th century. First, there was a dispute over the boundary between the United States and Canada on the West Coast. The Oregon Treaty of 1846 had set the boundary at the middle of the channel separating Vancouver Island from the mainland, but since there was no well-defined channel, sovereignty over the mid-channel San Juan Islands was left in question. There was also the fisheries problem, since Americans had been fishing in Canadian coastal waters for many years, much to that dominion's annoyance. A recent irritant to Anglo-American relations was the American failure to prevent the raids in 1866 and 1870 on Canada perpetrated by Irish-American Fenians in the hopes of instigating an Anglo-American war that would free Ireland from British rule.

The foremost issue, however, was the *Alabama* claims. The question of the recompense for damage done to American shipping during the Civil War by British-built cruisers (the *Alabama* and her sister ships) had poisoned Anglo-American relations since that war's conclusion. Britain had repeatedly rebuffed American demands that it express regrets for its actions and make payment to the United States for shipping losses and the costly pursuit of the commerce raiders. Charles Sumner, chair of the Senate Foreign Relations Committee, said the British owed the Americans not only \$15 million in direct damages but also an additional \$2 billion for prolonging the war two years by its support of the Confederacy. It was obvious that Sumner and like-minded expansionists would accept Canada in lieu of cash.

For years the situation defied settlement, but President Ulysses S. Grant soured on Sumner and gave his moderate secretary of state Hamilton Fish a free hand. Meanwhile, Britain, fearing that neutrals might build cruisers bent on destroying British commerce in a future conflict, was having second thoughts about its dubious neutrality during the Civil War. On May 8, 1871, Britain, with Canada represented among its negotiators, and the United States signed the Treaty of Washington, which stipulated that the *Alabama* claims would be settled by an international arbitration panel that would meet in Geneva. The British expressed regret for the damage done by British-built warships and agreed to rules defining neutral behavior. Both sides agreed to reciprocal fishing rights in American and Canadian territorial waters, with the price of the Canadian rights, which were of greater value, to be determined by a joint commission. It was also agreed that the emperor of Germany, Wilhelm I, would arbitrate the settlement of the San Juan boundary dispute. The treaty passed the Senate on May 24, 1871, by a vote of 50 to 12.

At the commencement of the arbitration panel in Geneva in December 1871, the United States renewed the Sumner claim for indirect damages, inspired some months of war talk, and jeopardized the treaty until cooler heads prevailed and the Americans retreated. On June 19,

1872, the tribunal's president Count Federico Sclopis of Italy announced that the indirect claims were outside the avowed purview of the panel. Getting down to business, on September 14, 1872, the arbitration panel ordered Great Britain to pay the United States \$15.5 million. Later in 1872 the German emperor awarded the San Juan Islands to the United States; in 1873 a commission on the outstanding claims of both the United States and Britain awarded almost \$2 million to the latter; and in 1875 the fisheries commission awarded the British \$5.5 million. Although Canadians, Britons, and Americans all grumbled, all were winners in the most successful arbitration treaty the world had yet witnessed.

**Watterson, Henry** (1840–1921) *journalist, newspaper editor*

Although only five feet tall and weighing 80 pounds in his maturity, Henry Watterson was a larger-than-life editor. He was born in Washington, D.C., on February 16, 1840. Watterson, whose father was a U.S. representative, as a child sat on Andrew Jackson's knee. A frail child whose eyesight was damaged by scarlet fever, Watterson was tutored by his mother until he was 12. He frequented the Capitol and was on the floor of the House and wept when John Quincy Adams, who had often taken him to the Library of Congress, was fatally stricken. From 1852 to 1856 Watterson attended the Academy of the Protestant Episcopal Church in Philadelphia, where for four years he edited the school paper. Fearing he was too frail for college, his parents had him tutored at their McMinnville, Tennessee, home. When his father gave him a printing press in the summer of 1856, he began publishing the *New Era*, a two-page broadside. His first editorial, warning that the election of the Republican John Charles Frémont would dissolve the Union, was reprinted by Democratic papers throughout the East.

In 1858, when he was 18, Watterson went to New York City and worked briefly for the *Tribune* and the *Times*. By the end of the year he was back in Washington, D.C., where his father had influential friends. He was appointed a clerk in the Interior Department, became a reporter for the *Washington States*, and a correspondent for the *Philadelphia Press*. He interviewed John Brown immediately after his raid on Harpers Ferry, ardently supported Stephen A. Douglas for president in 1860, and became his personal friend and stood with him near the new president, when

Abraham Lincoln delivered his inaugural address in March 1861.

The coming of the Civil War in April left Watterson, who was an ardent unionist and hated slavery, in a quandary. Since his father's close friend was Secretary of War Simon Cameron, he explored the possibility of a War Department clerkship but decided to go home to Tennessee to sit out the war. Within a month Watterson joined the Confederate army. His size and eyesight made him an unlikely soldier, and he only served intermittently, often as a staff officer. More often he edited newspapers, such as the *Rebel*, which was aimed at rallying troops and which he edited in Chattanooga from 1862 to 1863. His lively, irreverent, critical style made Watterson popular with soldiers but not necessarily their generals. With the Confederacy collapsing in early 1865, Watterson made his way north to relatives in Cincinnati, Ohio. Through his uncle, Stanley Matthews (a future SUPREME COURT justice), he got a job editing the Cincinnati *Evening Times*, which he rejuvenated.

In September 1865 Watterson returned to the South as coeditor of the Nashville *Republican Banner*; and on December 20 he married Rebecca Ewing. They had five children. Editorially, Watterson pled for sectional reconciliation and for national harmony. He favored the Reconstruction policies of President Andrew Johnson but feared that the resultant election of former Confederate leaders and the enactment of Mississippi's Black Code would play into the hands of Radical Republicans. He preached moderation, welcomed the end of slavery, and thought education more important for AFRICAN AMERICANS than the ballot. He warned them that their best friends were unprejudiced, intelligent, supportive white Southerners, rather than carpetbaggers. When in 1867 Radical Republicans imposed military Reconstruction on the South, Watterson angered white supremacists when he advised them to utilize what rights they had to create good governments.

In 1868 Watterson moved to Louisville, Kentucky, to edit the *Louisville Journal*. By the end of the year he and Walter Haldeman, the proprietor of the *Louisville Courier*, merged their papers to create the *Courier-Journal*, which Watterson edited. His wish was to lead the South in bridging the "bloody chasm" to restore the Union of the 1850s, with its low tariffs, states rights, and the political supremacy of the Democratic Party. To unite Northern and Southern moderates, he attacked Radical Republicans but especially concentrated on unreconstructed rebel Bourbon Democrats, telling them to accept the Reconstruction civil rights and voting rights amendments. He successfully fought for anti-Ku Klux Klan legislation, for the right of blacks to ride on Louisville's street cars, and for the admission of blacks' testimony in Kentucky state courts. Watterson also advocated the development of a "New South" of diversified crops and of RAILROADS and cotton mills, financed by Northern capital.

Watterson's outspoken views achieved a national reputation for the *Courier-Journal* and a place for himself among party leaders. In 1872 he attended the LIBERAL REPUBLICAN convention, dedicated to reunion and reform, and joined the quadrilateral of newspaper editors who thought they could dictate the nomination of Charles Francis Adams. When Horace Greeley was nominated, Watterson supported him for the Democratic nomination, but, despite both nominations, Greeley lost to Ulysses S. Grant. In 1876 Watterson chaired the Democratic National Convention that nominated his ideal candidate, SAMUEL JONES TILDEN, who lost the ensuing disputed election to RUTHERFORD B. HAYES. Having been elected to Congress to serve the remaining six months of a deceased member, Watterson spoke in the House for Tilden during the election dispute. At a rally he also called for a protest march on Washington by 100,000 unarmed citizens. Unfortunately, when JOSEPH PULITZER spoke after him, calling for 100,000 armed men, Watterson was condemned as an irresponsible hothead, rather than Pulitzer.

Watterson rejoiced in 1884, when the Democratic Party finally had a winner in GROVER CLEVELAND. Although Cleveland's commitment to CIVIL SERVICE REFORM irked him, Watterson was pleased in 1888 when Cleveland embraced TARIFF reform. In 1892, however, Watterson tried to prevent Cleveland's nomination. When Watterson, a consistent opponent of inflation, refused to support WILLIAM JENNINGS BRYAN and the FREE SILVER MOVEMENT in 1896, the *Courier-Journal* lost Democratic subscribers. Watterson supported the SPANISH-AMERICAN WAR, thinking it would bring the North and South together and hoping that war's IMPERIALISM would generate international trade, benefiting Kentucky and the South. He reluctantly supported Bryan on his subsequent runs for the presidency and gave Woodrow Wilson only lukewarm support, since he paid little attention to his advice. Watterson vigorously supported American participation in World War I, but in its aftermath opposed the League of Nations and was appalled by the Prohibition and woman suffrage constitutional amendments. He retired in April 1919 and died on December 22, 1921.

## Weather Bureau, U.S.

From time immemorial the weather has been a universal subject of observation and discussion. As head of the Smithsonian Institution, Joseph Henry made meteorology a major concern. In 1849 he received the first weather observations

sent by telegraph in the United States. Henry went on to organize a network of voluntary observers that by 1860 was reporting from 500 stations throughout the nation, but the Civil War seriously handicapped the program. The South was cut off; army observers were withdrawn from the West; and telegraph lines were jammed with war business. After the war, Increase Lapham of Milwaukee, a respected amateur naturalist who had long been a volunteer observer for the Smithsonian, campaigned for a federal storm-warning system and enlisted Wisconsin representative H. E. Paine in the campaign. Paine introduced a bill that won strong support from shippers and other business interests. Colonel Albert J. Myer, chief of the Army Signal Service, persuaded Paine to designate his neglected command as the operating agency, citing its telegraphic network as a major qualification, and CONGRESS adopted Paine's bill on that basis in February 1870.

Joseph Henry cheerfully ceded his volunteer network to Myer, whereupon most of the volunteers dropped out. Myer then turned to civilian meteorologists, notably Lapham and a young astronomer, Cleveland Abbe. Over the next decade the number of stations and the frequency of observations increased substantially under Myer's charge. Forecasts were supplied regularly by telegraph to railroad and weather stations and to the Associated Press. Special warnings of storms and other unusual weather developments were issued to commercial, maritime, and agricultural interests. Myer, now a general, emphasized service over research, to Abbe's private chagrin. Myer, however, showed diplomatic skill in minimizing friction between civilian and military personnel and soothing those who, like Abbe, pined for more research to improve forecasting. As always in meteorology, the inevitable mistaken forecasts brought public complaints, but the overall usefulness of the bureau was generally recognized.

Myer's successor in 1880, General William B. Hazen, proved to be more research-minded, to Abbe's relief. But those who were otherwise-minded resented Hazen, who was also too strict a disciplinarian to suit some. Hazen's tenure was marked by a struggle over the proper degree of Weather Bureau autonomy under the army, and opposition to the cost of the service arose in Congress. Sentiment grew for the transfer of the Weather Bureau to civilian control, and after Hazen's death in 1887, his military successor came around to that idea. The creation of a Department of Agriculture in 1888 offered an administrative home for the bureau, and agricultural interests supported the move. And so it was officially made law as of July 1, 1891.

The bureau's work went on smoothly through the transition to civilian control. The sergeant observers on station were honorably discharged and kept on as civilian employees. Mark Harrington, the new chief, had solid scientific credentials. The bureau was now fully accepted as good

for business and industry, but its course was not uniformly smooth. The depression of the 1890s constrained congressional liberality, and the shift from Republican to Democratic political control in 1893 was reflected in bureau appointments. Harrington feuded with the secretary of agriculture and was removed in 1895. But the bureau weathered these setbacks and began the new century with growing effectiveness and public support.

**Weaver, James B.** See CURRENCY ISSUE.

**Wells-Barnett, Ida Bell** (1862–1931) *journalist, antilynching activist*

Born into slavery in 1862 in Holly Springs, Mississippi, Ida B. Wells-Barnett became a journalist, lecturer, and social activist who fought for African-American civil rights and WOMEN'S RIGHTS. She became one of the most widely known journalists of the late 19th and early 20th centuries and received more press attention than any AFRICAN AMERICAN except Frederick Douglass.

She was born Ida Bell Wells. Encouraged by her father, she attended Rust College (formerly Shaw University, a Freedman's Aid school) during her teen years. At age 16, after yellow fever had killed her parents and baby brother, she took on the care of the five living siblings in the house her father had purchased after the Civil War. She taught primary school and continued to attend Rust between sessions until her dismissal in 1880–81 for what she was later to describe as her "tempestuous, rebellious, hard headed wilfulness." Her determination and fiery spirit were to characterize her life and her tireless work for justice.

Moving to Memphis in 1881, Wells continued teaching conscientiously but without enthusiasm, despite the social status it afforded. A voracious reader, she was beginning to formulate a political sensibility that was to inform her later work. By the end of 1884 she had won two settlements against RAILROADS for failing to honor first-class tickets. Reported initially only in the African-American press, the case was picked up later by white newspapers as well. Legal battles with railroads continued through 1887, although state courts were less supportive than federal courts of the rights of African Americans. The railroads' smear campaign against Wells was not the only time such a tactic would be employed against her.

The legal cases led Wells into journalism. She contributed articles to the *Freeman*, edited by T. Thomas Fortune,

Ida Bell Wells-Barnett (Library of Congress)

and to church publications, including the *American Baptist*, edited by William J. Simmons, who gave Wells her first contract and adequate compensation. She also wrote letters to white-owned publications. In 1888 Wells bought a one-third interest in the Memphis *Free Speech and Headlight*, managed by the Reverend Taylor Nightingale and J. L. Fleming, and eventually became its editor. By 1889 Wells, whose pen name was Iola, was being called the “Princess of the Press.”

In 1892 atrocities in Memphis focused Wells’s career on the elimination of LYNCHING. Three African-American men, owners of a grocery store that competed with a white-owned store, had been arrested on trumped-up charges and held in a jail from which they were seized at 3:00 A.M. by a group of men who brutally killed them. Wells’s fierce editorials set Memphis in turmoil. The threat of physical violence against Fleming (published in white-owned newspapers) and the destruction of the *Free Speech* office convinced Wells to relocate in New York, where she wrote for Fortune’s *New York Age*. Wells was the first to make a connection between the development of successful African-American businesses and the rise of lynching as a form of race terrorism. She countered claims that the rape of white women led to lynching and that lynching was a deterrent,

even suggesting that white women entered into consensual sexual relations with black men.

By 1893 Wells had begun a series of antilynching lectures in New York, Philadelphia, and Boston. She then traveled to England, where she was extremely well received. When she returned she started the Women’s Era Club (1893), the first civic organization for African-American women. She later founded other women’s clubs as well. At the 1893 WORLD’S COLUMBIAN EXPOSITION in Chicago she promoted an antilynching pamphlet she wrote with Frederick Douglass and Ferdinand Barnett of Chicago, who was a prominent African-American attorney and activist. In 1895 she married Barnett; thereafter, she used Wells-Barnett as her surname; edited his paper, the *Chicago Conservator*, and bore four children.

Wells-Barnett joined W. E. B. DuBois in decrying BOOKER T. WASHINGTON’s conservatism and his emphasis on industrial education over higher EDUCATION. In 1910 Barnett founded the Negro Fellowship League to provide lodging, recreation, a reading room, and employment for African-American southern migrants to Chicago. In 1913 she founded the Alpha Suffrage Club, which was the first suffrage organization for African-American women. In the same year, she forced the integration of the American suffrage movement when she refused to march at the back of the National American Woman Suffrage Association’s (NAWSA) march in Washington. After the 1918 race riots in East St. Louis, Missouri, Wells-Barnett went there to find legal aid for African-American victims of the mob violence. In 1919 she warned in the *Chicago Tribune* that similar violence could take place in Chicago. Only a few weeks later almost 40 people were killed in a race riot in Chicago.

Wells-Barnett worked with Jane Addams to prevent the city of Chicago from establishing segregated schools. In 1930 she ran as an unsuccessful independent candidate for Illinois state senator. On March 25, 1931 she died of uremia at the age of 69. She maintained a commitment to racial justice throughout her life as a teacher, journalist, and activist. She was one of the foremost civil rights and women’s rights leaders in American history.

**Whistler, James Abbott McNeill** (1834–1903)  
*painter, printmaker, designer*

Best known as a painter, James Abbott McNeill Whistler was also a printmaker, an interior designer, and a bril-

liant publicist. Most of all, he was a tireless promoter for aestheticism.

The son of a railroad engineer, Whistler was born on July 11, 1834, in Lowell, Massachusetts, but raised partly in Russia and England. Whistler entered the United States Military Academy at West Point, where Robert F. Weir, a distinguished painter, taught him art. Whistler went to Paris in 1856, studying in the Academie Gleyre and becoming friends with many in the French avant-garde. Establishing himself by 1863 in the Chelsea section of London, where he lived until 1892, Whistler became associated with the

Pre-Raphaelites, a group of painters and writers. Whistler attracted attention for his bohemian lifestyle and his prickly personality. In 1877 John Ruskin, the influential art critic, described an exhibition of Whistler's paintings as "flinging a pot of paint in the public's face," and Whistler sued him for libel. Whistler won the lawsuit but was awarded only a farthing in damages. Simultaneously, the White House, his London residence designed in collaboration with architect E. W. Godwin, generated controversy with municipal officials, who demanded changes to the severe facade. Construction overruns coupled with the legal expenses for the

*Arrangement in Gray and Black: Portrait of the Artist's Mother* (1871, Musée du Louvre, Paris), by James McNeill Whistler (Library of Congress)

lawsuit resulted in bankruptcy, and Whistler was forced to sell the house. The artist nonetheless continued to devote a great deal of energy to arranging his own houses, studios, and exhibition spaces, devising unorthodox tone-on-tone color schemes for them. In 1888 he married Beatrice Godwin, widow of the architect, and lived happily with her until her death in 1896. Whistler's youthful milieu became the basis for George du Maurier's *Trilby*, a best-selling novel in the 1890s. Whistler died in London on July 17, 1903, after a long period of ill health that curtailed his work. His wit and his thoughts on art remain accessible through his writings, especially *The Gentle Art of Making Enemies* (1890).

Whistler's art revolved around his interest in refined draftsmanship and elegant color harmonies. Carefully calculated balances of color and form, Whistler's works were entitled "arrangements," "symphonies," or "nocturnes" by the artist to mark their affinity with musical compositions. Whistler's best-known painting is also one that clearly illustrates his theories. *Arrangement in Gray and Black: Portrait of the Artist's Mother* (1871, Musée du Louvre, Paris) depicts an elderly Anna Whistler seen in profile; the composition denies narrative and is rather an exercise in tones of grays and blacks. In Frederick R. Leyland's dining room, where blue and white porcelain was displayed against 17th-century Spanish leather, Whistler painted gold peacocks upon a blue ground, upstaging all the other elements. Completed in 1877 and now known as the Peacock Room, it is preserved in the Freer Gallery in Washington, D.C. Whistler was an important figure in the late 19th-century revival of etching. He developed both outline and subtle cross-hatching techniques, drawing equally upon Japanese prints and 17th-century Dutch engravings. All Whistler's art is marked by a simplicity forged from relentless perfectionism.

**White, Alfred Tredway** (1846–1921) *social reformer*  
An early and great housing reformer, charity worker, and philanthropist, Alfred T. White was born in Brooklyn, New York, on May 28, 1846. After earning an engineering degree from Rensselaer Polytechnic Institute in 1865, he returned to Brooklyn and worked in his family's Manhattan importing firm. Two years later, like his four siblings, White began teaching in the waterfront settlement for immigrant children, started by the young people in Brooklyn's First

Unitarian Church. In 1869 he was asked by his minister to superintend this work. While visiting the homes of sick settlement children, he became aware of their dreadful living conditions and determined to better them. "Well it is to build hospitals for the cure of disease," he said, "but better to build homes which will prevent it."

To help plan the low-income HOUSING he envisioned, White went to England to examine the buildings of Sir Sydney H. Waterlow and other housing reformers. In 1877 White completed his first Brooklyn tenements, the twin, fire-proof, six-story Home Buildings. Each sunlit apartment had its own indoor toilet and front door, off a private balcony. During the next two years he constructed the nearby Tower Buildings, with 170 apartments. In 1890 White completed the nine Riverside Buildings, featuring a total-environment concept far in advance of its time. They had a bathhouse and central yard, including a park, playground, fountain, and music pavilion. White was the first American to prove that good housing rented to workers of limited means could be a profitable investment. "Mr. White never has any trouble with his tenants," the social reformer JACOB A. RIIS stated, "though he gathers in the poorest." His projects, Riis said, "are like a big village of contented people, who live in peace with one another because they have elbowroom."

A few builders in Manhattan, Chicago, and London adopted White's housing innovations. Most builders, who thought only of money, continued building old-time slum tenements (which brought in 18 to 40 percent on their investment, compared to White's 5 percent). To keep these builders from burdening society with the social costs of poor, crowded housing, White lectured and wrote on his housing experiment. He inspired Riis to write his influential book *How the Other Half Lives* (1890) and helped enact the New York State tenement reform legislation of 1895. It stated that buildings could not occupy more than 65 percent of their lots. By 1900 White was a leading member of the New York State Tenement House Commission. Theodore Roosevelt toured Brooklyn slums with him, visited his buildings, and asked his advice on housing reform.

Credited with cutting Brooklyn's infant mortality rates in half, White helped needy children in other ways besides housing. In 1876 he moved the settlement into its own building, the Willow Place Chapel, and started a KINDERGARTEN, which, with student teachers from Pratt Institute, became a model for kindergartens throughout New York City. Settlement programs for children were more than doubled in 1906, when a second building, Columbia House, was added. White further helped immigrant children through the Brooklyn Children's Aid Society, for which he established in 1876 his Sea-Side Home in Coney Island. It was the nation's first facility where slum children received medical attention in a vacation atmosphere. White also was a founder of the Brooklyn Society for the Preven-

tion of Cruelty to Children and in 1878 a cofounder of the Brooklyn Bureau of Charities, which he served for 30 years either as president or secretary. White planned Brooklyn's Wallabout Market in 1893, made the Brooklyn Botanic Garden a reality in 1910, and with Frederic B. Pratt purchased land for Marine Park.

Believing that the children of former slaves needed to be educated as well as immigrant children, White gave generous, multiple grants to both Hampton and Tuskegee Institutes. He brought his progressive ideas to generations of students by endowing a course in social ethics at Harvard, which other colleges soon duplicated.

During World War I White helped feed ravaged towns in Belgium and received the Belgian Order of the Cross for contributing to Herbert Hoover's Commission for Relief there. When he drowned on January 29, 1921, after breaking through thin ice while skating on Forest Lake, near Ramapo Hills, New York, grieving former president William Howard Taft said, "I don't know any other one in all that six millions of New York City who would leave such a void as he does."

**White, Andrew Dickson** (1832–1918) *higher education reformer, diplomat, author*

University president, historian, and diplomat, Andrew Dickson White was born in Homer, New York. His wealthy parents impressed on him that his duty was to help others. After a year at Geneva College, he transferred to Yale, where he graduated in 1853. He spent time in Europe with his friend DANIEL COIT GILMAN, both as an attaché to the U.S. minister to Russia and as a student in France and Germany. Deciding to become a teacher, he returned to the United States and completed an M.A. at Yale in 1857. That same year he became a professor of history and rhetoric at the University of Michigan and married Mary Outwater, his childhood sweetheart. They had three children.

At Michigan, White supported its president, Henry Tappan, who was having problems with state legislators opposed to his plans to create a European-style university. White, who was motivated throughout his career by a desire for public recognition, was already planning a nonsectarian, European-type university for New York State. As the Civil War approached, he lectured against slavery and drilled students for war. During the war he went to England to

lobby against intervention on the side of the South. Upon his return he was elected to the New York state senate (serving 1864–67), which met only three months a year, so he could continue his Michigan teaching.

As chairman of the senate committee on education, which was responsible for allocating funds from the Morrill Land-Grant Act, White could begin carrying out his state-university plans. Helped by Ezra Cornell, another state senator, White succeeded in concentrating the land-grant money on a state university where instruction in agriculture and mechanics would be given. Aided by additional money from Cornell, the university, with Cornell's name and with White as president, opened in 1868. Its blueprint was White's *Report on Organization*, which he presented two years earlier to the board of trustees. That report made him a dominant figure in university education. At his insistence Cornell remained nonsectarian. Not only was it one of the first universities in the country to be coeducational, it also was one of the first to consider science, agriculture, and the mechanical arts as disciplines to be studied in a liberal arts curriculum. White was pleased when other universities used his educational innovations.

White was a pragmatic administrator. To keep the university from being disrupted, White let trustees terminate the tenure of outspoken professors and allowed parents to dictate stricter rules for their daughters than for their sons. When low teaching salaries and Ithaca's cold climate made it difficult to attract desired teachers, White persuaded distinguished "nonresident" professors to deliver one set of lectures a year. Those giving these lectures included zoologist Louis Agassiz, poet James Russell Lowell, and editor George William Curtis.

Believing CHARLES WILLIAM ELIOT's statement, "The surest pledge of long remembrance among men is to build one's self into a university," White remained president of Cornell for 20 years, until 1885. As time went by, however, he took more and more leaves of absence to participate in reform causes and diplomatic endeavors. Hoping to destroy the spoils system, which rotated government workers out of office with each change of political party, White worked for CIVIL SERVICE REFORM. President Ulysses S. Grant appointed White and two other commissioners to make recommendations about the annexation of SANTO DOMINGO. Despite the commissioners' enthusiastic report, the Senate rejected annexation. In 1879 President RUTHERFORD B. HAYES appointed White minister to Germany, where he remained for two years and was very popular. White again resumed that post from 1897 to 1902. In between, he was minister to Russia from 1892 to 1894 and served on the Venezuela Boundary Commission in 1896.

White, who in 1884 became the first president of the American Historical Association, wrote a number of historical works. Best known among them are *A History*

of the *Warfare of Science with Theology in Christendom* (1895), which placed Scripture in an evolutionary context; and *Seven Great Statesmen in the Warfare of Humanity with Unreason* (1910), seven biographies ending with Bismarck, whom White had known during his years in Germany. He also published his two-volume *Autobiography* in 1905.

In 1887 the death of White's wife, Mary Outwater, threw White into a deep depression. He was helped out of it by Helen Magill, the daughter of Swarthmore College's president and the first woman in the United States to earn a Ph.D. Three years later they were married; they had one child. Although Magill gave up her career as a teacher to be White's wife, she was not comfortable with her decision, and the sexism of that period marred their marriage. Nor was their union helped by the pictures of White's first wife gracing every room in their large house.

When family tragedies came, it was hard for White not to view them as a personal affront. The greatest of these were his eldest daughter's addiction to medication and his son's suicide, followed six years later by his grandson's copycat suicide. White, who seemed able to "will away pain and sorrow," had difficulty understanding why his children could not conquer their depression like he had conquered his after his first wife's death. He died at his home in Ithaca, New York.

### **White, Stanford** (1853–1906) *architect*

Stanford White was perhaps the most imaginative design force behind the American Renaissance in the late 19th century. The son of Richard Grant White, music and drama critic, Stanford White was born in New York City on November 9, 1853, and raised among New York's cultured intelligentsia. At age 16, his talents as a draftsman were recognized, and he joined HENRY HOBSON RICHARDSON, helping to oversee the construction of Trinity Church in Boston. Trips to sketch colonial buildings in New England and medieval buildings in the south of France furthered his training. In 1879 White joined Charles Follen McKim and William R. Mead in their New York City architectural office. With his marriage in 1884 to Elizabeth (Bessie) Smith, White cemented his ties to aristocratic New York. The partnership of McKim, Mead & White endured until White's death, and the firm was responsible for many of the country's most prominent public buildings, including Pennsylvania Station and the Boston Public Library. Among the architects trained in the firm were John M. Carrere, Henry Bacon, and Cass Gilbert.

While McKim, Mead & White is best known for its monumental Beaux Arts buildings, the firm worked in many styles, and White was the most protean and prolific designer of the partnership. Although the three interacted on many projects, some of the firm's work can be largely attributed to White. The shingled facades of the Newport Casino in Newport, Rhode Island (1881), a commercial and entertainment complex surrounding a tennis court, were a creative modernization of colonial forms. The Villard Houses in New York City (1885) were five connected stone palazzi with sumptuous interiors reflecting Florentine models. The Gould Library and other academic buildings for New York University's Bronx, New York, campus (1895–1901) referenced a long tradition of great public rotundas, from the Pantheon to Jefferson's library at the University of Virginia. In many of his buildings, White designed, commissioned, or purchased architectural fittings, furniture, rugs, sculpture, and even silverware. He also produced a staggering variety of independent designs, including sculptural settings, yacht cabins, picture frames, jewelry, trophies, and book covers.

White's life was marked by a boundless appetite for work and play. Tall and rotund, with a large mustache and red hair, his associates thought he radiated energy. He was at the center of New York's cultural elite, and he numbered among his closest friends the sculptor AUGUSTUS SAINT-GAUDENS, the editor RICHARD WATSON GILDER, and the painter Thomas Wilmer Dewing. An insatiable collector, frequently going into debt to buy art, he could often be found in New York's most prestigious private clubs (many of which he designed) or at the THEATER. White's death at the roof theater of Madison Square Garden on June 25, 1906, also made him notorious. He was murdered by Harry Thaw, the husband of Evelyn Nesbit, a former chorus girl, artists' model, and lover of White. Thaw's trials and appeals escalated into an indictment of the private lives of New York's artists and permanently scarred White's reputation. The story has been retold often, notably in the film *Girl in the Red Velvet Swing* (1958) and the novel *Ragtime* (1975) by E. L. Doctorow.

### **Wilder, Laura Ingalls** (1867–1957) *children's book writer*

Born Laura Elizabeth Ingalls on February 7, 1867, in Pepin, Wisconsin, the children's book author was the sec-

ond of four daughters of farmers Charles Philip Ingalls and Caroline Lake Quiner. The future Mrs. Wilder grew up at the edge of the “Big Woods” that she was to make famous. Her pioneer family moved often by covered wagon from the log cabin her father had built in Wisconsin to Missouri, Kansas, back to Wisconsin, to Minnesota, to Iowa, back to Minnesota, and finally in 1879 to their permanent home in De Smet, Dakota Territory (now South Dakota). She studied in traditional one-room schoolhouses as the family moved, leaving school at the age of 15 to become a teacher. She married Almanzo Wilder in 1885 and they had a son, who died in infancy, and a daughter.

After a brief time in an unsettled region in Florida, the young family moved to the Ozarks where, in Mansfield, Missouri, the author spent the rest of her life. From 1911 to 1924 she served as home editor of the *Missouri Ruralist* and contributed occasional articles to local and national periodicals. From 1919 to 1927 she was secretary-treasurer of the Mansfield Farm Loan Association. It was not until her early 60s—when her daughter Rose Wilder Lane, a journalist and novelist, persuaded her to set down her recollections of a childhood on the frontier—that Laura Wilder began work on those autobiographical novels that came to be known as the *Little House* series. These nine books vividly recall an earlier, simpler life and have taken their place among the most popular children’s books in American literature, reportedly selling more than 35 million copies by 1994 and winning numerous prizes.

Beginning with *Little House in the Big Woods* (1932), the *Little House* books recount the daily events of a warm, close family and their passage from the raw life of the frontier to the beginnings of an established community. Using the names of her real family but told in the third person, the series captures their individual personalities and details of their lives on the frontier. *Little House on the Prairie*, written three years after *Big Woods*, takes the Ingallses to a new home on Indian lands in Kansas, where they lived until the government ordered them to move on. Other books in the saga chronicle the bitter winter of 1880–81 in De Smet, the childhood of her husband Almanzo Wilder, and the Wilders’ first years of life together. Neither grimly realistic nor sentimental, the series has become a perennial American classic, presenting a richly textured account of the growth of both the heroine and the society in which she lived during the 1870s and 1880s. In simple, direct prose, it reveals both the hardships and the rewards of American pioneer life and the resourceful and courageous spirit that supported it.

**Willard, Frances** (1839–1898) *temperance activist, social reformer*

Although primarily a temperance advocate, Frances Elizabeth Caroline Willard embraced a variety of social reforms. Born in Churchville, New York, on September 18, 1839, Willard grew up on a remote but prosperous Wisconsin farm, where she was tutored by her mother. Willard had little formal education prior to attending Milwaukee Female College for a term in 1857 and then (her parents having moved to Evanston, Illinois) the North Western Female College, from which in 1859 she received her Laureate of Science degree. Willard then taught at a variety of schools, most of which were affiliated with the Methodist Church in Illinois, Pennsylvania, and New York. She had in 1861 agreed to marry Charles Henry Fowler, a Chicago Methodist minister, but the engagement was broken after several months, possibly because he wished to dominate an indomitable woman. Willard, who never married, developed close relationships with other women. In 1868, after nursing her father, who eventually died of tuberculosis, Willard and Kate Jackson, whom she had met while teaching (1866–67) at Genesee Wesleyan Seminary in Lima, New York, embarked on a two-year grand tour financed by Jackson’s father. They visited Egypt, the Holy Land, Turkey, Russia, and western Europe, and Willard attended lectures and studied languages in Rome, Paris, and Berlin. Returning to Evanston, Willard in 1871 was named president of the new Evanston College for Ladies, which was affiliated with both the Methodist Church and Northwestern University. This ideal situation, however, became intolerable when, by a twist of fate, Charles Fowler became president of Northwestern in 1872, asserted his authority, and harassed Willard in petty ways until she resigned in June 1874.

Willard immediately found a new career. In late 1873 and early 1874 praying groups of women, especially in the Midwest, shut down an estimated 3,000 saloons. Shortly after Willard had resigned, a group of women in Chicago organized a temperance society and asked Willard—a well-known educator—to be their leader. A few months later she became secretary of the state organization, and in November 1874 she was in Cleveland for the organization of the Women’s Christian Temperance Union (WCTU) and became its corresponding secretary.

Willard was also a feminist and backed a wide range of social reforms, but the conservative leadership of the WCTU eschewed politics. Using her contacts as secretary and her talents as an orator, Willard fought to secure WCTU backing for woman suffrage and to persuade the leadership to plunge into politics and enable mothers and daughters to shut the “rum-shop beside their homes.”

Frances Willard (*Library of Congress*)

She was diplomatic and nonthreatening as she muted the radical feminism of SUSAN B. ANTHONY and appealed to domestic women by stressing that woman suffrage would protect the home. By 1879 Willard, aided by her secretary and lifelong close friend Anna A. Gordon, had enough followers to be elected president of the WCTU—a position she retained until her death in 1898—and broaden its reform program. She soon reorganized the WCTU by creating departments (39 by 1889) to promote specific reform. For example, in 1880 the WCTU endorsed woman suffrage and in 1882 it created the Department of the Franchise. Other departments reflecting WCTU concerns included Scientific Temperance Instruction and Peace and Arbitration. The WCTU backed the KINDERGARTEN movement, the eight-hour workday, and prison reform, and addressed problems like prostitution, promoted health and hygiene, and advised young mothers. The WCTU entered politics to press for specific reforms on the state level and also, beginning in 1882, to support the PROHIBITION PARTY.

By the 1890s Willard, convinced that poverty was the main cause of intemperance, wished to restructure society. She praised the KNIGHTS OF LABOR in 1886, was influenced by EDWARD BELLAMY's utopian socialist novel *Looking Backward* (1888), began to contribute to the Christian Socialist journal *Dawn* in 1889, and sympathized

with the goals of western Populists (see PEOPLE'S PARTY). She consulted with the Populists hoping they would adopt prohibition and woman suffrage and that the various reform elements she favored would unite in 1892 under one banner. To her great disappointment, the Prohibitionists balked and her plans did not materialize. Divisions over the FREE SILVER MOVEMENT ruined her subsequent attempt in 1895 to unite reformers.

Under Willard's leadership the WCTU had sent temperance missionaries abroad to establish similar organizations, and as a result the World's WCTU organized in 1891 in Boston with Willard as its president. After her failure to unite reformers in 1892, Willard spent most of the remaining six years of her life in England with Isabel Somerset, head of the British Women's Temperance Association, whom she had met in Boston. While in England Willard, not surprisingly, joined the Fabian Society and then preached its version of SOCIALISM at annual conventions of the WCTU, but, surprisingly, Somerset convinced Willard that education would be more effective than prohibition in achieving temperance. Willard's absence and her continuing embrace of social issues caused unease in the WCTU, but she staved off a revolt in 1897. She was, however, in poor health and died in New York City on February 17, 1898. Although the WCTU gradually abandoned the social reforms Willard championed and concentrated on prohibition, under her leadership needed reforms were publicized and some achieved on the state level, and thousands of women were encouraged to demand political equality.

Baker, *Sisters: The Lives of America's Suffragists* (New York: Hill & Wang, 2005); Ruth Bordin, *Frances Willard: A Biography* (Chapel Hill: University of North Carolina Press, 1986); Mary Earhart Dillon, *Frances Willard: From Prayers to Politics* (Chicago: University of Chicago Press, 1944).

**Williams, Fannie Barrier** (1855–1944) *social reformer, lecturer*

Fannie Barrier Williams was born on February 12, 1855, in Brockport, New York. She was the youngest of three children of Anthony J. Barrier, a barber, and his wife, Harriet Prince. She attended local public schools and in 1870 became the first African American to graduate from the State Normal School in Brockport, a teacher's college.

After her graduation Fannie Barrier moved to the South, where schools were founded by reconstructed southern states to educate newly emancipated AFRICAN AMERICANS. She was unable to adjust, however, to the overt racism she found there. "I had missed the training that would have made this continued humiliation possible," she later wrote.

Barrier was admitted to the New England Conservatory of Music, where she studied piano but was asked to leave when southern students threatened to quit if she stayed. At the School of Fine Arts in Washington, D.C., where she also studied, she had to work from behind a screen so the other students did not have contact with her. "I have never quite recovered," Williams wrote years later, "from the shock and pain of my first bitter realization that to be a colored woman is to be discredited, mistrusted, and often meanly hated."

In Washington, where Barrier also worked as a teacher, she met S. Laing Williams, a graduate of Columbian Law School (now George Washington University School of Law). They married in 1887 and moved to Chicago, where he practiced law. In Chicago they both became leaders in the African-American community and were active in social welfare work. In 1891 they were instrumental in establishing Provident Hospital, which had a biracial staff and provided nurse's training for black students, who were barred from other nursing programs.

Williams gained national prominence when she helped lead a successful campaign to represent African Americans in exhibits at the 1893 Chicago World's Fair (WORLD'S COLUMBIAN EXPOSITION). She delivered two well-received addresses at the fair—"The Intellectual Progress of Colored Women in the U.S. Since the Emancipation Proclamation" and "Religious Duty to the Negro"—after which, she became a frequent lecturer at clubs and churches.

In 1894 Williams was nominated to be the first black member of the prestigious Chicago Women's Club. A hostile minority fought her membership for 14 months. She refused to withdraw her name, and in 1895 she was finally voted in by a wide margin.

In her lectures Williams urged black women to organize. In 1893 she was a founder of the National League of Colored Women, and she was very active in the organization that succeeded it, the NATIONAL ASSOCIATION OF COLORED WOMEN, which was founded in 1896. Its local clubs provided services such as child care centers, employment bureaus, and savings banks for the African-American community. She also wrote regularly for three African-American publications, *Women's Era*, *New York Age*, and *Chicago Record-Herald*.

Williams was active in settlement work in Chicago and in 1905 helped found the Frederick Douglass Center, an integrated social settlement. She was one of the first black leaders to identify residential segregation and limited employment opportunities as key areas blocking black advancement. She used her contacts with prominent white citizens of Chicago to lobby employers to hire qualified black women in clerical positions, from which they had traditionally been barred.

"I dare not cease to hope and aspire and believe in human love and justice, but progress is painful and my faith is often strained to the breaking point," Williams wrote in 1904. She was a strong supporter of woman suffrage and was the only African-American woman chosen to eulogize SUSAN B. ANTHONY at the 1907 National American Women's Suffrage Association convention.

When BOOKER T. WASHINGTON was criticized by more militant black leaders for emphasizing vocational education and being willing to accommodate racism, Williams and her husband strongly defended him. But she and her husband were also early and active members of the National Association for the Advancement of Colored People, founded in 1909 by Washington's rival, W. E. B. DuBois. In fact, Williams felt that the work of both Washington and DuBois was needed and saw no contradiction in supporting them both.

Williams's husband died in 1921. In 1924 she became both the first woman and first African American to serve on the Chicago Library Board. At the end of her term on the board in 1926, she retired to Brockport, where she lived with her sister. She died there at age 89.

**Williams, George Washington** (1849–1891) *soldier, pastor, politician, historian*

George Washington Williams was born in Bedford Springs, Pennsylvania, on October 16, 1849, to free blacks Thomas Williams from Virginia and Ellen Rouse of Pennsylvania. He traveled with his parents throughout western Pennsylvania as his father sought steady employment, first as a boatman, then more successfully as a minister and barber. A brief stay in a House of Refuge for unruly teens provided Williams with the only formal education or training he would know until 1864, during the Civil War, when he enlisted in the 6th Massachusetts (Colored) Infantry. Williams participated in the siege of Petersburg, and after the war traveled to Mexico, where he joined the republican forces in their struggle to overthrow Napoleon III's puppet emperor Maximilian. Returning to Pennsylvania in 1867, Williams enlisted in the U.S. regular army, newly open to blacks, and was a BUFFALO SOLDIER in the 10th Cavalry. Williams was rapidly promoted to sergeant major, but a month short of his 19th birthday and after a year of service, he was honorably discharged for gunshot wounds sustained at Fort Arbuckle, Indian Territory.

After leaving the army, Williams briefly served as a Baptist minister in Hannibal, Missouri, but realized he

needed an education. For a few months he studied at Howard University in Washington, D.C., before moving to Newton Theological Institute, a leading Baptist seminary in Massachusetts, where he distinguished himself. Entering the school semiliterate in 1870, he graduated in 1874 an equal to those educated at nearby Harvard. Williams's commencement address was a well-crafted polemic on "Early Christianity in Africa" that foreshadowed the unifying theme of his life, a commitment to a correct representation of AFRICAN AMERICANS and Africans in the media, in history, and in civic life.

A week before graduation, Williams married Sarah Sterrett of Chicago, and three weeks later he was leading a congregation of more than 700 as pastor of Boston's most venerable African-American church, the Twelfth Baptist, renowned for having been a haven for fugitive slaves. Meanwhile, Williams's interest in civic affairs was growing. With Senator Charles Sumner's civil rights bill in jeopardy and with the nation's lack of a viable African-American newspaper since the demise of Frederick Douglass's *New National Era* in 1874, Williams resigned his pastorate after a successful year. He moved with his wife and their only child to Washington, D.C., to found *The Commoner*, a weekly journal devoted to educating blacks and giving them a public voice. Despite the endorsements of Douglass and William Lloyd Garrison, the paper failed after six months for lack of paid subscriptions.

In February 1876 Williams became pastor of Union Baptist Church in Cincinnati, Ohio. Viewing the church as a means to strengthen the black community, Williams offered history lectures to the congregation in addition to his weekly sermons. Williams also wrote articles on African-American issues for Murat Halstead's Cincinnati *Commercial*, a paper with a national reputation, and became a leader in the local Republican Party. In 1877, after Williams unsuccessfully ran for the Ohio state legislature, he secured an appointment in the federal Internal Revenue Service and resigned his church pastorate. Over the next two years, he also studied law under Judge Alfonso Taft, father of President William Howard Taft, and was admitted to the Ohio bar in 1881 and the Massachusetts bar in 1883. He won his second campaign for the legislature in 1879, making him the first African-American member of the Ohio House of Representatives. Serving one term, Williams supported bills to reform police practices, restrict liquor sales, repeal the ban on interracial marriage, and close a black cemetery bordering a wealthy white neighborhood for hygienic purposes. The latter bill stirred controversy when prominent blacks accused Williams of pandering to his white constituency. A solid integrationist, Williams denied the charges, citing health standards as his only motive. During his tenure Williams prevented untold suffering by

exposing the New York Land League's colonization scam, which offered free but uninhabitable land in New Mexico to blacks who wanted to escape the South's oppressive political climate.

By the end of his legislative term, Williams was engaged in full-time historical research. While William Cooper Nell (1816–74) is called America's first black historian, it was Williams who produced the first comprehensive, scholarly work on African-American history. Williams's two-volume *History of the Negro Race from 1619 to 1880: Negroes as Slaves, Soldiers, and as Citizens* (1882–83), published by G. P. Putnam's Sons, and his subsequent *A History of the Negro Troops in the War of Rebellion, 1861–1865* (1887) pioneered in utilizing newspaper sources. These works established Williams, in W. E. B. DuBois's words, "as the foremost historian of his race." With his heightened acclaim, Williams was able to support himself as a professional orator, and he continued to stump for the Republican Party. He worked briefly as a lawyer for the Cape Cod Company in Boston in 1883, and in 1885 he won the recognition of outgoing president CHESTER ARTHUR, who appointed him minister to Haiti, although he was prevented from assuming the post by GROVER CLEVELAND's incoming Democratic administration.

By 1889 Williams was keenly interested in Africa, both for its developmental opportunities and the growing international concern over its still-flourishing illegal slave trade. He interviewed Leopold II, king of Belgium and sovereign of the Congo Free State, for the S. S. McClure news syndicate at the Brussels Antislavery Conference of 1889, deeming him a ruler of "wisdom, mercy, and justice." When Williams visited the Congo the following year on assignment for McClure and with the support of President BENJAMIN HARRISON and the railroad magnate COLLIS P. HUNTINGTON, he encountered human rights atrocities against Africans, routinely administered by Leopold's agents. Determined to end the abuse and expose the false pretences of Leopold's enterprise in the Congo, Williams published *An Open Letter to His Serene Majesty, Leopold II, King of the Belgians*, which was distributed in the United States and Europe. Despite some media attention and the presence of other Western observers in the Congo at the time, it took 10 years for comparable charges to be made by British officials and to be taken seriously. Williams was planning a fuller exposition of what he witnessed in the Congo, as well as a history of the post-Civil War Reconstruction era, when, while returning from Africa, he succumbed to tuberculosis and pleurisy in Blackpool, England, on August 2, 1891. Although in 1890 an Indianapolis newspaper poll voted Williams one of the 10 greatest blacks of all time, his grave in Blackpool was unmarked until 1975, when his biographer, John Hope Franklin, erected a memorial.

**Winnemucca, Sarah** (1844?–1891) *Indian rights activist, interpreter, lecturer*

NATIVE AMERICAN spokeswoman and educator, Sarah Winnemucca was born near Humboldt Lake in western Nevada. She was the daughter of a Paiute chief and was sometimes called a princess. Her maternal grandfather, who was also a chief, arranged for her and her sister Elma to spend more than a year with an English-speaking family, where they learned to read, write, and to sing in English. Their grandfather next had them go to a rancher friend, who enrolled them at the Academy of Notre Dame, a prestigious Catholic boarding school in San Jose, California. Three weeks later, after the parents of their classmates objected to their being at the school, they were sent back to Nevada. There Winnemucca did housework for white families in Virginia City and purchased books to continue her education. In 1866 she began living with her brother Natchez on the Pyramid Lake Reservation, and since she knew five languages, including three Native American ones, army officers from Fort McDermitt frequently asked her to translate and mediate for them. In the 1870s Winnemucca had three marriages of short duration.

In 1875, while living in Oregon with her father at Fort Harney on the Malheur Reservations, she concluded that the army treated Native Americans better than the Office of INDIAN AFFAIRS (Indian Bureau) did. An exception was the new agent for Malheur, Samuel B. Parrish. He worked out a successful agricultural incentive program for his charges and hired Winnemucca as an interpreter and later as a teacher's aide. Unfortunately, he was replaced by William Rinehart, who immediately changed Parrish's policies. When Winnemucca lodged complaints against Rinehart, he fired her and in letters to the Office of Indian Affairs called her a prostitute and a drunkard.

Also disgusted by Rinehart's actions, some Paiute left the reservation to join the Bannock in their war against whites in 1878. Yet other Paiute, including Winnemucca's father, were coerced by the Bannock to join them. Concerned over growing Bannock strength, the army asked for Winnemucca's help. Acting as a scout, she followed Bannock trails for more than 100 miles "through the roughest part of Idaho" into eastern Oregon. There she found her father and his followers, inside the hostile Indian camp, and persuaded several hundred of them to go with her to Fort Lyon. Her actions impressed General Oliver O. Howard, who saw that she received a \$500 reward and hired her as his guide and interpreter.

When the war's end left Winnemucca without a job, she started lecturing in San Francisco and Nevada, calling for Agent Rinehart's resignation and telling of the horrors of reservation life. Dressed in her native dress, almost as if for the stage, and speaking without notes, Winnemucca became an eloquent spokeswoman for the Paiute and other Native Americans. In 1880 she, her father, and her brother were part of a delegation called to Washington, D.C., to discuss the problems of their people. In addition to talking to Interior Secretary CARL SCHURZ in Washington, Winnemucca spoke with President RUTHERFORD B. HAYES and First Lady Lucy Hayes and some of her guests, including Mary Peabody Mann, the widow of the educator Horace Mann. Lucy Hayes was sympathetic and impressed with Winnemucca, and Mary Mann determined to aid her and her cause. Although Schurz gave Winnemucca a letter detailing his promise to allow the Paiute to return to their reservation at Yakima, where adult males were each to receive 160 acres, Indian agents, fearful of provoking white settlers and accustomed to making their own decisions, because of their distance from Washington, did not carry out Schurz's orders.

Back west, Winnemucca accepted General Howard's invitation to teach Native American children at the Vancouver Barracks in Washington State. There she received President and Mrs. Hayes, on their 1880 trip to the West Coast. Impressed by her school and by her eloquent pleas for her people, Lucy Hayes cried as Winnemucca spoke.

Determined to get more than promises, Winnemucca, in 1883, started an eastern lecture tour to plead for Indian rights. She gave nearly 300 lectures in Boston, New York City, Baltimore, Washington, D.C., and other cities. She circulated a petition that was signed by nearly 5,000 people, requesting that Native Americans be given lands in severalty and the rights of citizenship. She was sponsored by Mann, who wrote her into her will, and by Mann's sister ELIZABETH PALMER PEABODY, pioneer in KINDERGARTEN education. Winnemucca's new husband, Lewis H. Hopkins, an Indian Bureau employee, accompanied her. He usually introduced Winnemucca, sat with her on the speaker's platform, and researched at the Boston Athenaeum and the Library of Congress to get background material for the autobiography Mann had urged her to write.

At her lectures Winnemucca, wearing a gold crown and an intricately beaded buckskin dress, spoke from her heart for almost an hour. Peabody, who often sat on the platform with Winnemucca and had heard her lecture 50 times, never grew tired because each lecture was different. Among those who came to hear Winnemucca speak were Edwin Booth, the greatest actor of his era, and HENRY WARD BEECHER, thought by many to be the greatest preacher. Also there were HELEN HUNT JACKSON and Senator Henry L. Dawes, both of whom Winnemucca

inspired to work for Indian rights, Jackson through effective writing and Dawes through legislation.

Besides speaking to better the treatment of her people, Winnemucca was speaking to gain funds for a school she had planned with Peabody. It would be bilingual with Native American teachers and would not tear students away from their homes and culture. Unfortunately, Winnemucca's husband Hopkins had both tuberculosis and a gambling habit, which used up money she was saving for her school as she paid his debts.

Winnemucca's book, *Life among the Paiutes: Their Wrongs and Claims* (1883), which Mann prepared for the press, went through many editions. Winnemucca called her school for Paiute children the Peabody School. It was located near Lovelock, Nevada, on the ranch Leland Stanford, the California railroad builder, had given her brother Natchez. By summer 1885, it had 26 pupils, and it operated successfully for nearly four years. Paradoxically, it had to become an industrial school after the DAWES SEVERALTY ACT of 1887, which turned out very different from the bill Winnemucca had inspired. Unlike Winnemucca's school, which was bilingual so that Paiute children would not forget their own language, Dawes Act schools allowed students neither to live with their families nor to speak their Native American languages.

When she died of tuberculosis at her sister's home in Monida, Montana, on October 16, 1891, Winnemucca was called "the most famous Indian woman of the Pacific Coast." Her name, General Howard declared, "should have a place beside the name of Pocahontas in the history of our country."

### women's colleges

Higher EDUCATION for women in the late 19th century was strongly influenced by the notion of female intellectual inferiority and the conviction that a woman's place was in the home. Curricula for women mixed watered-down academic subjects with studies that would prepare women for domestic life. Oberlin College, the first coeducational as well as multiracial college, admitted women in 1833 but for a "ladies

course" that led to a special degree. The Morrill Land-Grant Act of 1862 increased the virtually nonexistent opportunities for women to gain a college education. By 1870 eight state universities, mostly in the West and Midwest, admitted women, and a dozen or so other colleges were coeducational. In 1900 there were approximately 100 coeducational colleges in the country, and most of the women in college were enrolled in these institutions. Prominent women's rights advocates in 1870 promoted coeducation on egalitarian grounds and, in the case of Elizabeth Cady Stanton, in hopes they would lead to "more congenial marriages." Most coeducational colleges, however, were not as rigorous academically as the older established male colleges or the newly established women's colleges. And although coeducation was egalitarian in theory, it was not in practice. Women often got in through the "side door" and were shunted into elementary education or home economics programs.

Women's colleges, on the other hand—addressing the aspirations and needs of women—were founded or matured in the late 19th century. The "Seven Sisters"—including Mount Holyoke (1836, accredited 1888), Vassar (1861), Wellesley (1870), Smith (1871), Radcliffe (1879), Bryn Mawr (1880), and Barnard (1890)—were soon recognized as superior institutions for the education of women. With Vassar leading the way, they proved that women had the intellectual capacity and the physical strength to tackle rigorous academic subjects—including mathematics and the SCIENCES—without suffering either mental or physical breakdowns or sacrificing their femininity. Their curricula included academic subjects similar to those taught at the best male colleges, physical education to keep up their strength, and ART, MUSIC, and some domestic science, although M. CAREY THOMAS of Bryn Mawr—stressing intellect over femininity—offered no home economics and regarded the care of children as a "most utterly unintellectual task." Living in dormitories and eating and studying together forged strong ties of sisterhood.

In 1870 only 1 percent of college-age Americans were in college, but one-fifth of that small number were women. By 1900 4 percent of those aged 18–21 were in college, and roughly one-third were women. Only about half of all who attended college earned a degree, women were more apt to drop out than men, and in 1900 they comprised only one-fifth of those getting degrees. College graduates did, of course, predominate among those women entering the professions, and they were the driving force in the WOMEN'S RIGHTS movement.

**Further reading:** Roberta Frankfort, *Collegiate Women: Domesticity and Career in Turn of the Century America* (New York: New York University Press, 1977); Mabel Newcomer, *A Century of Higher Education for Women* (New York: Harper & Row, 1959).

## women's rights

By 1870 the women's rights movement had been underway for more than 20 years but had made little progress beyond defining its objectives. Its adherents demanded the vote, full participation in the political process, and women's equality in marriage, including property rights and custody rights. Unless specifically stated in a marriage contract, a woman who married lost her property and much of her legal identity to her spouse, who, as head of the household, was regarded as her protector. Well into the 20th century, an American family traveling abroad would have one passport issued to the husband, and as late as 1922 a woman born in Brooklyn, New York, who married a Dutch immigrant became a subject of the queen of Holland and had to be naturalized to regain her American citizenship. In addition, feminists wanted equal access to education and to the ministerial, medical, and legal professions. There were a few differences in the demands of women. Some more radical feminists like Elizabeth Cady Stanton favored women's equal rights to divorce, while others like ANTOINETTE BROWN BLACKWELL, who was a minister, were loathe to condone divorce and preferred legal separations.

Although women's rights advocates had few differences over objectives, they split in 1869 over tactics and strategy. They had been in the forefront of the struggle against slavery and rejoiced in the passage of the Thirteenth Amendment to the Constitution freeing slaves. But all were dismayed and many were outraged when Radical Republicans ignored voting rights for women in the Fourteenth Amendment and especially in the Fifteenth Amendment (passed CONGRESS in 1869 and adopted in 1870), which extended voting rights to black men. In 1868, to press for the inclusion of women in the Fifteenth Amendment, Stanton and SUSAN B. ANTHONY published a weekly called *The Revolution* (1868–70). When in 1869 the word *sex* was not included in the Fifteenth Amendment, Stanton, Anthony, and their allies established in New York the National Woman Suffrage Association (NWSA); opposed ratification of the Fifteenth Amendment, stressing that white women were far more qualified to vote than recently emancipated black men; and demanded a constitutional amendment that would enfranchise women. The NWSA leadership was radical in thought and tactics. Stanton, its president, not only advocated free divorce but befriended the notorious VICTORIA WOODHULL and would not abandon her even after she publicly endorsed free love. Failing to get immediate redress in a new amendment, the NWSA adopted the aggressive tactic of attempting to vote, since the Fourteenth Amendment did forbid states from denying anyone their rights as citizens. Anthony in 1872 actually convinced election officials in Rochester, New York, to allow her to register, but she was arrested, tried, found guilty, and fined \$100 (which she never paid) when she

voted. In 1875 the SUPREME COURT rejected the NWSA's broad interpretation of the Fourteenth Amendment in *Minor v. Happersett*, ruling that while women were citizens, voting was a privilege, not a right, protected by the DUE PROCESS CLAUSE.

More numerous and less radical suffragists led by LUCY STONE and Blackwell, fearful of imperiling the adoption of the Fifteenth Amendment and losing their abolitionist allies, also in 1869 established the Boston-based American Woman Suffrage Association (AWSA). The AWSA was more conservative on matters of divorce and abhorred Woodhull and free love and included men as members and in responsible positions, but both organizations concentrated on acquiring the vote. The AWSA's main strategy—which made sense after *Minor v. Happersett*—was to organize and secure advances on the state and local levels. Ultimately, local and state campaigns began to pay off as women were allowed to participate first in school board elections and, before 1900, were fully enfranchised in four western states. In part, this success resulted from the support of FRANCES WILLARD, a member of the AWSA, and her huge Women's Christian Temperance Union (WCTU), whose 200,000 members demanded the vote so women could protect the home by destroying the liquor traffic.

In 1890 the NWSA and the AWSA joined and formed the National American Woman Suffrage Association (NAWSA) with Stanton as president and Anthony as vice president. The new organization, however—with its largely middle-class, God-fearing membership and its concentration on state campaigns—was more like Stone's AWSA than Stanton's NWSA. In protest, OLYMPIA BROWN founded the Federal Suffrage Association, but it had little influence. The NAWSA avoided any appearance of radicalism. Indeed, when Stanton, after stepping down as president in 1892, helped produce the *Woman's Bible* (1895) in which the scriptures were shorn of their male chauvinism, the NAWSA repudiated the work. By 1900 the NAWSA had begun to taste success, since male voters after campaigns in Colorado (1893) and Idaho (1896) extended the vote to women. Those states joined Wyoming and Utah, which as territories in 1869 and 1870, respectively, had given women the vote without any pressure from suffrage organizations.

Women's rights advocated in the Gilded Age concentrated on the vote but also fought for equality in education, the law, the workplace, and the professions with limited success. Anthony did help secure in 1860 a New York law giving women equal property rights. It began a trend among states to give wives sole control of their property and earnings. Similarly, the father's common-law right of custody theoretically remained in force in 1900 in the absence of specific state legislation, which was by no means universal. Marriage laws were not uniform, and in many states adultery remained the sole grounds for a divorce.

Women in the late 19th century did have more opportunities in higher EDUCATION with the increase of coeducational institutions (especially state universities) and of WOMEN'S COLLEGES with rigorous curricula. More teaching positions on the primary and secondary levels and secretarial jobs in business opened up for women, but invariably they received less pay for equal work. And women had to surmount enormous obstacles to secure graduate training in the arts and SCIENCES or to gain admission into divinity, medical, or law schools and enter the professions. ELLEN HENRIETTA SWALLOW RICHARDS never rose above the rank of instructor at Massachusetts Institute of Technology (it would not allow her to be a candidate for Ph.D.), although she made distinguished contributions in the field of sanitary chemistry and pioneered the discipline of home economics.

ELIZABETH BLACKWELL, who in 1849 became the first woman doctor in the United States, established in 1868 the Women's Medical College in New York City, which in 1898 merged with Cornell University Medical College, which began to admit women. Women aspiring to be physicians could also attend the Female Medical College of Pennsylvania (established in 1850) and the New England Female Medical College (established 1856), but the number of women physicians remained extremely low in the late 19th century. Elizabeth Blackwell's sister-in-law Antoinette Brown Blackwell became the first American woman minister, and Olympia Brown in 1863 was the first to be ordained with full denominational approval, but entering the ministry remained difficult for women in churches whose polity was congregational and impossible in hierarchical denominations.

The legal profession was perhaps the most difficult to enter. When women, after great difficulty, secured an education in the law, they were still refused admission to the bar because of their sex. MYRA COLBY BRADWELL sued the state of Illinois when she was refused admission to the bar, and the Supreme Court in *Bradwell v. Illinois* (1873) upheld the state by drawing a distinction between a basic civil right, which could not be denied anyone, and the right to practice a profession. The concurring opinion of Justice Joseph P. Bradley cited the "law of the Creator" that "the paramount destiny and mission of woman are to fulfill the noble and benign offices of wife and mother." In that same year, however, BELVA ANN BENNETT MCNALL LOCKWOOD, with the backing of President Ulysses S. Grant, was admitted to the District of Columbia bar. After the Supreme Court in 1876 refused to break tradition and denied her petition to practice before it, she lobbied Congress, and in 1879 it passed a law forcing the Court to reverse itself. Lockwood then became the first woman to be admitted to the Supreme Court bar. Years later, however, when Virginia would not let Lockwood practice in that state because of

her sex, the Supreme Court in *In re Lockwood* (1893) reiterated its stand in *Bradwell* and upheld Virginia. By 1900 women in the law had not really come a long way.

Marilley, *Woman Suffrage and the Origins of Liberal Feminism in the United States, 1820–1920* (Cambridge, Mass.: Harvard University Press, 1996).

### **Woodhull, Victoria** (1838–1927) *political and women's rights activist, publisher*

Victoria Claflin Woodhull—the first woman to run for the United States PRESIDENCY—was born on September 23, 1838, in Homer, Ohio. Her alcoholic father, always in straitened circumstances, moved the family frequently. At age 15, to escape the instability of her home life, Victoria Claflin married Dr. Canning Woodhull, who also turned out to be an alcoholic. After a year or two in Chicago and San Francisco, the couple returned to the Claflin family in Ohio, which by the mid-1850s was being supported by Victoria's younger sister, Tennessee Claflin, who traveled about telling fortunes and selling an elixir she concocted. Woodhull joined Tennessee's traveling medicine show as a spiritual healer—a medical clairvoyant—whose touch could heal. The sisters prospered. Woodhull had two children and divorced her husband in 1865. That same year she married James Harvey Blood who managed her finances, ghosted much of her writings, and involved her in various reform movements.

Audacious and ambitious and accompanied by Blood and assorted Claflins, the sisters came to New York in 1868 expressly to meet CORNELIUS VANDERBILT, the railroad magnate, who was interested in spiritualism. They succeeded, and Vanderbilt, whose wife died in 1868, enjoyed their company and gave them financial advice that enabled Woodhull to make a killing on the Gold Exchange in 1869. With those proceeds, Woodhull established Woodhull, Claflin and Company, the first brokerage company to be headed by a woman. Woodhull, an advocate of WOMEN'S RIGHTS, was more interested in politics and reform than in business, and she was influenced by Stephen Pearl Andrews, a radical reformer. In 1869 she attended a woman suffrage convention and in April 1870 announced her candidacy for president of the United States. To promote her campaign she established *Woodhull and Claflin's Weekly*, another first for a woman. Initially, it carried a fair amount of financial news, but it soon became a forum for women's suffrage and radical causes ranging from free love to socialism. The paper lasted six years and claimed as many as 20,000 subscribers.

Victoria Woodhull speaking to the Judiciary Committee of the House of Representatives, Washington, D.C., 1871 (*Library of Congress*)

Her success and audacity catapulted Woodhull into a position of leadership in the women's rights movement. She was prominent at the 1870 suffrage convention and in January 1871 appeared before the House Judiciary Committee arguing for women's suffrage. She became a new symbol of women's rights. SUSAN B. ANTHONY, Elizabeth Cady Stanton, ISABELLA BEECHER HOOKER, and others sought her out, and some like Hooker became lifelong friends. Others, however, were repelled by her spiritualism and her SOCIALISM, her divorce, and her bizarre personal life. (Canning Woodhull had surfaced and joined her extended family.) Woodhull expected radical LABOR to support both woman suffrage and her presidential candidacy, so she took up Karl Marx and financed the first English translation of the *Communist Manifesto*. She and Tennessee joined and led Section 12—the women's section—of the Marxist Workingmen's Association, only to have Section 12 expelled in 1872 because the leadership feared that *Woodhull and Claflin's Weekly*, with its mix of spiritualism and socialism with a dash of free love, made socialism appear ridiculous.

Although by 1872 her support from suffrage advocates and socialists had dwindled, Woodhull persisted in

her quest for the presidency. She organized the convention of the Equal Rights Party, which dutifully nominated her. Position papers written by Andrews and a biography by Theodore Tilton had already been published, and she campaigned widely, advocating women's suffrage, labor reforms, spiritualism, and free love. But Woodhull ran out of money and had to curtail her campaigning and even suspend publication of her *Weekly*.

With her campaign a failure, Woodhull defended her own views and exposed hypocritical moralism by publishing in the *Weekly* on November 2, 1872, the details of the adulterous BEECHER-TILTON SCANDAL. Although she and her sister were indicted for sending obscene material through the mails and spent election day in jail, they were acquitted. The scandal revived the *Weekly*, but then it declined and folded in 1876, the same year Woodhull divorced Blood. The following year Woodhull moved to and remained in England, renounced free love and spiritualism, wrote and lectured, achieved respectability, married a banker—John Biddulph Martin—in 1883, and survived him 30 years before she died on June 10, 1927, at Tewkesbury, England. Fascinating and multifaceted, Woodhull was part con artist and part reformer, part

adventurer and part humanitarian, part notorious and part respectable.

### World's Columbian Exposition (Chicago World's Fair) (1893)

The Columbian Exposition was scheduled for 1892 to honor the 400th anniversary of Columbus's voyage, but it opened a year late due to construction delays. Chicago civic leaders lobbied so vociferously to host the fair that New York newspapers disparagingly titled Chicago "the windy city." Building on successes like the 1876 PHILADELPHIA CENTENNIAL EXPOSITION and the 1889 Paris Exposition Universelle, the fair was a combination of cultural statement and trade show that epitomized much that was best and worst in American society in the 1890s.

The chosen site was Jackson Park, on the Lake Michigan waterfront south of the Chicago loop. The park had been laid out in 1871 by Olmsted, Vaux & Co. for the Chicago South Park Commission, but the landscape was redesigned by Frederick Law Olmsted for the fair, incorporating a second park and the connecting landscaped "midway" between them. A team of eminent designers, organized by Superintendent of the Works DANIEL BURNHAM, himself a leading Chicago architect, conceived the central court of honor as a Greek or Roman neoclassical city. The vistas of the grand court, with its peristyle and central statue of Columbia, so awed visitors that the neoclassical mode became the style of choice for post offices, courthouses, and major public buildings for the next quarter century. The glistening simulated-stone surfaces gave rise to the name "the white city." The vision of order and grandeur, so at odds with the grime and confusion of the working Victorian city, inspired a generation of so-called City Beautiful advocates with plans for urban reconstruction around the country.

Behind the formal facades were the buildings, 200 of them on 633 acres, with the largest of them devoted to the products of America's industrial might. Sixty-two locomotives and complete passenger trains were displayed in the transportation building, whose arched golden portal, designed by LOUIS SULLIVAN, was the largest exception to the general neoclassicism. The manufactures and liberal arts building, with 38 acres of clear space unimpeded by columns under its steel-framed roof, was the largest build-

ing in the world and itself a demonstration of American building technology.

Beyond the industrial displays the visitor encountered the art museum, today rebuilt as the Chicago Museum of Science and Industry, the only remaining structure on the site. Prominently situated on the lagoon was the Woman's Building, the first major building in the United States designed by a woman, 23-year-old SOPHIA G. HAYDEN, winner of the competition to design the building. Though male architects tried to disparage her, Hayden won three awards for the building. She was the first woman to graduate from the four-year architectural course at Massachusetts Institute of Technology.

Inside the building were busts of suffrage leaders SUSAN B. ANTHONY and Elizabeth Cady Stanton. On May 15, 1893, the World Congress of Representative Women opened at the fair, with 150,000 women attending its week-long sessions. It had 500 delegates from 27 countries, with 126 organizations represented. Among its speakers were Anthony, Stanton, and LUCY STONE.

Poster for the World's Columbian Exposition, 1893 (Library of Congress)

Farther away, beyond the state exhibits, was the Midway Plaisance, an amusement area that gives us our term *midway*. The original Ferris wheel, 250 feet high, held 1,400 people at a time in enclosed cabins. The Midway also held foreign displays, some of which reflected the racism prevalent at the time. The Dahomey Village warriors perpetuated the stereotype of blacks as savages, and billing the Samoan Islanders as “recently rescued from cannibalism” emphasized their reputed appetite for human flesh. The belly dance of “Little Egypt” scandalized and fascinated the nation, and processions from the “primitive cultures,” including camels and rickshaws, entered the White City like emissaries of subject powers sent to the new imperial Rome. But exhibits of other non-Westerners including Japanese and Ceylonese temples, a Moroccan mosque, a Chinese theater and tea house, and a Hawaiian volcano were not demeaning.

The fair hosted 27 million visitors, the equivalent of almost half the national population. FREDERICK JACKSON TURNER’s talk at the fair reflected a Census Bureau report that the American frontier was now officially closed and with it a whole epoch in American history.

Ironically, the White City, with its vision of order, unity, and imperial domination, took place against a background of social and economic strife. The panic of 1893,

marked by business and bank failures, created massive unemployment and led to the PULLMAN STRIKE the following year. Thousands of workers living on the exposition grounds during construction were protected from agitators and labor organizers by barbed wire and guards. AFRICAN AMERICANS were excluded from even the most menial of jobs building and maintaining the fair, and they were provided eating and rest-room facilities only in the Haiti building, provoking Frederick Douglass to call the white city “a whited sepulchre.” When the grounds were turned back to the South Park Commission in 1894, the result was a riot of looting, followed the next day by the first of a series of fires that destroyed the white city and its orderly vision of serenity.

## yellow journalism

Ervin Wardman, editor of the *New York Press*, coined the phrase *yellow journalism* in 1896 to connote the questionable journalistic practices employed by William Randolph Hearst's *New York Journal* and JOSEPH PULITZER's *New York World* in their fight for circulation and readership. Hearst bought the *New York Morning Journal* in 1895, which had been founded in 1882 by Albert Pulitzer (Joseph's younger brother), and he was determined to surpass in popularity Pulitzer's *World*, known for its lively news coverage, low-brow ADVERTISING, and civic mindedness. (The *World* for example had raised \$100,000 to complete the base of the STATUE OF LIBERTY.) Hearst began the war with copious illustrations; an emphasis on crime, disasters, and scandals; and abundant feature material that made the *Journal* distinctly sensational and in direct competition with the *World*. Hearst used his considerable wealth to practice "checkbook journalism." He hired away the entire Sunday staff of the *World* and erected huge billboards and plastered blank walls with advertisements of *Journal* features. Circulation bounded upward and soon approached the numbers of the thriving *World*. The *World* responded in kind, and in their newspaper war both Hearst and Pulitzer focused on gossip, scandal, and crime and used questionable reporting techniques to gather as well as create news.

The rivalry came to a head with the papers' Sunday editions; though fairly equal in circulation during the week,

Pulitzer's *World* pulled ahead on Sundays with four pages of its eight-page comic section printed in color. The *Journal* began a similar section in 1896, heralding "eight pages of iridescent polychromatic effulgence that makes the rainbow look like a lead pipe." The pride of its Sunday comic section and readers' favorite was the strip "The Yellow Kid," drawn by Richard Outcault, whom Hearst had lured away from Pulitzer. Not to be outdone, Pulitzer hired artist George Luks to create a second "Yellow Kid" in the *World*, and the silly boy with the toothless vacant grin and yellow outfit soon symbolized the journalistic depths to which the two newspapers sank in their rivalry.

# Chronology

---

## 1870

Hiram Revels becomes the first African American to serve in the U.S. Congress when he is seated as a senator from Mississippi.

The U.S. Weather Bureau is established.

Victoria Woodhull becomes the first woman to run for president of the United States; her magazine *Woodhull & Claflin's Weekly* promotes her radical platform, ranging from woman suffrage to free love to socialism.

The states ratify the Fifteenth Amendment, granting black men the right to vote.

The Standard Oil Company of Ohio is organized by John D. Rockefeller, whose aim is to monopolize the oil refining industry.

New York City runs the first steam-powered elevated train, or “el.”

## 1871

Fire sweeps through Chicago, destroying 18,000 buildings and leaving 90,000 homeless.

U.S. Congress passes the Indian Appropriation Act, with a rider declaring that henceforth Indian tribes or nations would not be regarded as independent nations; in effect, this makes Native Americans wards of the government.

The Ku Klux Klan Enforcement Act of 1871 attempts to curtail the Ku Klux Klan's intimidation of black voters.

The United States and Britain sign the Treaty of Washington of 1871, in which both parties agreed to arbitrate boundary and fishing rights disputes and compensation due to the United States for Britain's dubious neutrality in the U.S. Civil War.

Political leader William “Boss” Tweed is indicted for fraud and corruption in New York City; Thomas Nast's magazine cartoons featuring Tweed help turn public opinion against him.

Showman P. T. Barnum opens a circus called “The Greatest Show on Earth.”

American-born artist James Whistler paints his best-known work, a portrait of his mother.

Reacting to Apache raids, vigilantes from Tucson, Arizona, massacre up to 150 Apache men, women, and children at Camp Grant, Arizona, initiating 15 years of intermittent warfare.

## 1872

The Amnesty Act of 1872 allows a large number of former Confederate supporters to hold civil or military office.

The Yellowstone National Park Act of 1872 establishes the world's first national park in parts of what is now Wyoming, Montana, and Idaho.

The American Public Health Association is founded to improve sanitation in socially disadvantaged neighborhoods.

Horace Greeley, nominated by both the Democratic Party and the Liberal Republican Party, becomes the first candidate to personally campaign for president. Republican incumbent Ulysses S. Grant defeats Greeley, who dies shortly afterward.

## 1873

U.S. diplomatic relations with Spain are strained when Spanish authorities execute 53 of the passengers and crew of the *Virginius*—supporters of the Cuban Revolution—sailing under the American flag.

The Timber Culture Act of 1873 authorizes any person who keeps 40 acres of timberland in good condition to acquire title to 160 additional acres of timberland.

The Comstock Law of 1873 prohibits the sending of obscene materials through the U.S. mail.

The panic of 1873 results in an economic depression and widespread unemployment. It is prompted by

the collapse of Jay Cooke & Company, a major financial institution.

The Coinage Act of 1873 demonetizes silver and makes gold the sole basis of U.S. currency just as an increased supply of silver becomes available, which, if minted, would have eased payment of debts. Opponents label the law the “Crime of ’73.”

In *Bradwell v. Illinois*, the U.S. Supreme Court upholds a state’s right to deny admission to the bar on the basis of sex.

The “Women’s War” breaks out across the United States as thousands of women shut down an estimated 3,000 saloons. Activists form the Women’s Christian Temperance Union, led by Frances Willard, to focus attention on the problems associated with drunkenness.

#### 1874

Prospectors discover gold in the Black Hills of South Dakota, sacred hunting territory that was included in the Great Sioux Reservation by the Treaty of Fort Laramie of 1868. The ensuing gold rush touches off a war between the U.S. government and the Sioux.

St. Louis’s Eads Bridge opens; it is the first steel bridge in the United States.

Barbed wire is commercially manufactured, permitting fencing of property in treeless regions, especially the West and Southwest.

John Fiske’s *Outlines of Cosmic Philosophy* offers a reconciliation of Darwinism and Scripture that many liberal Christians come to embrace.

#### 1875

The Civil Rights Act of 1875 mandates the end of racial discrimination in public accommodations.

Mary Baker Eddy publishes *Science and Health*, the chief text of the Christian Science movement.

The Specie Resumption Act of 1875 authorizes the U.S. Treasury on January 1, 1879, to redeem the paper money issued during the Civil War, known as “greenbacks,” with gold coins; this act returns the U.S. to the gold standard.

After successfully advocating for state regulation of railroad freight rates, the Granger movement gathers strength as hundreds of thousands of farmers join its ranks.

In *Minor v. Happersett*, the U.S. Supreme Court rejects the assertion of the National Woman Suffrage Association that the Fourteenth Amendment provides all U.S. citizens, including women, the right to vote.

#### 1876

Physicist Josiah Gibbs publishes his scientific theories, which provide the foundations of the field of physical chemistry.

Johns Hopkins University is established as a center of scholarly research emphasizing its graduate programs. Yale and Harvard had already awarded Ph.Ds but they concentrate on undergraduates.

Inventor Alexander Graham Bell patents the telephone.

Sitting Bull and Crazy Horse lead the Sioux and Cheyenne in major victories against the U.S. Army, first in the Battle of the Rosebud and then at Little Bighorn against General George Armstrong Custer, where Custer’s entire force is wiped out.

The United States celebrates its 100th anniversary with the Centennial Exhibition in Philadelphia. On July 4, Susan B. Anthony and her colleagues interrupt official ceremonies to demand women’s rights in fulfillment of the ideals of 1776.

Democratic presidential candidate Samuel J. Tilden receives a majority of the votes cast but is defeated by Republican Rutherford B. Hayes in the electoral college following a dispute over the official returns in three southern states.

Thomas Edison establishes his “invention factory” in Menlo Park, New Jersey.

Columbia, Yale, Princeton, and Harvard agree to standardize rules for American football.

Felix Adler begins the Ethical Culture movement.

#### 1877

Republican governments fall in South Carolina and Louisiana, marking the end of Reconstruction.

During the Nez Perce War, Chief Joseph leads his people more than 1,700 miles through the wilderness toward the Canadian border, eluding the U.S. cavalry. After a final encounter in northern Montana, Joseph surrenders, and the Nez Perce are moved to Indian Territory, but ultimately they are allowed to return to the Pacific Northwest.

Repeated wage cuts spur numerous independent strikes among railroad workers that become known collectively as the Great Strike of 1877.

Thomas Edison invents the phonograph.

Alfred T. White begins the American housing-reform movement by building the Home Buildings in Brooklyn, New York.

The Supreme Court in *Munn v. Illinois* upholds a law setting rates for Chicago grain elevators on grounds that their function involves “a public interest.”

#### 1878

A yellow fever epidemic breaks out in Memphis, Tennessee, killing one out of every nine residents.

The Bland-Allison Act of 1878 reinstates the use of limited quantities of silver currency.

The Knights of Labor organizes on a national basis.

**1879**

The U.S. Geological Survey is established to investigate the nation's mineral resources.

Groups of blacks, led by Benjamin "Pap" Singleton and others, migrate from the South to the West in the "Exodus of '79."

In *Progress and Poverty*, economist Henry George argues that the government should tax property owners for appreciation caused by rising demand, especially in cities; this "Single Tax" would replace all other taxes.

As the result of a bill she drafted, Belva Lockwood becomes the first woman lawyer to argue before the U.S. Supreme Court.

Thomas Edison invents the incandescent light bulb, making electric light practical.

Mary Cassatt exhibits her paintings with the impressionists in Paris.

Second-class postage is created, permitting the shipment of packages of up to four pounds anywhere in the United States for a flat rate of one cent per ounce.

Charles McKim, William Mead, and Stanford White open their New York City architectural office; the firm is to create many of the country's most prominent public buildings in the Beaux Arts style.

**1880**

Republican James A. Garfield is elected president over Democrat W. S. Hancock.

**1881**

Humanitarian and former Civil War nurse Clara Barton founds the American Red Cross.

*A Century of Dishonor*, by Helen Hunt Jackson, is published; the book urges better treatment of Indians.

Booker T. Washington founds the Tuskegee Institute in Alabama.

President James A. Garfield is assassinated; Vice President Chester Arthur becomes president.

Henry Demarest Lloyd's article "The Story of a Great Monopoly" is published in *Atlantic Monthly*; the article establishes Lloyd as the first muckraker.

**1882**

John L. Sullivan begins a 10-year reign as world heavyweight champion.

Apache warrior Geronimo leads a raid on the San Carlos Reservation in Arizona, freeing several hundred Apache and renewing the Apache War against both U.S. and Mexican authorities.

To better control his oil monopoly, John D. Rockefeller reorganizes Standard Oil using a trust agreement. Other industries soon follow suit.

The U.S. Congress passes the Chinese Exclusion Act prohibiting the immigration of laborers from China.

The *First Modern Suite*, by composer Edward MacDowell, is performed in Zurich, Switzerland. MacDowell is the first American-born composer whose works are performed in Europe.

The *Chicago Tribune* begins its annual accounting of lynchings in the United States, publicizing the practice of terrorism against African Americans and their supporters.

**1883**

The Council of Bishops convenes in Baltimore and plans a widespread system of Catholic parochial schools.

The Brooklyn Bridge opens.

Buffalo Bill's Wild West show begins touring; it becomes an international entertainment sensation.

U.S. Supreme Court declares the Civil Rights Act of 1875 unconstitutional, opening the way for Jim Crow legislation in the South.

Congress ratifies the Pendleton Act of 1883, ending a long political battle over civil service reform. The act opens some civil offices to competitive entry rather than political patronage; prohibits assessments, the long-standing practice of demanding a percentage of civil servants' salaries for party campaigns; and establishes the U.S. Civil Service Commission to enforce reforms.

**1884**

Republican James G. Blaine narrowly loses a heated presidential election to Democrat Grover Cleveland.

Samuel Clemens publishes *The Adventures of Huckleberry Finn* under his pen name Mark Twain.

**1885**

Social Gospel minister Josiah Strong publishes *Our Country: Its Possible Future and Its Present Crisis*, which urges Americans to combat social evils, economic distress, and political corruption at home and to spread "superior" Anglo-Saxon institutions throughout the world.

The decade-long lobbying efforts of the Knights of Labor are rewarded when Congress passes a law prohibiting the importation of contract laborers.

**1886**

Samuel Gompers founds the American Federation of Labor.

An anarchist rally in Chicago's Haymarket Square turns into a riot when someone throws a bomb at police; the bombing prompts the hasty roundup and conviction of Chicago's known radicals.

Emily Dickinson, a reclusive New Englander, dies; family members discover 1,800 lyric poems in her bedroom.

In *Wabash v. Illinois*, the U.S. Supreme Court strikes down pro-farmer Granger laws, ruling that states cannot regulate interstate commerce.

*Harper's* magazine first prints the illustrations of Fred-eric Remington; Remington's art comes to shape Americans' perception of the frontier West.

The Apache Wars conclude when Geronimo surrenders.

In *Santa Clara County v. Southern Pacific Railroad Company*, the U.S. Supreme Court extends the protections of the Fourteenth Amendment to corporations.

Statue of Liberty is dedicated in New York harbor.

### 1887

U.S. Congress passes the Dawes Severalty Act, which dissolves Native American tribes as legal entities and requires the division of jointly held lands into individual Native American homesteads.

Henry F. Bowers founds the American Protective Association; it becomes the largest of America's many nativist organizations.

Nikola Tesla invents an alternating current (AC) motor and the next year sells his AC patents for generators, transformers, and motors to George Westinghouse. Soon AC electricity becomes the preferred power source for electric streetcars, elevated trains, and subways.

U.S. Congress creates the Interstate Commerce Commission, the first federal regulatory agency.

U.S. Congress passes the Electoral Count Act of 1887, which is designed to prevent disputes over presidential elections such as the one in 1876.

### 1888

Republican Benjamin Harrison wins a close presidential race over Grover Cleveland.

British diplomat James Bryce publishes *The American Commonwealth*, a perceptive analysis of American political institutions.

George Eastman introduces the Kodak portable box camera and revolutionizes photography.

### 1889

The *North American Review* publishes Andrew Carnegie's essay "The Gospel of Wealth." The industrialist writes that the duty of the rich man is to be a "trustee for the poor."

Oklahoma, once part of Indian Territory, is opened to white settlement; massive "land rushes" follow.

The former Native American enclaves of North Dakota, South Dakota, and Montana are granted statehood.

Wovoka, a Paiute Indian, sees a vision that gives momentum to the Ghost Dance religion; large numbers of Sioux Indians leave their reservations to join the religious gatherings on the plains.

Jane Addams founds Hull-House, an organization whose goal is to improve the lives of the largely immigrant urban poor of Chicago; many similar institutions, known as settlement houses, are established in American cities.

Montgomery Ward & Company is established. Its catalog, containing 24,000 items, brings the department store to rural America.

Elisha Otis invents the electric elevator.

### 1890

William James publishes *Principles of Psychology*, which helps establish psychology as a field of study in the United States.

U.S. Congress passes the Sherman Antitrust Act in response to growing hostility to industrial monopolies.

The protectionist McKinley Tariff Act imposes the highest import duties in U.S. history to date but also provides for the novel feature of reciprocal trade agreements.

Illustrator Charles Dana Gibson introduces the Gibson Girl.

President Benjamin Harrison signs the Dependents Pension Act, the United States's first social welfare program, which provides pensions for disabled Civil War veterans and their families. The law's passage demonstrates the lobbying power of the Grand Army of the Republic, the largest U.S. veterans' organization.

Ending a long-standing rivalry, the conservative American Woman Suffrage Association merges with the more radical National Woman Suffrage Association to form the National American Woman Suffrage Association.

Jacob Riis publishes *How the Other Half Lives*, which documents the plight of the urban poor through text and photographs.

The superintendent of the census announces that the frontier line no longer exists.

The Sherman Silver Purchase Act increases the minimum amount of silver the federal government is required to buy and mint from \$2 million per month to 4.5 million ounces per month at prevailing market prices. The goal of this "soft money" policy is to raise prices by encouraging inflation.

The Association of American Medical Colleges is established to set standards for medical instruction.

At the urging of naturalist John Muir, U.S. Congress creates Yosemite National Park.

The National Farmers' Alliance and Industrial Union meets at Ocala, Florida. Attendees draft a statement that demands abolition of national banks and protective tariffs; free coinage of silver; a graduated income tax; government control of railroads and public utilities; and the direct election of U.S. senators.

U.S. troops massacre more than 200 Sioux at Wounded Knee Creek, South Dakota; Wounded Knee marks the end

of the long struggle of Native Americans against white expansion in the West.

### 1891

The Forest Reserve Act of 1891 authorizes the president to withhold certain public lands from the public domain.

The International Copyright Law of 1891 prohibits the previously common practice of reprinting foreign works without paying for the right to do so. One consequence is a larger market for American authors.

### 1892

“March King” John Philip Sousa forms the Sousa Band, which performs his marches and other popular American music around the world for nearly 40 years.

Ida B. Wells, editor of the newspaper *Free Speech*, reports on how lynching is used by white businessmen to eliminate black competitors.

Carnegie Steel imports scab workers and Pinkerton detectives to break the Amalgamated Union strike at Homestead Mill; 16 die and 60 are wounded in the failed strike, which suppresses trade unionism in the steel industry for 40 years.

The People’s Party (or Populist Party), a reaction by western farmers against eastern business interests, holds its first national convention in Omaha, Nebraska; among its demands are the secret ballot and the unlimited coinage of silver.

State authorities use the militia to break a violent miners strike at Coeur d’ Alene, Idaho.

Grover Cleveland is elected president over incumbent Benjamin Harrison. Cleveland is the only U.S. president to serve two nonconsecutive terms. People’s Party candidate James B. Weaver also runs, gaining more than 1 million votes.

The General Electric Company is established, underwritten by J. P. Morgan Company.

### 1893

American businessmen in Hawaii overthrow the government of Queen Liliuokalani and encourage the United States to annex the islands.

The total number of bison on the Great Plains is estimated to be no more than 1,000.

The financial panic of 1893 brings about the most severe economic depression the United States has yet experienced, leaving many Americans destitute and unemployed.

The Sherman Silver Purchase Act is repealed.

### 1894

Jacob Coxey organizes a march on Washington, D.C., to demand government unemployment relief; capital city police forcibly disperse “Coxey’s Army.”

U.S. Congress incorporates in the Wilson-Gorman Tariff Act of 1894 the first peacetime income tax; a year later the U.S. Supreme Court rules the tax unconstitutional.

President Grover Cleveland sends federal troops to break the Pullman Strike on the pretext that strikers were illegally obstructing the movement of U.S. mail.

### 1895

Beginning with South Carolina, seven states use a grandfather clause to disenfranchise African Americans while preserving voting rights for poor and illiterate whites.

William Randolph Hearst’s *New York Journal* engages in a circulation war with Joseph Pulitzer’s *New York World*; the sensationalist bent of the feuding newspapers, which create as well as gather news, becomes known as “yellow journalism.”

In *United States v. E. C. Knight Company*, the U.S. Supreme Court narrowly defines commerce and emasculates the Sherman Antitrust Act of 1890 by declaring that the sugar trust’s monopoly of refining (manufacturing) did not restrain trade.

Booker T. Washington delivers his “Atlanta Compromise” speech at the Cotton Exposition in Atlanta. In this controversial speech, Washington accepts segregation in social matters in exchange for economic opportunities for African Americans.

### 1896

The first publicly screened motion picture is shown in New York City.

George Washington Carver accepts an appointment to Alabama’s Tuskegee Institute; his work there helps revive southern agriculture.

The world’s first hydroelectric generator, designed by Nikola Tesla, is completed at Niagara Falls.

*Plessy v. Ferguson* forms the legal basis for segregation by race. Justice John Marshall Harlan dissents from the U.S. Supreme Court’s ruling.

Henry Ford builds his first automobile.

William Jennings Bryan delivers his “Cross of Gold” speech, attacking the gold standard at the Democratic National Convention.

A prospector finds gold in Canada’s Yukon River Valley, spurring the Klondike gold rush.

Voter participation reaches its all-time high in the presidential race, which Republican William McKinley wins over Democrat William Jennings Bryan.

### 1897

U.S. Congress passes the Forest Management Act, which designates forest reserves as resources for timber, mining, and grazing.

U.S. Supreme Court prohibits the Interstate Commerce Commission from setting railroad freight rates.

The Dingley Tariff Act raises U.S. protective duties to their highest rate ever.

Alexander Crummell organizes the American Negro Academy to advance the race by developing the “talented tenth” of black Americans.

### 1898

A piece of private correspondence written by Spain’s minister to the United States, the so-called de Lôme letter, attacks U.S. president McKinley. The stolen letter, when published in 1898, is used to feed U.S. desire for war with Spain.

The USS *Maine* explodes in Havana harbor, Cuba. A naval investigation concludes that an underwater mine of indeterminate origin caused the blast, but newspapers blame Spain, increasing American appetite for a war.

U.S. Congress declares war on Spain. In the Pacific Ocean, Admiral George Dewey wins the Philippine Islands for the United States at Manila Bay.

Theodore Roosevelt leads the Rough Riders, a volunteer cavalry regiment, to a victory at San Juan and Kettle Hills in Cuba.

The United States formally annexes Hawaii.

An unprecedented wave of mergers sweeps through the American economy; after seven years and more than 3,000 mergers, two-fifths of the nation’s industrial wealth is concentrated in 328 large companies, many of them monopolies.

The Treaty of Paris ends the Spanish-American War; Spain cedes the Philippines and Puerto Rico to the United States; Cuba, nominally independent, in 1901 becomes a U.S. protectorate.

### 1899

Ragtime composer Scott Joplin publishes “Maple Leaf Rag,” which sells more than 1 million copies.

After the United States fails to support Philippine independence, Filipinos wage a guerrilla war against U.S. forces. The Filipino Insurrection fails but stirs sympathy and protest in the United States.

Secretary of State John Hay’s Open Door notes instruct U.S. embassies in Germany, Russia, Great Britain, France, Italy, and Japan to seek assurances that those powers will respect the trading rights of other nations within their spheres of influence.

## Susan B. Anthony's Speech on Woman Suffrage, 1871

In James Andrews, ed., *American Voices, Significant Speeches in American History, 1640–1945* (New York: Longman, 1989), pp. 300–301

Friends and fellow citizens: I stand before you tonight under indictment for the alleged crime of having voted at the last presidential election, without having a lawful right to vote. It shall be my work this evening to prove to you that in thus voting, I not only committed no crime, but, instead, simply exercised my *citizen's rights*, guaranteed to me and all United States citizens by the National Constitution, beyond the power of any State to deny.

The preamble of the Federal Constitution says:

"We, the people of the United States, in order to form a more perfect union, establish justice, insure *domestic* tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America."

It was we, the people; not we, the white male citizens; nor yet we, the male citizens; but we, the whole people, who formed the Union. And we formed it, not to give the blessings of liberty, but to secure them; not to the half of ourselves and the half of our posterity, but to the whole people—women as well as men. And it is a downright mockery to talk to women of their enjoyment of the blessings of liberty while they are denied the use of the only means of securing them provided by this democratic-republican government—the ballot.

For any State to make sex a qualification that must ever result in the disfranchisement of one entire half of the people is to pass a bill of attainder, or an *ex post facto* law, and is therefore a violation of the supreme law of the land. By it the blessings of liberty are for ever withheld from women

and their female posterity. To them this government has no just powers derived from the consent of the governed. To them this government is not a democracy. It is not a republic. It is an odious aristocracy; a hateful oligarchy of sex; the most hateful aristocracy ever established on the face of the globe; an oligarchy of wealth, where the rich govern the poor. An oligarchy of learning, where the educated govern the ignorant, or even an oligarchy of race, where the Saxon rules the African, might be endured; but this oligarchy of sex, which makes father, brothers, husband, sons, the oligarchs over the mother and sisters, the wife and daughters of every household—which ordains all men sovereigns, all women subjects, carries dissension, discord and rebellion into every home of the nation.

Webster, Worcester and Bouvier all define a citizen to be a person in the United States, entitled to vote and hold office.

The only question left to be settled now is: Are women persons? And I hardly believe any of our opponents will have the hardihood to say they are not. Being persons, then, women are citizens; and no State has a right to make any law, or to enforce any old law, that shall abridge their privileges or immunities. Hence, every discrimination against women in the constitutions and laws of the several States is today null and void, precisely as in every one against Negroes.

## Chief Joseph's "I Will Fight No More Forever" Speech, 1877

Courtesy Nez Perce Tribe, Department of Natural Resources, Lapwai, Idaho

### I Will Fight No More Forever

Tell General Howard I know his heart. What he told me before, I have in my heart. I am tired of fighting. Our

Chiefs are killed. Looking Glass is dead. Toohoolhoolzote is dead. The old men are all dead. It is the young men who say "yes" or "no." He who led on the young men is dead. It is cold and we have no blankets. The little children are freezing to death. My people, some of them, have run away to the hills and have no blankets, no food; no one knows where they are—perhaps freezing to death. I want to have time to look for my children among the dead. Hear me, my chiefs! I am tired; my heart is sick and sad. From where the sun now stands I will fight no more forever.

## A Century of Dishonor (1881)

### Helen Hunt Jackson

In Erik Bruun and Jay Crosby, eds., *Our Nation's Archives: the History of the United States in Documents* (New York: Black Dog & Leventhal Publishers, 1999), pp. 425–427

The winter of 1877 and summer of 1878 were terrible seasons for the Cheyennes. Their fall hunt had proved unsuccessful. Indians from other reservations had hunted the ground over before them, and driven the buffalo off; and the Cheyennes made their way home again in straggling parties, destitute and hungry. Their agent reports that the result of this hunt has clearly proved that "in the future the Indian must rely on tilling the ground as the principal means of support; and if this conviction can be firmly established, the greatest obstacle to advancement in agriculture will be overcome. With the buffalo gone, and their pony herds being constantly decimated by the inroads of horse-thieves, they must soon adopt, in all its varieties, the way of the white man."

The ration allowed to these Indians is reported as being "reduced and insufficient," and the small sums they have been able to earn by selling buffalo hides are said to have been "of material assistance" to them in "supplementing" this ration. But in this year there have been sold only \$657 worth of skins by the Cheyennes and Arapahoes together. In 1876 they sold \$17,600 worth. Here is a falling off enough to cause very great suffering in a little community of five thousand people. But this was only the beginning of their troubles. The summer proved one of unusual heat. Extreme heat, chills and fever, and "a reduced and insufficient ration," all combined, resulted in an amount of sickness heart-rending to read of. "It is no exaggerated estimate," says the agent, "to place the number of sick people on the reservation at two thousand. Many deaths occurred which might have been obviated had there been a proper supply of antimalarial remedies at hand. Hundreds applying for treatment have been refused medicine."

The Northern Cheyennes grew more and more restless and unhappy. "In council and elsewhere they profess an intense desire to be sent North, where they say they

will settle down as the others have done," says the report; adding, with an obtuseness which is inexplicable, that "no difference has been made in the treatment of the Indians," but that the "compliance of these Northern Cheyennes has been of an entirely different nature from that of the other Indians," and that it may be "necessary in the future to compel what so far we have been unable to effect by kindness and appeal to their better natures."

If it is "an appeal to men's better natures" to remove them by force from a healthful Northern climate, which they love and thrive in, to a malarial Southern one, where they are struck down by chills and fever—refuse them medicine which can combat chills and fever, and finally starve them—there indeed, might be said to have been most forcible appeals made to the "better natures" of these Northern Cheyennes. What might have been predicted followed.

Early in the autumn, after this terrible summer, a band of some three hundred of these Northern Cheyennes took the desperate step of running off and attempting to make their way back to Dakota. They were pursued, fought desperately, but were finally overpowered, and surrendered. They surrendered, however, only on the condition that they should be taken to Dakota. They were unanimous in declaring that they would rather die than go back to the Indian Territory. This was nothing more, in fact, than saying that they would rather die by bullets than of chills and fever and starvation.

These Indians were taken to Fort Robinson, Nebraska. Here they were confined as prisoners of war, and held subject to the orders of the Department of the Interior. The department was informed of the Indians' determination never to be taken back alive to Indian Territory. The army officers in charge reiterated these statements, and implored the department to permit them to remain at the North; but it was of no avail. Orders came—explicit, repeated, finally stern—insisting on the return of these Indians to their agency. The commanding officer at Fort Robinson has been censured severely for the course he pursued in his effort to carry out those orders. It is difficult to see what else he could have done, except to have resigned his post. He could not take three hundred Indians by sheer brute force and carry them hundreds of miles, especially when they were so desperate that they had broken up the iron stoves in their quarters, and wrought and twisted them into weapons with which to resist. He thought perhaps he could starve them into submission. He stopped the issue of food; he also stopped the issue of fuel to them. It was midwinter; the mercury froze in that month at Fort Robinson. At the end of two days he asked the Indians to let their women and children come out that he might feed them. Not a woman would come out. On the night of the fourth day—or, according to some accounts, the sixth—these starving, freezing Indians broke prison, overpowered

the guards, and fled, carrying their women and children with them. They held the pursuing troops at bay for several days; finally made a last stand in a deep ravine, and were shot down—men, women, and children together. Out of the whole band there were left alive some fifty women and children and seven men, who having been confined in another part of the fort, had not had the good fortune to share in this outbreak and meet their death in the ravine. These, with their wives and children, were sent to Fort Leavenworth to be put in prison; the men to be tried for murders committed in their skirmishes in Kansas on their way to the north. Red Cloud, a Sioux chief, came to Fort Robinson immediately after this massacre and entreated to be allowed to take the Cheyenne widows and orphans into his tribe to be cared for. The Government, therefore, kindly permitted twenty-two Cheyenne widows and thirty-two Cheyenne children—many of them orphans—to be received into the band of the Ogallalla Sioux.

An attempt was made by the Commissioner of Indian Affairs, in his Report for 1879, to show by tables and figures that these Indians were not starving at the time of their flight from Indian Territory. The attempt only redounded to his own disgrace; it being proved, by the testimony given by a former clerk of the Indian Bureau before the Senate committee appointed to investigate the case of the Northern Cheyennes, that the commissioner had been guilty of absolute dishonesty in his estimates, and that the quantity of beef actually issued to the Cheyenne Agency was hundreds of pounds less than he had reported it, and that the Indians were actually, as they had claimed, “starving.”

The testimony given before this committee by some of the Cheyenne prisoners themselves is heart-rending. One must have a callous heart who can read it unmoved.

When asked by Senator [John T.] Morgan [of Alabama], “Did you ever really suffer from hunger?” one of the chiefs replied. “We were always hungry; we never had enough. When they that were sick once in awhile felt as though they could eat something, we had nothing to give them.”

“Did you not go out on the plains sometimes and hunt buffalo, with the consent of the agent?”

“We went out on a buffalo-hunt, and nearly starved while out; we could not find any buffalo hardly; we could hardly get back with our ponies; we had to kill a good many of our ponies to eat, to save ourselves from starving.” “How many children got sick and died?”

“Between the fall of 1877 and 1878 we lost fifty children. A great many of our finest young men died, as well as many women.”

“Old Crow,” a chief who served faithfully as Indian scout and ally under General [George] Crook for years, said: “I did not feel like doing anything for awhile, because I had no heart. I did not want to be in this country. I was all

the time wanting to get back to the better country where I was born, and where my children are buried, and where my mother and sister yet live. So I have laid in my lodge most of the time with nothing to think about but that, and the affair up north at Fort Robinson, and my relatives and friends who were killed there. But now I feel as though, if I had a wagon and a horse or two, and some land, I would try to work. If I had something, so that I could do something, I might not think so much about these other things. As it is now, I feel as though I would just as soon be asleep with the rest.”

The wife of one of the chiefs confined at Fort Leavenworth testified before the committee as follows: “The main thing I complained of was that we didn’t get enough to eat; my children nearly starved to death; then sickness came, and there was nothing good for them to eat; for a long time the most they had to eat was corn-meal and salt. Three or four children died every day for awhile, and that frightened us.”

When asked if there were anything she would like to say to the committee, the poor woman replied: “I wish you would do what you can to get my husband released. I am very poor here, and do not know what is to become of me. If he were released he would come down here, and we would live together quietly, and do no harm to anybody, and make no trouble. But I should never get over my desire to get back north; I should always want to get back where my children were born, and died, and were buried. That country is better than this in every respect. There is plenty of good, cool water there—pure water—while here the water is not good. It is not hot there, nor so sickly. Are you going where my husband is? Can you tell when he is likely to be released? . . .

It is stated also that there was not sufficient clothing to furnish each Indian with a warm suit of clothing, “as promised by the treaty,” and that, “by reference to official correspondence, the fact is established that the Cheyennes and Arapahoes are judged as having no legal rights to any lands, having forfeited their treaty reservation by a failure to settle thereon,” and their “present reservation not having been, as yet, confirmed by Congress. Inasmuch as the Indians fully understood, and were assured that this reservation was given to them in lieu of their treaty reservation, and have commenced farming in the belief that there was no uncertainty about the matter it is but common justice that definite action be had at an early day, securing to them what is their right.”

It would seem that there could be found nowhere in the melancholy record of the experiences of our Indians a more glaring instance of confused multiplication of injustices than this. The Cheyennes were pursued and slain for venturing to leave this very reservation, which, it appears, is not their reservation at all, and they have no legal right to

it. Are there any words to fitly characterize such treatment as this from a great, powerful, rich nation, to a handful of helpless people?

### Chinese Exclusion Act, 1882

*United States Statutes at Large* (47th Cong., Sess I, chap. 126), pp. 58–61

May 6, 1882

#### An Act

To execute certain treaty stipulations relating to Chinese.

Whereas, in the opinion of the Government of the United States the coming of Chinese laborers to this country endangers the good order of certain localities within the territory thereof.

Therefore,

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That from and after the expiration of ninety days next after the passage of this act, and until the expiration of ten years next after the passage of this act, the coming of Chinese laborers to the United States be, and the same is hereby, suspended; and during such suspension it shall not be lawful for any Chinese laborer to come, or, having so come after the expiration of said ninety days, to remain within the United States.

Sec. 2. That the master of any vessel who shall knowingly bring within the United States on such vessel, and land or permit to be landed, any Chinese laborer, from any foreign port or place, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not more than five hundred dollars for each and every such Chinese laborer so brought, and may be also imprisoned for a term not exceeding one year.

Sec. 3. That the two foregoing sections shall not apply to Chinese laborers who were in the United States on the seventeenth day of November, eighteen hundred and eighty, or who shall have come into the same before the expiration of ninety days next after the passage of this act, and who shall produce to such master before going on board such vessel, and shall produce to the collector of the port in the United States at which such vessel shall arrive, the evidence herein-after in this act required of his being one of the laborers in this section mentioned; nor shall the two foregoing sections apply to the case of any master whose vessel, being bound to a port not within the United States, shall come within the jurisdiction of the United States by reason of being in distress or in stress of weather, or touching at any port of the United States on its voyage to any foreign port or place: *Provided*, That all Chinese laborers brought on such vessel shall depart with the vessel on leaving port.

Sec. 4. That for the purpose of properly identifying Chinese laborers who were in the United States on the seventeenth day of November, eighteen hundred and eighty, or who shall have come into the same before the expiration of ninety days next after the passage of this act, and in order to furnish them with the proper evidence of their right to go from and come to the United States of their free will and accord, as provided by the treaty between the United States and China dated November seventeenth, eighteen hundred and eighty, the collector of customs of the district from which any such Chinese laborer shall depart from the United States shall, in person or by deputy, go on board each vessel having on board any such Chinese laborer and cleared or about to sail from his district for a foreign port, and on such vessel make a list of all such Chinese laborers, which shall be entered in registry-books to be kept for that purpose, in which shall be stated the name, age, occupation, last place of residence, physical marks or peculiarities, and all facts necessary for the identification of each of such Chinese laborers, which books shall be safely kept in the custom-house; and every such Chinese laborer so departing from the United States shall be entitled to, and shall receive, free of any charge or cost upon application therefor, from the collector or his deputy, at the time such list is taken, a certificate, signed by the collector or his deputy and attested by his seal of office, in such form as the Secretary of the Treasury shall prescribe, which certificate shall contain a statement of the name, age, occupation, last place of residence, personal description, and facts of identification of the Chinese laborer to whom the certificate is issued, corresponding with the said list and registry in all particulars. In case any Chinese laborer after having received such certificate shall leave such vessel before her departure he shall deliver his certificate to the master of the vessel, and if such Chinese laborer shall fail to return to such vessel before her departure from port the certificate shall be delivered by the master to the collector of customs for cancellation. The certificate herein provided for shall entitle the Chinese laborer to whom the same is issued to return to and re-enter the United States upon producing and delivering the same to the collector of customs of the district at which such Chinese laborer shall seek to re-enter; and upon delivery of such certificate by such Chinese laborer to the collector of customs at the time of re-entry in the United States, said collector shall cause the same to be filed in the custom-house and duly canceled.

Sec. 5. That any Chinese laborer mentioned in section four of this act being in the United States, and desiring to depart from the United States by land, shall have the right to demand and receive, free of charge or cost, a certificate of identification similar to that provided for in section four of this act to be issued to such Chinese

laborers as may desire to leave the United States by water; and it is hereby made the duty of the collector of customs of the district next adjoining the foreign country to which said Chinese laborer desires to go to issue such certificate, free of charge or cost, upon application by such Chinese laborer, and to enter the same upon registry-books to be kept by him for the purpose, as provided for in section four of this act.

Sec. 6. That in order to the faithful execution of articles one and two of the treaty in this act before mentioned, every Chinese person other than a laborer who may be entitled by said treaty and this act to come within the United States, and who shall be about to come to the United States, shall be identified as so entitled by the Chinese Government in each case, such identity to be evidenced by a certificate issued under the authority of said government, which certificate shall be in the English language or (if not in the English language) accompanied by a translation into English, stating such right to come, and which certificate shall state the name, title, or official rank, if any, the age, height, and all physical peculiarities, former and present occupation or profession, and place of residence in China of the person to whom the certificate is issued and that such person is entitled conformably to the treaty in this act mentioned to come within the United States. Such certificate shall be prima-facie evidence of the fact set forth therein, and shall be produced to the collector of customs, or his deputy, of the port in the district in the United States at which the person named therein shall arrive.

Sec. 7. That any person who shall knowingly and falsely alter or substitute any name for the name written in such certificate or forge any such certificate, or knowingly utter any forged or fraudulent certificate, or falsely personate any person named in any such certificate, shall be deemed guilty of a misdemeanor; and upon conviction thereof shall be fined in a sum not exceeding one thousand dollars, and imprisoned in a penitentiary for a term of not more than five years.

Sec. 8. That the master of any vessel arriving in the United States from any foreign port or place shall, at the same time he delivers a manifest of the cargo, and if there be no cargo, then at the time of making a report of the entry of the vessel pursuant to law, in addition to the other matter required to be reported, and before landing, or permitting to land, any Chinese passengers, deliver and report to the collector of customs of the district in which such vessels shall have arrived a separate list of all Chinese passengers taken on board his vessel at any foreign port or place, and all such passengers on board the vessel at that time. Such list shall show the names of such passengers (and if accredited officers of the Chinese Government traveling on the business of that government, or their servants, with a note of such facts), and the names and other particulars,

as shown by their respective certificates; and such list shall be sworn to by the master in the manner required by law in relation to the manifest of the cargo. Any willful refusal or neglect of any such master to comply with the provisions of this section shall incur the same penalties and forfeiture as are provided for a refusal or neglect to report and deliver a manifest of the cargo.

Sec. 9. That before any Chinese passengers are landed from any such vessel, the collector, or his deputy, shall proceed to examine such passengers, comparing the certificates with the list and with the passengers; and no passenger shall be allowed to land in the United States from such vessel in violation of law.

Sec. 10. That every vessel whose master shall knowingly violate any of the provisions of this act shall be deemed forfeited to the United States, and shall be liable to seizure and condemnation in any district of the United States into which such vessel may enter or in which she may be found.

Sec. 11. That any person who shall knowingly bring into or cause to be brought into the United States by land, or who shall knowingly aid or abet the same, or aid or abet the landing in the United States from any vessel of any Chinese person not lawfully entitled to enter the United States, shall be deemed guilty of a misdemeanor, and shall, on conviction thereof, be fined in a sum not exceeding one thousand dollars, and imprisoned for a term not exceeding one year.

Sec. 12. That no Chinese person shall be permitted to enter the United States by land without producing to the proper officer of customs the certificate in this act required of Chinese persons seeking to land from a vessel. And any Chinese person found unlawfully within the United States shall be caused to be removed therefrom to the country from whence he came, by direction of the President of the United States, and at the cost of the United States, after being brought before some justice, judge, or commissioner of a court of the United States and found to be one not lawfully entitled to be or remain in the United States.

Sec. 13. That this act shall not apply to diplomatic and other officers of the Chinese Government traveling upon the business of that government, whose credentials shall be taken as equivalent to the certificate in this act mentioned, and shall exempt them and their body and household servants from the provisions of this act as to other Chinese persons.

Sec. 14. That hereafter no State court of the United States shall admit Chinese to citizenship; and all laws in conflict with this act are hereby repealed.

Sec. 15. That the words "Chinese laborers," wherever used in this act, shall be construed to mean both skilled and unskilled laborers and Chinese employed in mining.

Approved, May 6, 1882.

**Dawes Severalty Act, 1887**

*United States Statutes at Large* (49th Cong., 2d sess., chap. 119), pp. 388–391

**An Act**

*To provide for the allotment of lands in severalty to Indians on the various reservations, and to extend the protection of the laws of the United States and the Territories over the Indians, and for other purposes.*

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That in all cases where any tribe or band of Indians has been, or shall hereafter be, located upon any reservation created for their use, either by treaty stipulation or by virtue of an act of Congress or executive order setting apart the same for their use, the President of the United States be, and he hereby is, authorized, whenever in his opinion any reservation or any part thereof of such Indians is advantageous for agricultural and grazing purposes, to cause said reservation, or any part thereof, to be surveyed, or resurveyed if necessary, and to allot the lands in said reservation in severalty to any Indian located thereon in quantities as follows:

To each head of a family, one-quarter of a section;

To each single person over eighteen years of age, one-eighth of a section; and

To each orphan child under eighteen years of age, one-eighth of a section; and

To each other single person under eighteen years now living, or who may be born prior to the date of the order of the President directing an allotment of the lands embraced in any reservation, one-sixteenth of a section: *Provided*, That in case there is not sufficient land in any of said reservations to allot lands to each individual of the classes above named in quantities as above provided, the lands embraced in such reservation or reservations shall be allotted to each individual of each of said classes pro rata in accordance with the provisions of this act: *And provided further*, That where the treaty or act of Congress setting apart such reservation provides for the allotment of lands in severalty in quantities in excess of those herein provided, the President, in making allotments upon such reservation, shall allot the lands to each individual Indian belonging thereon in quantity as specified in such treaty or act: *And provided further*, That when the lands allotted are only valuable for grazing purposes, and additional allotment of such grazing lands, in quantities as above provided, shall be made to each individual.

Sec. 2. That all allotments set apart under the provisions of this act shall be selected by the Indians, heads of families selecting for their minor children, and the agents shall select for each orphan child, and in such manner as to embrace the improvements of the Indians making the

selection. Where the improvements of two or more Indians have been made on the same legal subdivision of land, unless they shall otherwise agree, a provisional line may be run dividing said lands between them, and the amount to which each is entitled shall be equalized in the assignment of the remainder of the land to which they are entitled under this act: *Provided*, That if any one entitled to an allotment shall fail to make a selection within four years after the President shall direct that allotments may be made on a particular reservation, the Secretary of the Interior may direct the agent of such tribe or band, if such there be, and if there be no agent, then a special agent appointed for that purpose, to make a selection for such Indian, which election shall be allotted as in cases where selections are made by the Indians, and patents shall issue in like manner.

Sec. 3. That the allotments provided for in this act shall be made by special agents appointed by the President for such purpose, and the agents in charge of the respective reservations on which the allotments are directed to be made, under such rules and regulations as the Secretary of the Interior may from time to time prescribe, and shall be certified by such agents to the Commissioner of Indian Affairs, in duplicate, one copy to be retained in the Indian Office and the order to be transmitted to the Secretary of the Interior for his action, and to be deposited in the General Land Office.

Sec. 4. That where any Indian not residing upon a reservation, or for whose tribe no reservation has been provided by treaty, act of Congress, or executive order, shall make settlement upon any surveyed or unsurveyed lands of the United States not otherwise appropriated, he or she shall be entitled, upon application to the local land-office for the district in which the lands are located, to have the same allotted to him or her, and to his or her children, in quantities and manner as provided in this act for Indians residing upon reservations; and when such settlement is made upon unsurveyed lands, the grant to such Indians shall be adjusted upon the survey of the lands so as to conform thereto; and patents shall be issued to them for such lands in the manner and with the restrictions as herein provided. And the fees to which the officers of such local land-office would have been entitled had such lands been entered under the general laws for the disposition of the public lands shall be paid to them, from any moneys in the Treasury of the United States not otherwise appropriated, upon a statement of an account in their behalf for such fees by the Commissioner of the General Land Office, and a certification of such account to the Secretary of the Treasury by the Secretary of the Interior.

Sec. 5. That upon the approval of the allotments provided for in this act by the Secretary of the Interior; he shall cause patents to issue therefor in the name of the allottees, which patents shall be of the legal effect, and declare that

the United States does and will hold the land thus allotted, for the period of twenty-five years, in trust for the sole use and benefit of the Indian to whom such allotment shall have been made, or, in case of his decease, of his heirs according to the laws of the State or Territory where such land is located, and that at the expiration of said period the United States will convey the same by patent to said Indian, or his heirs as aforesaid, in fee, discharged of said trust and free of all charge or incumbrance whatsoever: *Provided*, That the President of the United States may in any case in his discretion extend the period. And if any conveyance shall be made of the lands set apart and allotted as herein provided, or any contract made touching the same, before the expiration of the time above mentioned, such conveyance or contract shall be absolutely null and void: *Provided*, That the law of descent and partition in force in the State or Territory where such lands are situate shall apply thereto after patents therefor have been executed and delivered, except as herein otherwise provided; and the laws of the State of Kansas regulating the descent and partition of real estate shall, so far as practicable, apply to all lands in the Indian Territory which may be allotted in severalty under the provisions of this act: *And provided further*, That at any time after lands have been allotted to all the Indians of any tribe as herein provided, or sooner if in the opinion of the President it shall be for the best interests of said tribe, it shall be lawful for the Secretary of the Interior to negotiate with such Indian tribe for the purchase and release by said tribe, in conformity with the treaty or statute under which such reservation is held, of such portions of its reservation not allotted as such tribe shall, from time to time, consent to sell, on such terms and conditions as shall be considered just and equitable between the United States and said tribe of Indians, which purchase shall not be complete until ratified by Congress, and the form and manner of executing such release shall also be prescribed by Congress: *Provided however*, That all lands adapted to agriculture, with or without irrigation so sold or released to the United States by any Indian tribe shall be held by the United States for the sole purpose of securing homes to actual settlers and shall be disposed of by the United States to actual and bona fide settlers only in tracts not exceeding one hundred and sixty acres to any one person, on such terms as Congress shall prescribe, subject to grants which Congress may make in aid of education: *And provided further*, That no patents shall issue therefor except to the person so taking the same as and for a homestead, or his heirs, and after the expiration of five years occupancy thereof as such homestead; and any conveyance of said lands so taken as a homestead, or any contract touching the same, or lien thereon, created prior to the date of such patent, shall be null and void. And the sums agreed to be paid by the United States as purchase money for any portion of any such reservation shall

be held in the Treasury of the United States for the sole use of the tribe or tribes of Indians; to whom such reservations belonged; and the same, with interest thereon at three per cent per annum, shall be at all times subject to appropriation by Congress for the education and civilization of such tribe or tribes of Indians or the members thereof. The patents aforesaid shall be recorded in the General Land Office, and afterward delivered, free of charge, to the allottee entitled thereto. And if any religious society or other organization is now occupying any of the public lands to which this act is applicable, for religious or educational work among the Indians, the Secretary of the Interior is hereby authorized to confirm such occupation to such society or organization, in quantity not exceeding one hundred and sixty acres in any one tract, so long as the same shall be so occupied, on such terms as he shall deem just; but nothing herein contained shall change or alter any claim of such society for religious or educational purposes heretofore granted by law. And hereafter in the employment of Indian police, or any other employees in the public service among any of the Indian tribes or bands affected by this act, and where Indians can perform the duties required, those Indians who have availed themselves of the provisions of this act and become citizens of the United States shall be preferred.

Sec. 6. That upon the completion of said allotments and the patenting of the lands to said allottees, each and every member of the respective bands or tribes of Indians to whom allotments have been made shall have the benefit of and be subject to the laws, both civil and criminal, of the State or Territory in which they may reside; and no Territory shall pass or enforce any law denying any such Indian within its jurisdiction the equal protection of the law. And every Indian born within the territorial limits of the United States to whom allotments shall have been made under the provisions of this act, or under any law or treaty, and every Indian born within the territorial limits of the United States who has voluntarily taken up, within said limits, his residence separate and apart from any tribe of Indians therein, and has adopted the habits of civilized life, is hereby declared to be a citizen of the United States, and is entitled to all the rights, privileges, and immunities of such citizens, whether said Indian has been or not, by birth or otherwise, a member of any tribe of Indians within the territorial limits of the United States without in any manner impairing or otherwise affecting the right of any such Indian to tribal or other property.

Sec. 7. That in cases where the use of water for irrigation is necessary to render the lands within any Indian reservation available for agricultural purposes, the Secretary of the Interior be, and he is hereby, authorized to prescribe such rules and regulations as he may deem necessary to secure a just and equal distribution thereof among the

Indians residing upon any such reservations; and no other appropriation or grant of water by any riparian proprietor shall be authorized or permitted to the damage of any other riparian proprietor.

Sec. 8. That the provision of this act shall not extend to the territory occupied by the Cherokees, Creeks, Choctaws, Chickasawas, Seminoles, and Osage, Miamies and Peorias, and Sacs and Foxes, in the Indian Territory, nor to any of the reservations of the Seneca Nation of New York Indians in the State of New York, nor to that strip of territory in the State of Nebraska adjoining the Sioux Nation on the south added by executive order.

Sec. 9. That for the purpose of making the surveys and resurveys mentioned in section two of this act, there be, and hereby is, appropriated, out of any moneys in the Treasury not otherwise appropriated, the sum of one hundred thousand dollars, to be repaid proportionately out of the proceeds of the sales of such land as may be acquired from the Indians under the provisions of this act.

Sec. 10. That nothing in this act contained shall be so construed as to affect the right and power of Congress to grant the right of way through any lands granted to an Indian, or a tribe of Indians, for railroads or other highways, or telegraph lines, for the public use, or to condemn such lands to public uses, upon making just compensation.

Sec. 11. That nothing in this act shall be so construed as to prevent the removal of the Southern Ute Indians from their present reservation in Southwestern Colorado to a new reservation by and with the consent of a majority of the adult male members of said tribe.

Approved, February 8, 1887.

## Interstate Commerce Act of 1887

*United States Statutes at Large* (49th Cong., 2d sess., chap. 104), pp. 379–387

### An Act

*To regulate commerce.*

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the provisions of this act shall apply to any common carrier or carriers engaged in the transportation of passengers or property wholly by railroad, or partly by railroad and partly by water when both are used, under a common control, management, or arrangement, for a continuous carriage or shipment, from one State or Territory of the United States, or the District of Columbia, to any other State or Territory of the United States, or the District of Columbia, or from any place in the United States to an adjacent foreign country, or from any place in the United States through a foreign country to any other place in the United States, and also to the transportation in like manner

of property shipped from any place in the United States to a foreign country and carried from such place to a port of trans-shipment, or shipped from a foreign country to any place in the United States and carried to such place from a port of entry either in the United States or an adjacent foreign country: *Provided, however,* That the provisions of this act shall not apply to the transportation of passengers or property, or to the receiving, delivering, storage, or handling of property, wholly within one State, and not shipped to or from a foreign country from or to any State or Territory as aforesaid.

The term “railroad” as used in this act shall include all bridges and ferries used or operated in connection with any railroad, and also all the road in use by any corporation operating a railroad, whether owned or operated under a contract, agreement, or lease; and the term “transportation” shall include all instrumentalities of shipment or carriage.

All charges made for any service rendered or to be rendered in the transportation of passengers or property as aforesaid, or in connection therewith, or for the receiving, delivering, storage, or handling of such property, shall be reasonable and just; and every unjust and unreasonable charge for such service is prohibited and declared to be unlawful.

Sec. 2. That if any common carrier subject to the provisions of this act shall, directly or indirectly, by any special rate, rebate, drawback, or other device, charge, demand, collect, or receive from any person or persons a greater or less compensation for any service rendered, or to be rendered, in the transportation of passengers or property, subject to the provisions of this act, than it charges, demands, collects, or receives from any other person or persons for doing for him or them a like and contemporaneous service in the transportation of a like kind of traffic under substantially similar circumstances and conditions, such common carrier shall be deemed guilty of unjust discrimination, which is hereby prohibited and declared to be unlawful.

Sec. 3. That it shall be unlawful for any common carrier subject to the provisions of this act to make or give any undue or unreasonable preference or advantage to any particular person, company, firm, corporation, or locality, or any particular description of traffic, in any respect whatsoever, or to subject any particular person, company, firm, corporation, or locality, or any particular description of traffic, to any undue or unreasonable prejudice or disadvantage in any respect whatsoever. Every common carrier subject to the provisions of this act shall according to their respective powers, afford all reasonable, proper, and equal facilities for the interchange of traffic between their respective lines, and for the receiving, forwarding, and delivering of passengers and property to and from their several lines and those connection therewith, and shall not discriminate in their rates and charges between such connecting lines; but

this shall not be construed as requiring any such common carrier to give the use of its tracks or terminal facilities to another carrier engaged in like business.

Sec. 4. That it shall be unlawful for any common carrier subject to the provisions of this act to charge or receive any greater compensation in the aggregate for the transportation of passengers or of like kind of property, under substantially similar circumstances and conditions, for a shorter than for a longer distance over the same line, in the same direction, the shorter being included within the longer distance; but this shall not be construed as authorizing any common carrier within the terms of this act to charge and receive as great compensation for a shorter as for a longer distance: *Provided, however,* That upon application to the Commission appointed under the provisions of this act, such common carrier may, in special cases, after investigation by the Commission, be authorized to charge less for longer than for shorter distances for the transportation of passengers or property; and the Commission may from time to time prescribe the extent to which such designated common carrier may be relieved from the operation of this section of this act.

Sec. 5. That it shall be unlawful for any common carrier subject to the provisions of this act to enter into any contract, agreement, or combination with any other common carrier or carriers for the pooling of freights of different and competing railroads, or to divide between them the aggregate or net proceeds of the earnings of such railroads, or any portion thereof; and in any case of an agreement for the pooling of freights as aforesaid, each day of its continuance shall be deemed a separate offense.

Sec. 6. That every common carrier subject to the provisions of this act shall print and keep for public inspection schedules showing the rates and fares and charges for the transportation of passengers and property which any such common carrier has established and which are in force at the time upon its railroad, as defined by the first section of this act. The schedules printed as aforesaid by any such common carrier shall plainly state the places upon its railroad between which property and passengers will be carried, and shall contain the classification of freight in force upon such railroad, and shall also state separately the terminal charges and any rules or regulations which in any wise change, affect, or determine any part or the aggregate of such aforesaid rates and fares and charges. Such schedules shall be plainly printed in large type, of at least the size of ordinary pica, and copies for the use of the public shall be kept in every depot or station upon any such railroad, in such places and in such form that they can be conveniently inspected. . . .

No advance shall be made in the rates, fares, and charges which have been established and published as aforesaid by any common carrier in compliance with the

requirements of this section, except after ten days' public notice, which shall plainly state the changes proposed to be made in the schedule then in force, and the time when the increased rates, fares, or charges will go into effect; . . .

And when any such common carrier shall have established and published its rates, fares, and charges in compliance with the provisions of this section, it shall be unlawful for such common carrier to charge, demand, collect, or receive from any person or persons a greater or less compensation for the transportation of passengers or property, or for any services in connection therewith, than is specified in such published schedule of rates, fares, and charges as may at the time be in force.

Every common carrier subject to the provisions of this act shall file with the Commission hereinafter provided for copies of its schedules of rates, fares, and charges which have been established and published in compliance with the requirements of this section, and shall promptly notify said Commission of all changes made in the same. Every such common carrier shall also file with said Commission copies of all contracts, agreements, or arrangements with other common carriers in relation to any traffic affected by the provisions of this act to which it may be a party. . . .

Sec. 9. That any person or persons claiming to be damaged by any common carrier subject to the provisions of this act may either make complaint to the Commission as hereinafter provided for, or may bring suit in his or their own behalf for the recovery of the damages for which such common carrier may be liable under the provisions of this act, in any district or circuit court of the United States of competent jurisdiction; . . .

Sec. 10. That any common carrier subject to the provisions of this act, or, whenever such common carrier is a corporation, any director or officer thereof, or any receiver, trustee, lessee, agent, or person acting for or employed by such corporation, who, alone or with any other corporation, company, person, or party, shall willfully do or cause to be done, or shall willingly suffer or permit to be done, any act, matter, or thing in this act prohibited or declared to be unlawful, or who shall aid or abet therein, or shall willfully omit or fail to do any act, matter, or thing in this act required to be done, or shall cause or willingly suffer or permit any act, matter, or thing so directed or required by this act to be done not to be so done, or shall aid or abet any such omission or failure, or shall be guilty of any infraction of this act, or shall aid or abet therein, shall be deemed guilty of a misdemeanor, and shall, upon conviction thereof in any district court of the United States within the jurisdiction of which such offense was committed, be subject to a fine of not to exceed five thousand dollars for each offense.

Sec. 11. That a Commission is hereby created and established to be known as the Inter-State Commerce

Commission, which shall be composed of five Commissioners, who shall be appointed by the President, by and with the advice and consent of the Senate. The Commissioners first appointed under this act shall continue in office for the term of two, three, four, five, and six years, respectively, from the first day of January, anno Domini eighteen hundred and eighty-seven, the term of each to be designated by the President; but their successors shall be appointed for terms of six years, except that any person chosen to fill a vacancy shall be appointed only for the unexpired term of the Commissioner whom he shall succeed. Any Commissioner may be removed by the President for inefficiency, neglect of duty, or malfeasance in office. Not more than three of the Commissioners shall be appointed from the same political party. No person in the employ of or holding any official relation to any common carrier subject to the provisions of this act, or owning stock or bonds thereof, or who is in any manner pecuniarily interested therein, shall enter upon the duties of or hold such office. Said Commissioners shall not engage in any other business, vocation, or employment. No vacancy in the Commission shall impair the right of the remaining Commissioners to exercise all the powers of the Commission.

Sec. 12. That the Commission hereby created shall have authority to inquire into the management of the business of all common carriers subject to the provisions of this act, and shall keep itself informed as to the manner and method in which the same is conducted, and shall have the right to obtain from such common carriers full and complete information necessary to enable the Commission to perform the duties and carry out the objects for which it was created; and for the purposes of this act the Commission shall have power to require the attendance and testimony of witnesses and the production of all books, papers, tariffs, contracts, agreements, and documents relating to any matter under investigation, and to that end may invoke the aid of any court of the United States in requiring the attendance and testimony of witnesses and the production of books, papers, and documents under the provisions of this section. . . .

Sec. 13. That any person, firm, corporation, or association, or any mercantile, agricultural, or manufacturing society, or any body politic or municipal organization complaining of anything done or omitted to be done by any common carrier subject to the provisions of this act in contravention of the provisions thereof, may apply to said Commission by petition, which shall briefly state the facts; whereupon a statement of the charges thus made shall be forwarded by the Commission to such common carrier, who shall be called upon to satisfy the complaint or to answer the same in writing within a reasonable time, to be specified by the Commission. If such common carrier, within the time specified, shall make reparation for

the injury alleged to have been done, said carrier shall be relieved of liability to the complainant only for the particular violation of law thus complained of. If such carrier shall not satisfy the complaint within the time specified, or there shall appear to be any reasonable ground for investigating said complaint, it shall be the duty of the Commission to investigate the matters complained of in such manner and by such means as it shall deem proper.

Said Commission shall in like manner investigate any complaint forwarded by the railroad commissioner or railroad commission of any State or Territory, at the request of such commissioner or commission, and may institute any inquiry on its own motion in the same manner and to the same effect as though complaint had been made. . . .

Sec. 16. That whenever any common carrier, as defined in and subject to the provisions of this act, shall violate or refuse or neglect to obey any lawful order or requirement of the Commission in this act named, it shall be the duty of the Commission, and lawful for any company or person interested in such order or requirement, to apply, in a summary way, by petition, to the circuit court of the United States sitting in equity in the judicial district in which the common carrier complained of has its principal office, or in which the violation or disobedience of such order or requirement shall happen, alleging such violation or disobedience, as the case may be; and the said court shall have power to hear and determine the matter, on such short notice to the common carrier complained of as the court shall deem reasonable; . . .

Sec. 20. That the Commission is hereby authorized to require annual reports from all common carriers subject to the provisions of this act, to fix the time and prescribe the manner in which such reports shall be made, and to require from such carriers specific answers to all questions upon which the Commission may need information. Such annual reports shall show in detail the amount of capital stock issued, the amounts paid therefor, and the manner of payment for the same; the dividends paid, the surplus fund, if any, and the number of stockholders; the funded and floating debts and the interest paid thereon; the cost and value of the carrier's property, franchises, and equipment; the number of employees and the salaries paid each class; the amounts expended for improvements each year, how expended, and the character of such improvements; the earnings and receipts from each branch of business and from all sources; the operating and other expenses; the balances of profit and loss; and a complete exhibit of the financial operations of the carrier each year, including an annual balance sheet. Such reports shall also contain such information in relation to rates or regulations concerning fares or freights, or agreements, arrangements, or contracts with other common carriers, as the Commission may require; and the said Commission may, within its discretion, for the

purpose of enabling it the better to carry out the purposes of this act, prescribe (if in the opinion of the Commission it is practicable to prescribe such uniformity and methods of keeping accounts) a period of time within which all common carriers subject to the provisions of this act shall have, as near as may be, a uniform system of accounts, and the manner in which such accounts shall be kept. . . .

## **"Wealth" (1889)**

### **Andrew Carnegie**

In John A. Scott, ed., *Living Documents in American History*, Vol. 1 (New York: Washington Square Press, 1964-68), pp. 102-114

The problem of our age is the proper administration of wealth, so that the ties of brotherhood may still bind together the rich and poor in harmonious relationship. The conditions of human life have not only been changed, but revolutionized, within the past few hundred years. In former days there was little difference between the dwelling, dress, food, and environment of the chief and those of his retainers. The Indians are to-day where civilized man then was. When visiting the Sioux, I was led to the wigwam of the chief. It was just like the others in external appearance, and even within the difference was trifling between it and those of the poorest of his braves. The contrast between the palace of the millionaire and the cottage of the laborer with us to-day measures the change which has come with civilization.

This change, however, is not to be deplored, but welcomed as highly beneficial. It is well, nay, essential for the progress of the race, that the houses of some should be homes for all that is highest and best in literature and the arts, and for all the refinements of civilization, rather than that none should be so. Much better this great irregularity than universal squalor. Without wealth there can be no Maecenas. The "good old times" were not good old times. Neither master nor servant was as well situated then as to-day. A relapse to old conditions would be disastrous to both—not the least so to him who serves—and would sweep away civilization with it. But whether the change be for good or ill, it is upon us, beyond our power to alter, and therefore to be accepted and made the best of. It is a waste of time to criticize the inevitable.

It is easy to see how the change has come. One illustration will serve for almost every phase of the cause. In the manufacture of products we have the whole story. It applies to all combinations of human industry, as stimulated and enlarged by the inventions of this scientific age. Formerly articles were manufactured at the domestic hearth or in small shops which formed part of the household. The master and his apprentices worked side by side, the latter living

with the master, and therefore subject to the same conditions. When these apprentices rose to be masters, there was little or no change in their mode of life, and they, in turn, educated in the same routine succeeding apprentices. There was, substantially, social equality, and even political equality, for those engaged in industrial pursuits had then little or no political voice in the State.

But the inevitable result of such a mode of manufacture was crude articles at high prices. To-day the world obtains commodities of excellent quality at prices which even the generation preceding this would have deemed incredible. In the commercial world similar causes have produced similar results, and the race is benefited thereby. The poor enjoy what the rich could not before afford. What were the luxuries have become the necessities of life. The laborer has now more comforts than the farmer had a few generations ago. The farmer has more luxuries than the landlord had, and is more richly clad and better housed. The landlord has books and pictures rarer, and appointments more artistic, than the King could then obtain.

The price we pay for this salutary change is, no doubt, great. We assemble thousands of operatives in the factory, in the mine, and in the counting-house, of whom the employer can know little or nothing, and to whom the employer is little better than a myth. All intercourse between them is at an end. Rigid Castes are formed, and, as usual, mutual ignorance breeds mutual distrust. Each Caste is without sympathy for the other, and ready to credit anything disparaging in regard to it. Under the law of competition, the employer of thousands is forced into the strictest economies, among which the rates paid to labor figure prominently, and often there is friction between the employer and the employed, between capital and labor, between rich and poor. Human society loses homogeneity.

The price which society pays for the law of competition, like the price it pays for cheap comforts and luxuries, is also great; but the advantages of this law are also greater still, for it is to this law that we owe our wonderful material development, which brings improved conditions in its train. But, whether the law is benign or not, we must say of it, as we say of the change in the conditions of men to which we have referred: It is here, we cannot evade it; no substitutes for it have been found; and while the law may be sometimes hard for the individual, it is best for the race, because it insures the survival of the fittest in every department. We accept and welcome, therefore, as conditions to which we must accommodate ourselves, great inequality of environment, the concentration of business, industrial and commercial, in the hands of a few, and the law of competition between these, as being not only beneficial, but essential for the future progress of the race. Having accepted these, it follows that there must be great scope for the exercise of special ability in the merchant and in the

manufacturer who has to conduct affairs upon a great scale. That this talent for organization and management is rare among men is proved by the fact that it invariably secures for its possessor enormous rewards, no matter where or under what laws or conditions. The experienced in affairs always rate the Man whose services can be obtained as a partner as not only the first consideration, but such as to render the question of his capital scarcely worth considering, for such men soon create capital; while, without the special talent required, capital soon takes wings. Such men become interested in forms or corporations using millions; and estimating only simple interest to be made upon the capital invested, it is inevitable that their income must exceed their expenditures, and that they must accumulate wealth. Nor is there any middle ground which such men can occupy, because the great manufacturing or commercial concern which does not earn at least interest upon its capital soon becomes bankrupt. It must either go forward or fall behind: to stand still is impossible. It is a condition essential for its successful operation that it should be thus far profitable, and even that, in addition to interest on capital, it should make profit. It is a law, as certain as any of the others named, that men possessed of this peculiar talent for affairs, under the free play of economic forces, must, of necessity, soon be in receipt of more revenue than can be judiciously expended upon themselves; and this law is as beneficial for the race as the others.

Objections to the foundations upon which society is based are not in order, because the condition of the race is better with these than it has been with any others which have been tried. Of the effect of any new substitutes proposed we cannot be sure. The Socialist or Anarchist who seeks to overturn present conditions is to be regarded as attacking the foundation upon which civilization itself rests, for civilization took its start from the day that the capable, industrious workman said to his incompetent and lazy fellow, "If thou dost not sow, thou shalt not reap," and thus ended primitive Communism by separating the drones from the bees. One who studies this subject will soon be brought face to face with the conclusion that upon the sacredness of property civilization itself depends—the right of the laborer to his hundred dollars in the savings bank, and equally the legal right of the millionaire to his millions. To those who propose to substitute Communism for this intense Individualism the answer, therefore, is: The race has tried that. All progress from that barbarous day to the present time has resulted from its displacement. Not evil, but good, has come to the race from the accumulation of wealth by those who have the ability and energy that produce it.

But even if we admit for a moment that it might be better for the race to discard its present foundation, Individualism, that it is a nobler ideal that man should labor,

not for himself alone, but in and for a brotherhood of his fellows, and share with them all in common, realizing Swedenborg's idea of Heaven, where, as he says, the angels derive their happiness, not from laboring for self, but for each other—even admit all this, and a sufficient answer is, This is not evolution, but revolution. It necessitates the changing of human nature itself—a work of aeons, even if it were good to change it, which we cannot know. It is not practicable in our day or in our age. Even if desirable theoretically, it belongs to another and long-succeeding sociological stratum. Our duty is with what is practicable now; with the next step possible in our day and generation. It is criminal to waste our energies in endeavoring to uproot, when all we can profitably or possibly accomplish is to bend the universal tree of humanity a little in the direction most favorable to the production of good fruit under existing circumstances. We might as well urge the destruction of the highest existing type of man because he failed to reach our ideal as to favor the destruction of Individualism, Private Property, the Law of Accumulation of Wealth, and the Law of Competition; for these are the highest results of human experience, the soil in which society so far has produced the best fruit. Unequally or unjustly, perhaps, as these laws sometimes operate, and imperfect as they appear to the Idealist, they are, nevertheless, like the highest type of man, the best and most valuable of all that humanity has yet accomplished.

We start, then, with a condition of affairs under which the best interests of the race are promoted, but which inevitably gives wealth to the few. Thus far, accepting conditions as they exist, the situation can be surveyed and pronounced good. The question then arises—and, if the foregoing be correct, it is the only question with which we have to deal—What is the proper mode of administering wealth after the laws upon which civilization is founded have thrown it into the hands of the few? And it is of this great question that I believe I offer the true solution. It will be understood that *fortunes* are here spoken of, not moderate sums saved by many years of effort, the returns from which are required for the comfortable maintenance and education of families. This is not *wealth*, but only *competence*, which it should be the aim of all to acquire.

There are but three modes in which surplus wealth can be disposed of. It can be left to the families of the decedents; or it can be bequeathed for public purposes; or, finally, it can be administered during their lives by its possessors. Under the first and second modes most of the wealth of the world that has reached the few has hitherto been applied. Let us in turn consider each of these modes. The first is the most injudicious. In monarchical countries, the estates and the greatest portion of the wealth are left to the first son, that the vanity of the parent may be gratified by the thought that his name and title are to

descend to succeeding generations unimpaired. The condition of this class in Europe to-day teaches the futility of such hopes or ambitions. The successors have become impoverished through their follies or from the fall in the value of land. Even in Great Britain the strict law of entail has been found inadequate to maintain the status of an hereditary class. Its soil is rapidly passing into the hands of the stranger. Under republican institutions the division of property among the children is much fairer, but the question which forces itself upon thoughtful men in all lands is: Why should men leave great fortunes to their children? If this is done from affection, is it not misguided affection? Observation teaches that, generally speaking, it is not well for the children that they should be so burdened. Neither is it well for the state. Beyond providing for the wife and daughters moderate sources of income, and very moderate allowances indeed, if any, for the sons, men may well hesitate, for it is no longer questionable that great sums bequeathed oftener work more for the injury than for the good of the recipients. Wise men will soon conclude that, for the best interests of the members of their families and of the state, such bequests are an improper use of their means . . .

As to the second mode, that of leaving wealth at death for public uses, it may be said that this is only a means for the disposal of wealth, provided a man is content to wait until he is dead before it becomes of much good in the world. Knowledge of the results of legacies bequeathed is not calculated to inspire the brightest hopes of much posthumous good being accomplished. The cases are not few in which the real object sought by the testator is not attained, nor are they few in which his real wishes are thwarted. In many cases the bequests are so used as to become only monuments of his folly . . .

There remains, then, only one mode of using great fortunes; but in this we have the true antidote for the temporary unequal distribution of wealth, the reconciliation of the rich and the poor—a reign of harmony—another ideal, differing, indeed, from that of the Communist in requiring only the further evolution of existing conditions, not the total overthrow of our civilization. It is founded upon the present most intense individualism, and the race is prepared to put it in practice by degrees whenever it pleases. Under its sway we shall have an ideal state, in which the surplus wealth of the few will become, in the best sense, the property of the many, because administered for the common good; and this wealth, passing through the hands of the few, can be made a much more potent force for the elevation of our race than if it had been distributed in small sums to the people themselves. Even the poorest can be made to see this, and to agree that great sums gathered by some of their fellow-citizens and spent for public purposes, from which the masses reap the principal benefit, are more

valuable to them than if scattered among them through the course of many years in trifling amounts.

If we consider what results flow from the Cooper Institute, for instance, to the best portion of the race in New York not possessed of means, and compare these with those which would have arisen for the good of the masses from an equal sum distributed by Mr. Cooper in his lifetime in the form of wages, which is the highest form of distribution, being for work done and not for charity, we can form some estimate of the possibilities for the improvement of the race which lie embedded in the present law of the accumulation of wealth. Much of this sum, if distributed in small quantities among the people, would have been wasted in the indulgence of appetite, some of it in excess; and it may be doubted whether even the part put to the best use, that of adding to the comforts of the home, would have yielded results for the race, as a race, at all comparable to those which are flowing and are to flow from the Cooper Institute from generation to generation. Let the advocate of violent or radical change ponder well this thought.

We might even go so far as to take another instance, that of Mr. Tilden's bequest of five millions of dollars for a free library in the city of New York; but in referring to this one cannot help saying involuntarily, How much better if Mr. Tilden had devoted the last years of his own life to the proper administration of this immense sum; in which case neither legal contest nor any other cause of delay could have interfered with his aims. But let us assume that Mr. Tilden's millions finally become the means of giving to this city a noble public library, where the treasures of the world contained in books will be open to all forever, without money and without price. Considering the good of that part of the race which congregates in and around Manhattan Island, would its permanent benefit have been better promoted had these millions been allowed to circulate in small sums through the hands of the masses? Even the most strenuous advocate of Communism must entertain a doubt upon this subject. Most of those who think will probably entertain no doubt whatever.

Poor and restricted are our opportunities in this life; narrow our horizon; our best work most imperfect; but rich men should be thankful for one inestimable boon. They have it in their power during their lives to busy themselves in organizing benefactions from which the masses of their fellows will derive lasting advantage, and thus dignify their own lives. The highest life is probably to be reached, not by such imitation of the life of Christ as Count Tolstoi gives us, but, while animated by Christ's spirit, by recognizing the changed conditions of this age, and adopting modes of expressing this spirit suitable to the changed conditions under which we live; still laboring for the good of our fellows, which was the essence of his life and teaching, but laboring in a different manner.

This, then, is held to be the duty of the man of Wealth: First, to set an example of modest, unostentatious living, shunning display or extravagance; to provide moderately for the legitimate wants of those dependent upon him; and after doing so to consider all surplus revenues which come to him simply as trust funds, which he is called upon to administer, and strictly bound as a matter of duty to administer in the manner which, in his judgment, is best calculated to produce the most beneficial results for the community—the man of wealth thus becoming the mere agent and trustee for his poorer brethren, bringing to their service his superior wisdom, experience, and ability to administer, doing for them better than they would or could do for themselves . . .

The best uses to which surplus wealth can be put have already been indicated. Those who would administer wisely must, indeed, be wise, for one of the serious obstacles to the improvement of our race is indiscriminate charity. It were better for mankind that the millions of the rich were thrown into the sea than so spent as to encourage the slothful, the drunken, the unworthy. Of every thousand dollars spent in so called charity to-day, it is probable that \$950 is unwisely spent; so spent, indeed, as to produce the very evils which it proposes to mitigate or cure. A well-known writer of philosophic books admitted the other day that he had given a quarter of a dollar to a man who approached him as he was coming to visit the house of his friend. He knew nothing of the habits of this beggar, knew not the use that would be made of this money, although he had every reason to suspect that it would be spent improperly. This man professed to be a disciple of Herbert Spencer; yet the quarter-dollar given that night will probably work more injury than all the money which its thoughtless donor will ever be able to give in true charity will do good. He only gratified his own feelings, saved himself from annoyance—and this was probably one of the most selfish and very worst actions of his life, for in all respects he is most worthy.

In bestowing charity, the main consideration should be to help those who will help themselves; to provide part of the means by which those who desire to improve may do so; to give those who desire to rise the aids by which they may rise; to assist, but rarely or never to do all. Neither the individual nor the race is improved by alms-giving. Those worthy of assistance, except in rare cases, seldom require assistance; the really valuable men of the race never do, except in cases of accident or sudden change. Every one has, of course, cases of individuals brought to his own knowledge where temporary assistance can do genuine good, and these he will not overlook. But the amount which can be wisely given by the individual for individuals is necessarily limited by his lack of knowledge of the circumstances connected with each. He is the only true reformer who is as careful and as anxious not to aid the unworthy as

he is to aid the worthy, and, perhaps, even more so, for in alms-giving more injury is probably done by rewarding vice than by relieving virtue.

The rich man is thus almost restricted to following the examples of Peter Cooper, Enoch Pratt of Baltimore, Mr. Pratt of Brooklyn, Senator Stanford, and others, who know that the best means of benefiting the community is to place within its reach the ladders upon which the aspiring can rise—parks, and means of recreation, by which men are helped in body and mind; works of art, certain to give pleasure and improve the public taste, and public institutions of various kinds, which will improve the general condition of the people—in this manner returning their surplus wealth to the mass of their fellows in the forms best calculated to do them lasting good.

Thus is the problem of Rich and Poor to be solved. The laws of accumulation will be left free; the laws of distribution free. Individualism will continue, but the millionaire will be but a trustee for the poor; intrusted for a season with a great part of the increased wealth of the community, but administering it for the community far better than it could or would have done for itself. The best minds will thus have reached a stage in the development of the race in which it is clearly seen that there is no mode of disposing of surplus wealth creditable to thoughtful and earnest men into whose hands it flows save by using it year by year for the general good. This day already dawns. But a little while, and although, without incurring the pity of their fellows, men may die sharers in great business enterprises from which their capital cannot be or has not been withdrawn, and is left chiefly at death for public uses; yet the man who dies leaving behind him millions of available wealth, which was his to administer during life, will pass away “unwept, unhonored, and unsung,” no matter to what uses he leaves the dross which he cannot take with him. Of such as these the public verdict will then be: “The man who dies thus rich dies disgraced.”

Such, in my opinion, is the true Gospel concerning Wealth, obedience to which is destined some day to solve the problem of the Rich and the Poor, and to bring “Peace on earth, among men Good-Will.”

## How the Other Half Lives (1890)

Jacob A. Riis

In Erik Bruun and Jay Crosby, eds., *Our Nation's Archives: The History of the United States in Documents* (New York: Black Dog & Leventhal Publishers, 1999), pp. 451–458

The street Arab is as much of an institution in New York as Newspaper Row, to which he gravitates naturally, following his Bohemian instinct. Crowded out of the tenements to shift for himself, and quite ready to do it, he meets the host

of adventurous runaways from every State in the Union and from across the sea, whom New York attracts with a queer fascination, as it attracts older emigrants from all parts of the world. A census of the population in the Newsboys' Lodging-house on any night will show such an odd mixture of small humanity as could hardly be got together in any other spot. It is a mistake to think that they are helpless little creatures, to be pitied and cried over because they are alone in the world. The unmerciful "guying" the good man would receive, who went to them with such a programme, would soon convince him that that sort of pity was wasted, and would very likely give him the idea that they were a set of hardened little scoundrels, quite beyond the reach of missionary effort.

But that would only be his second mistake. The Street Arab has all the faults and all the virtues of the lawless Life he leads. Vagabond that he is, acknowledging no authority and owing no allegiance to anybody or anything, with his grimy fist raised against society whenever it tries to coerce him, he is as bright and sharp as the weasel, which, among all the predatory beasts, he most resembles. His sturdy independence, love of freedom and absolute self-reliance, together with his rude sense of justice that enables him to govern his little community, not always in accordance with municipal law or city ordinances, but often a good deal closer to the saving line of "doing to others as one would be done by"—these are strong handles by which those who know how can catch the boy and make him useful. Successful bankers, clergymen, and lawyers all over the country, statesmen in some instances of national repute, bear evidence in their lives to the potency of such missionary efforts. There is scarcely a learned profession, or branch of honorable business, that has not in the last twenty years borrowed some of its brightest light from the poverty and gloom of New York's streets.

Anyone, whom business or curiosity has taken through Park Row or across Printing House Square in the midnight hour, when the air is filled with the roar of great presses spinning with printers' ink on endless rolls of white paper the history of the world in twenty-four hours that have just passed away, has seen little groups of these boys hanging about the newspaper offices; in winter, when snow is on the streets, fighting for warm spots around the grated vent-holes that let out the heat and steam from the underground rooms with their noise and clatter, and in summer playing craps and 7-11 on the curb for their hard-earned pennies, with all the absorbing concern of hardened gamblers. This is their beat. Here the agent for the Society for the Prevention of Cruelty to Children finds those he thinks too young for "business," but does not always capture them. Like rabbits in their burrows, the little ragamuffins sleep with at least one eye open, and every sense alert to the approach of danger: of their enemy, the policeman, whose

chief business in life is to move them on, and of the agent bent on robbing them of their cherished freedom. At the first warning shot they scatter and are off. To pursue them would be like chasing the fleet-footed mountain goat in his rocky fastnesses.

## Sherman Antitrust Act of 1890

*United States Statutes at Large* (51st Cong., 2d sess., chap. 647), pp. 209–210

### An Act

*To protect trade and commerce against unlawful restraints and monopolies.*

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,*

Sec. 1. Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is hereby declared to be illegal. Every person who shall make any such contract or engage in any such combination or conspiracy, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 2. Every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nations, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 3. Every contract, combination in form of trust or otherwise, or conspiracy, in restraint of trade or commerce in any Territory of the United States or of the District of Columbia, or in restraint of trade or commerce between any such Territory and another, or between any such Territory or Territories and any State or States or the District of Columbia, or with foreign nations, or between the District of Columbia and any State or States or foreign nations, is hereby declared illegal. Every person who shall make any such contract or engage in any such combination or conspiracy, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 4. The several circuit courts of the United States are hereby invested with jurisdiction to prevent and restrain violations of this act; and it shall be the duty of the several

district attorneys of the United States, in their respective districts, under the direction of the Attorney-General, to institute proceedings in equity to prevent and restrain such violations. Such proceedings may be by way of petition setting forth the case and praying that such violation shall be enjoined or otherwise prohibited. When the parties complained of shall have been duly notified of such petition the court shall proceed, as soon as may be, to the hearing and determination of the case; and pending such petition and before final decree, the court may at any time make such temporary restraining order or prohibition as shall be deemed just in the premises.

Sec. 5. Whenever it shall appear to the court before which any proceeding under section four of this act may be pending, that the ends of justice require that other parties should be brought before the court, the court may cause them to be summoned, whether they reside in the district in which the court is held or not; and subpoenas to that end may be served in any district by the marshal thereof.

Sec. 6. Any property owned under any contract or by any combination, or pursuant to any conspiracy (and being the subject thereof) mentioned in section one of this act, and being in the course of transportation from one State to another, or to a foreign country, shall be forfeited to the United States, and may be seized and condemned by like proceedings as those provided by law for the forfeiture, seizure, and condemnation of property imported into the United States contrary to law.

Sec. 7. Any person who shall be injured in his business or property by any other person or corporation by reason of anything forbidden or declared to be unlawful by this act, may sue therefor in any circuit court of the United States in the district in which the defendant resides or is found, without respect to the amount in controversy, and shall recover three fold the damages by him sustained, and the costs of suit, including a reasonable attorney's fee.

Sec. 8. That the word "person," or "persons," wherever used in this act shall be deemed to include corporations and associations existing under or authorized by the laws of either the United States, the laws of any of the Territories, the laws of any State, or the laws of any foreign country.

Approved, July 2, 1890.

### **"The Labor Movement Is a Fixed Fact" (May 1, 1890)**

**Samuel Gompers**

In Erik Bruun and Jay Crosby, eds., *Our Nation's Archives: The History of the United States in Documents* (New York: Black Dog & Leventhal Publishers, 1999), pp. 458–460

My friends, we have met here today to celebrate the idea that has prompted thousands of workingpeople of Louis-

ville and New Albany to parade the streets of [your city]; that prompts the toilers of Chicago to turn out by their fifty or hundred thousand men; that prompts the vast army of wageworkers in New York to demonstrate their enthusiasm and appreciation of the importance of this idea; that prompts the toilers of England, Ireland, Germany, France, Italy, Spain, and Austria to defy the manifestos of the autocrats of the world and say that on May the first, 1890, the wage-workers of the world will lay down their tools in sympathy with the wage-workers of America, to establish a principle of limitations of hours of labor to eight hours for sleep, eight hours for work, and eight hours for what we will.

It has been charged time and again that were we to have more hours of leisure we would merely devote it to debauchery, to the cultivation of vicious habits—in other words, that we would get drunk. I desire to say this in answer to that charge: As a rule, there are two classes in society who get drunk. One is the class who has no work to do, because it can't get any, and gets drunk on its face. I maintain that that class in our social life that exhibits the greatest degree of sobriety is that class who are able, by a fair number of hours of day's work to earn fair wages—not overworked. The man who works twelve, fourteen, and sixteen hours a day requires some artificial stimulation to restore the life ground out of him in the drudgery of the day. . . .

We ought to be able to discuss this question on a higher ground, and I am pleased to say that the movement in which we are engaged will stimulate us to it. They tell us that the eight-hour movement can not be enforced, for the reason that it must check industrial and commercial progress. I say that the history of this country, in its industrial and commercial relations, shows the reverse. I say that is the plane on which this question ought to be discussed—that is the social question. As long as they make this question an economic one, I am willing to discuss it with them. I would retrace every step I have taken to advance this movement did it mean industrial and commercial stagnation. But it does not mean that. It means greater prosperity; it means a greater degree of progress for the whole people; it means more advancement and intelligence, and a nobler race of people. . . .

They say they can't afford it. Is that true? Let us see for one moment. If a reduction in the hours of labor causes industrial and commercial ruination, it would naturally follow increased hours of labor would increase the prosperity, commercial and industrial. If that were true, England and America ought to be at the tail end, and China at the head of civilization.

Is it not a fact that we find laborers in England and the United States, where the hours are eight, nine and ten hours a day—do we not find that employers and laborers are more successful? Don't we find them selling articles

cheaper? We do not need to trust the modern moralist to tell us those things. In all industries where the hours of labor are long, there you will find the least development of the power of invention. Where the hours of labor are long, men are cheap, and where men are cheap there is no necessity for invention. How can you expect a man to work ten or twelve or fourteen hours at his calling and then devote any time to the invention of a machine or discovery of a new principle or force? If he be so fortunate as to be able to read a paper he will fall a sleep before he has read through the second or third line.

Why, when you reduce the hours of labor, say an hour a day, just think what it means. Suppose men who work ten hours a day had the time lessened to nine, or men who work nine hours a day have it reduced to eight hours; what does it mean. It means millions of golden hours and opportunities for thought. Some men might say you will go to sleep. Well, some men might sleep sixteen hours a day; the ordinary man might try that, but he would soon find he could not do it long. He would have to do something. He would probably go to the theater one night, to a concert another night, but could not do that every night. He would probably become interested in some study and the hours that have been taken from manual labor are devoted to mental labor, and the mental labor of one hour will produce for him more wealth than the physical labor of a dozen hours.

I maintain that this is a true proposition—that men under the short-hour system not only have opportunity to improve themselves, but to make a greater degree of prosperity for their employers. Why, my friends, how is it in China, how is it in Spain, how is it in India and Russia, how is it in Italy? Cast your eye throughout the universe and observe the industry that forces nature to yield up its fruits to man's necessities, and you will find that where the hours of labor are the shortest the progress of invention in machinery and the prosperity of the people are the greatest. It is the greatest impediment to progress to hire men cheaply. Wherever men are cheap, there you find the least degree of progress. It has only been under the great influence of our great republic, where our people have exhibited their great senses, that we can move forward, upward and onward, and are watched with interest in our movements of progress and reform. . . .

The man who works the long hours has no necessities except the barest to keep body and soul together, so he can work. He goes to sleep and dreams of work; he rises in the morning to go to work; he takes his frugal lunch to work; he comes home again to throw himself down on a miserable apology for a bed so that he can get that little rest that he may be able to go to work again. He is nothing but a veritable machine. He lives to work instead of working to live.

My friends, the only thing the working people need besides the necessities of life, is time. Time. Time with

which our lives begin; time with which our lives close; time to cultivate the better nature within us; time to brighten our homes. Time, which brings us from the lowest condition up to the highest civilization; time, so that we can raise men to a higher plane.

My friends, you will find that it has been ascertained that there is more than a million brothers and sisters—able-bodied men and women—on the streets, and on the highways and byways of our country willing to work but cannot find it. You know that it is the theory of our government that we can work or cease to work at will. It is only a theory. You know that it is only a theory and not a fact. It is true that we can cease to work when we want to, but I deny that we can work when we will, so long as there are a million idle men and women tramping the streets of our cities, searching for work. The theory that we can work or cease to work when we will is a delusion and a snare. It is a lie.

What we want to consider is, first, to make our employment more secure, and, secondly, to make wages more permanent, and, thirdly, to give these poor people a chance to work. The laborer has been regarded as a mere producing machine . . . but the back of labor is the soul of man and honesty of purpose and aspiration. Now you can not, as the political economists and college professors [do], say that labor is a commodity to be bought and sold. I say we are American citizens with the heritage of all the great men who have stood before us; men who have sacrificed all in the cause except honor. Our enemies would like to see this movement thrust into Hades, they would like to see it in a warmer climate, but I say to you that this labor movement has come to stay. Like Banquo's ghost, it will not stay down. I say the labor movement is a fixed fact. It has grown out of the necessities of the people, and, although some may desire to see it fail, still the labor movement will be found to have a strong lodgment in the hearts of the people, and we will go on until success has been achieved.

We want eight hours and nothing less. We have been accused of being selfish, and it has been said that we will want more; that last year we got an advance of ten cents and now we want more. We do want more. You will find that a man generally wants more. Go and ask a tramp what he wants, and if he doesn't want a drink, he wants a good, square meal. You ask a workingman, who is getting two dollars a day, and he will say that he wants ten cents more. Ask a man who gets five dollars a day and he will want fifty cents more. The man who receives five thousand dollars a year wants six thousand dollars a year, and the man who owns eight or nine hundred thousand dollars will want a hundred thousand dollars more to make it a million, while the man who has his millions will want everything he can lay his hands on and then raise his voice against the poor devil who wants ten cents more a day. We live in the latter part of the nineteenth century. In the age of electricity

and steam that has produced wealth a hundred fold, we insist that it has been brought about by the intelligence and energy of the workingmen, and while we find that is now easier to produce it is harder to live. We do want more, and when it becomes more, we shall still want more. And we shall never cease to demand more until we have received the results of our labor.

### Populist Party Platform, 1892

In Henry Steele Commager and Milton Cantor, eds., *Documents of American History*, Vol. 1 (Englewood Cliffs, N.J.: Prentice Hall, 1988)

#### Populist Party Platform

Assembled upon the 116th anniversary of the Declaration of Independence, the People's Party of America, in their first national convention, invoking upon their action the blessing of Almighty God, put forth in the name and on behalf of the people of this country, the following preamble and declaration of principles:

#### Preamble

The conditions which surround us best justify our cooperation; we meet in the midst of a nation brought to the verge of moral, political, and material ruin. Corruption dominates the ballot-box, the Legislatures, the Congress, and touches even the ermine of the bench. The people are demoralized; most of the States have been compelled to isolate the voters at the polling places to prevent universal intimidation and bribery. The newspapers are largely subsidized or muzzled, public opinion silenced, business prostrated, homes covered with mortgages, labor impoverished, and the land concentrating in the hands of capitalists. The urban workmen are denied the right to organize for self-protection, imported pauperized labor beats down their wages, a hiring standing army, unrecognized by our laws, is established to shoot them down, and they are rapidly degenerating into European conditions. The fruits of the toil of millions are boldly stolen to build up colossal fortunes for a few, unprecedented in the history of mankind; and the possessors of these, in turn, despise the Republic and endanger liberty. From the same prolific womb of governmental injustice we breed the two great classes—tramps and millionaires.

The national power to create money is appropriated to enrich bond-holders; a vast public debt payable in legal-tender currency has been funded into gold-bearing bonds, thereby adding millions to the burdens of the people.

Silver, which has been accepted as coin since the dawn of history, has been demonetized to add to the purchasing power of gold by decreasing the value of all forms of property as well as human labor, and the supply of currency is

purposely abridged to fatten usurers, bankrupt enterprise, and enslave industry. A vast conspiracy against mankind has been organized on two continents, and it is rapidly taking possession of the world. If not met and overthrown at once it forebodes terrible social convulsions, the destruction of civilization, or the establishment of an absolute despotism.

We have witnessed for more than a quarter of a century the struggles of the two great political parties for power and plunder, while grievous wrongs have been inflicted upon the suffering people. We charge that the controlling influences dominating both these parties have permitted the existing dreadful conditions to develop without serious effort to prevent or restrain them. Neither do they now promise us any substantial reform. They have agreed together to ignore, in the coming campaign, every issue but one. They propose to drown the outcries of a plundered people with the uproar of a sham battle over the tariff, so that capitalists, corporations, national banks, rings, trusts, watered stock, the demonetization of silver and the oppressions of the usurers may all be lost sight of. They propose to sacrifice our homes, lives, and children on the altar of mammon; to destroy the multitude in order to secure corruption funds from the millionaires.

Assembled on the anniversary of the birthday of the nation, and filled with the spirit of the grand general and chief who established our independence, we seek to restore the government of the Republic to the hands of the "plain people," with which class it originated. We assert our purposes to be identical with the purposes of the National Constitution; to form a more perfect union and establish justice, insure domestic tranquillity, provide for the common defence, promote the general welfare, and secure the blessings of liberty for ourselves and our posterity.

We declare that this Republic can only endure as a free government while built upon the love of the people for each other and for the nation; that it cannot be pinned together by bayonets; that the Civil War is over, and that every passion and resentment which grew out of it must die with it, and that we must be in fact, as we are in name, one united brotherhood of free men.

Our country finds itself confronted by conditions for which there is no precedent in the history of the world; our annual agricultural productions amount to billions of dollars in value, which must, within a few weeks or months, be exchanged for billions of dollars' worth of commodities consumed in their production; the existing currency supply is wholly inadequate to make this exchange; the results are falling prices, the formation of combines and rings, the impoverishment of the producing class. We pledge ourselves that if given power we will labor to correct these evils by wise and reasonable legislation, in accordance with the terms of our platform.

We believe that the power of government—in other words, of the people—should be expanded (as in the case of the postal service) as rapidly and as far as the good sense of an intelligent people and the teachings of experience shall justify, to the end that oppression, injustice, and poverty shall eventually cease in the land.

While our sympathies as a party of reform are naturally upon the side of every proposition which will tend to make men intelligent, virtuous, and temperate, we nevertheless regard these questions, important as they are, as secondary to the great issues now pressing for solution, and upon which not only our individual prosperity but the very existence of free institutions depend; and we ask all men to first help us to determine whether we are to have a republic to administer before we differ as to the conditions upon which it is to be administered, believing that the forces of reform this day organized will never cease to move forward until every wrong is righted and equal rights and equal privileges securely established for all the men and women of this country.

### Platform

We declare, therefore —

First.—That the union of the labor forces of the United States this day consummated shall be permanent and perpetual; may its spirit enter into all hearts for the salvation of the Republic and the uplifting of mankind.

Second.—Wealth belongs to him who creates it, and every dollar taken from industry without an equivalent is robbery. “If any will not work, neither shall he eat.” The interests of rural and civil labor are the same; their enemies are identical.

Third.—We believe that the time has come when the railroad corporations will either own the people or the people must own the railroads; and should the government enter upon the work of owning and managing all railroads, we should favor an amendment to the constitution by which all persons engaged in the government service shall be placed under a civil-service regulation of the most rigid character, so as to prevent the increase of the power of the national administration by the use of such additional government employees.

Finance.—We demand a national currency, safe, sound, and flexible issued by the general government only, a full legal tender for all debts, public and private, and that without the use of banking corporations; a just, equitable, and efficient means of distribution direct to the people, at a tax not to exceed 2 per cent, per annum, to be provided as set forth in the sub-treasury plan of the Farmers’ Alliance, or a better system; also by payments in discharge of its obligations for public improvements.

1. We demand free and unlimited coinage of silver and gold at the present legal ratio of 16 to 1.

2. We demand that the amount of circulating medium be speedily increased to not less than \$50 per capita.
3. We demand a graduated income tax.
4. We believe that the money of the country should be kept as much as possible in the hands of the people, and hence we demand that all State and national revenues shall be limited to the necessary expenses of the government, economically and honestly administered.
5. We demand that postal savings banks be established by the government for the safe deposit of the earnings of the people and to facilitate exchange.

Transportation.—Transportation being a means of exchange and a public necessity, the government should own and operate the railroads in the interest of the people. The telegraph and telephone, like the post-office system, being a necessity for the transmission of news, should be owned and operated by the government in the interest of the people.

Land.—The land, including all the natural sources of wealth, is the heritage of the people, and should not be monopolized for speculative purposes, and alien ownership of land should be prohibited. All land now held by railroads and other corporations in excess of their actual needs, and all lands now owned by aliens should be reclaimed by the government and held for actual settlers only.

### Expression of Sentiments

Your Committee on Platform and Resolutions beg leave unanimously to report the following:

Whereas, Other questions have been presented for our consideration, we hereby submit the following, not as a part of the Platform of the People’s Party, but as resolutions expressive of the sentiment of this Convention.

1. Resolved, That we demand a free ballot and a fair count in all elections, and pledge ourselves to secure it to every legal voter without Federal intervention, through the adoption by the States of the unperverted Australian or secret ballot system.
2. Resolved, That the revenue derived from a graduated income tax should be applied to the reduction of the burden of taxation now levied upon the domestic industries of this country.
3. Resolved, That we pledge our support to fair and liberal pensions to ex-Union soldiers and sailors.
4. Resolved, That we condemn the fallacy of protecting American labor under the present system, which opens our ports to the pauper and criminal classes of the world and crowds out our wage-earners; and we denounce the present ineffective laws against contract labor, and demand the further restriction of undesirable emigration.

5. Resolved, That we cordially sympathize with the efforts of organized workingmen to shorten the hours of labor, and demand a rigid enforcement of the existing eight-hour law on Government work, and ask that a penalty clause be added to the said law.
6. Resolved, That we regard the maintenance of a large standing army of mercenaries, known as the Pinkerton system, as a menace to our liberties, and we demand its abolition; and we condemn the recent invasion of the Territory of Wyoming by the hired assassins of plutocracy, assisted by Federal officers.
7. Resolved, That we commend to the favorable consideration of the people and the reform press the legislative system known as the initiative and referendum.
8. Resolved, That we favor a constitutional provision limiting the office of President and Vice-President to one term, and providing for the election of Senators of the United States by a direct vote of the people.
9. Resolved, That we oppose any subsidy or national aid to any private corporation for any purpose.
10. Resolved, That this convention sympathizes with the Knights of Labor and their righteous contest with the tyrannical combine of clothing manufacturers of Rochester, and declare it to be a duty of all who hate tyranny and oppression to refuse to purchase the goods made by the said manufacturers, or to patronize any merchants who sell such goods.

### Booker T. Washington's "Atlanta Compromise" Speech, September 18, 1895

In John A. Scott, ed., *Living Documents in American History*, Vol. 1 (New York: Washington Square Press, 1964-68), pp. 609-612

Mr. President and Gentlemen of the Board of Directors and Citizens:

One-third of the population of the South is of the Negro race. No enterprise seeking the material, civil, or moral welfare of this section can disregard this element of our population and reach the highest success. I but convey to you, Mr. President and Directors, the sentiment of the masses of my race when I say that in no way have the value and manhood of the American Negro been more fittingly and generously recognized than by the managers of this magnificent Exposition at every stage of its progress. It is a recognition that will do more to cement the friendship of the two races than any occurrence since the dawn of our freedom.

Not only this, but the opportunity here afforded will awaken among us a new era of industrial progress. Ignorant and inexperienced, it is not strange that in the first years of our new life we began at the top instead of at the bottom;

that a seat in Congress or the state legislature was more sought than real estate or industrial skill; that the political convention of stump speaking had more attractions than starting a dairy farm or truck garden.

A ship lost at sea for many days suddenly sighted a friendly vessel. From the mast of the unfortunate vessel was seen a signal, "Water, water; we die of thirst!" The answer from the friendly vessel at once came back, "Cast down your bucket where you are." A second time the signal, "Water, water; send us water!" ran up from the distressed vessel, and was answered, "Cast down your bucket where you are." And a third and fourth signal for water was answered, "Cast down your bucket where you are." The captain of the distressed vessel, at least heeding the injunction, cast down his bucket, and it came up full of fresh, sparkling water from the mouth of the Amazon River. To those of my race who depend on bettering their condition in a foreign land or who underestimate the importance of cultivating friendly relations with the southern white man, who is their next-door neighbour, I would say: "Cast down your bucket where you are"—cast it down in making friends in every manly way of the people of all races by whom we are surrounded.

Cast it down in agriculture, mechanics, in commerce, in domestic service, and in the professions. And in this connection it is well to bear in mind that whatever other sins the South may be called to bear, when it comes to business, pure and simple, it is in the South that the Negro is given a man's chance in the commercial world, and in nothing is this Exposition more eloquent than in emphasizing this chance. Our greatest danger is that in the great leap from slavery to freedom we may overlook the fact that the masses of us are to live by the productions of our hands, and fail to keep in mind that we shall prosper in proportion as we learn to dignify and glorify common labour and put brains and skill into the common occupations of life; shall prosper in proportion as we learn to draw the line between the superficial and the substantial, the ornamental gewgaws of life and the useful. No race can prosper till it learns that there is as much dignity in tilling a field as in writing a poem. It is at the bottom of life we must begin, and not at the top. Nor should we permit our grievances to overshadow our opportunities.

To those of the white race who look to the incoming of those of foreign birth and strange tongue and habits for the prosperity of the South, were I permitted I would repeat what I say to my own race, "Cast down your bucket where you are." Cast it down among the eight millions of Negroes whose habits you know, whose fidelity and love you have tested in days when to have proved treacherous meant the ruin of your firesides. Cast down your bucket among these people who have, without strikes and labor wars, tilled your fields, cleared your forests, builded your railroads and cit-

ies, and brought forth treasures from the bowels of the earth, and helped make possible this magnificent representation of the progress of the South. Casting down your bucket among my people, helping and encouraging them as you are doing on these grounds, and to education of head, hand, and heart, you will find that they will buy your surplus land, make blossom the waste places in your fields, and run your factories.

While doing this, you can be sure in the future, as in the past, that you and your families will be surrounded by the most patient, faithful, law-abiding, and unresentful people that the world has seen. As we have proved our loyalty to you in the past, in nursing your children, watching by the sickbed of your mothers and fathers, and often following them with tear-dimmed eyes to their graves, so in the future, in our humble way, we shall stand by you with a devotion that no foreigner can approach, ready to lay down our lives, if need be, in defence of yours, interlacing our industrial, commercial, civil, and religious life with yours in a way that shall make the interests of both races one. In all things that are purely social we can be as separate as the fingers, yet one as the hand in all things essential to mutual progress.

There is no defence or security for any of us except in the highest intelligence and development of all. If anywhere there are efforts tending to curtail the fullest growth of the Negro, let these efforts be turned into stimulating, encouraging, and making him the most useful and intelligent citizen. Effort or means so invested will pay a thousand percent interest. These efforts will be twice blessed—"blessing him that gives and him that takes."

There is no escape through law of man or God from the inevitable:

The laws of changeless justice bind Oppressor with oppressed; And close as sin and suffering joined We march to fate abreast.

Nearly sixteen millions of hands will aid you in pulling the load upward, or they will pull against you the load downward. We shall constitute one-third and more of the ignorance and crime of the South, or one-third of its intelligence and progress; we shall contribute one-third to the business and industrial prosperity of the South, or we shall prove a veritable body of death, stagnating, depressing, retarding every effort to advance the body politic.

Gentlemen of the Exposition, as we present to you our humble effort at an exhibition of our progress, you must not expect overmuch. Starting thirty years ago with ownership here and there in a few quilts and pumpkins and chickens (gathered from miscellaneous sources), remember the path that has led from these to the inventions and production of agricultural implements, buggies, steam-engines, newspapers, books, statuary, carving, paintings, the management

of drugstores and banks, has not been trodden without contact with thorns and thistles. While we take pride in what we exhibit as a result of our independent efforts, we do not for a moment forget that our part in this exhibition would fall far short of your expectations but for the constant help that has come to our educational life, not only from the southern States, but especially from northern philanthropists, who have made their gifts a constant stream of blessing and encouragement.

The wisest among my race understand that the agitation of questions of social equality is the extremest folly, and that progress in the enjoyment of all the privileges that will come to us must be the result of severe and constant struggle rather than of artificial forcing. No race that has anything to contribute to the markets of the world is long in any degree ostracized. It is important and right that all privileges of the law be ours, but it is vastly more important that we be prepared for the exercises of these privileges. The opportunity to earn a dollar in a factory just now is worth infinitely more than the opportunity to spend a dollar in an opera-house.

In conclusion, may I repeat that nothing in thirty years has given us more hope and encouragement, and drawn us so near to you of the white race, as this opportunity offered by the Exposition; here bending, as it were, over the altar that represents the results of the struggles of your race and mine, both starting practically empty-handed three decades ago, I pledge that in your effort to work out the great and intricate problem which God has laid at the doors of the South, you shall have at all times the patient, sympathetic help of my race. Only let this be constantly in mind, that, while from representations in these buildings of the product of field, of forest, of mine, of factory, letters, and art, much good will come, yet far above and beyond material benefits will be that higher good, that, let us pray God, will come, in a blotting out of sectional differences and racial animosities and suspicions, and in a determination to administer absolute justice, even in the remotest corner; in a willing obedience among all classes to the mandates of law and a spirit that will tolerate nothing but the highest equity in the enforcement of law. This, then, coupled with our material prosperity, will bring into our beloved South a new heaven and a new earth.

### ***Plessy v. Ferguson* (May 18, 1896) U.S. Supreme Court**

163 U.S. 537 (1896). In *Supreme Court Reporter*, Vol. 16, pp. 1,138–1,148 (163 U.S. 537).

Mr. Justice Henry B. Brown for the majority:

This case turns upon the constitutionality of an act of the general assembly of the state of Louisiana, passed in

1890, providing for separate railway carriages for the white and colored races. . . .

The constitutionality of this act is attacked upon the ground that it conflicts both with the thirteenth amendment of the constitution, abolishing slavery, and the fourteenth amendment, which prohibits certain restrictive legislation on the part of the states.

1. That it does not conflict with the thirteenth amendment, which abolished slavery and involuntary servitude, except as a punishment for crime, is too clear for argument. . . .

A statute which implies merely a legal distinction between the white and colored races—a distinction which is founded in the color of the two races, and which must always exist so long as white men are distinguished from the other race by color—has no tendency to destroy the legal equality of the two races, or re-establish a state of involuntary servitude. Indeed, we do not understand that the thirteenth amendment is strenuously relied upon by the plaintiff in error in this connection. . . .

The object of the amendment was undoubtedly to enforce the absolute equality of the two races before the law, but, in the nature of things, it could not have been intended to abolish distinctions based upon color, or to enforce social, as distinguished from political, equality, or a commingling of the two races upon terms unsatisfactory to either. Laws permitting, and even requiring, their separation, in places where they are liable to be brought into contact, do not necessarily imply the inferiority of either race to the other, and have been generally, if not universally, recognized as within the competency of the state legislatures in the exercise of their police power. The most common instance of this is connected with the establishment of separate schools for white and colored children, which have been held to be a valid exercise of the legislative power even by courts of states where the political rights of the colored race have been longest and most earnestly enforced. . . .

It is claimed by the plaintiff in error that, in any mixed community, the reputation of belonging to the dominant race, in this instance the white race, is “property,” in the same sense that a right of action or of inheritance is property. Conceding this to be so, for the purposes of this case, we are unable to see how this statute deprives him of, or in any way affects his right to, such property. If he be a white man, and assigned to a colored coach, he may have his action for damages against the company for being deprived of his so-called “property.” Upon the other hand, if he be a colored man, and be so assigned, he has been deprived of no property, since he is not lawfully entitled to the reputation of being a white man. . . .

So far, then, as a conflict with the fourteenth amendment is concerned, the case reduces itself to the question whether the statute of Louisiana is a reasonable regulation, and with respect to this there must necessarily be a large discretion on the part of the legislature. In determining the question of reasonableness, it is at liberty to act with reference to the established usages, customs, and traditions of the people, and with a view to the promotion of their comfort, and the preservation of the public peace and good order. Gauged by this standard, we cannot say that a law which authorizes or even requires the separation of the two races in public conveyances is unreasonable, or more obnoxious to the fourteenth amendment than the acts of Congress requiring separate schools for colored children in the District of Columbia, the constitutionality of which does not seem to have been questioned, or the corresponding acts of state legislatures.

We consider the underlying fallacy of the plaintiff’s argument to consist in the assumption that the enforced separation of the two races stamps the colored race with a badge of inferiority. If this be so, it is not by reason of anything found in the act, but solely because the colored race chooses to put that construction upon it. The argument necessarily assumes that if, as has been more than once the case, and is not unlikely to be so again, the colored race should become the dominant power in the state legislature, and should enact a law in precisely similar terms, it would thereby relegate the white race to an inferior position. We imagine that the white race, at least, would not acquiesce in this assumption. The argument also assumes that social prejudices may be overcome by legislation, and that equal rights cannot be secured to the negro except by an enforced commingling of the two races. We cannot accept this proposition. If the two races are to meet upon terms of social equality, it must be the result of natural affinities, a mutual appreciation of each other’s merits, and a voluntary consent of individuals. As was said by the court of appeals of New York in *People v. Gallagher*, 93 N. Y. 438, 448: “This end can neither be accomplished nor promoted by laws which conflict with the general sentiment of the community upon whom they are designed to operate. When the government, therefore, has secured to each of its citizens equal rights before the law, and equal opportunities for improvement and progress, it has accomplished the end for which it was organized, and performed all of the functions respecting social advantages with which it is endowed.” Legislation is powerless to eradicate racial instincts, or to abolish distinctions based upon physical differences, and the attempt to do so can only result in accentuating the difficulties of the present situation. If the civil and political rights of both races be equal, one cannot be inferior to the other civilly or politically. If one race be inferior to the other socially, the constitution of the United States cannot put them upon the same plane. . . .

Mr. Justice Harlan dissenting.

... In respect of civil rights, common to all citizens, the constitution of the United States does not, I think, permit any public authority to know the race of those entitled to be protected in the enjoyment of such rights. Every true man has pride of race, and under appropriate circumstances, when the rights of others, his equals before the law, are not to be affected, it is his privilege to express such pride and to take such action based upon it as to him seems proper. But I deny that any legislative body or judicial tribunal may have regard to the race of citizens when the civil rights of those citizens are involved. Indeed, such legislation as that here in question is inconsistent not only with that equality of rights which pertains to citizenship, national and state, but with the personal liberty enjoyed by every one within the United States.

The thirteenth amendment does not permit the withholding or the deprivation of any right necessarily inhering in freedom. It not only struck down the institution of slavery as previously existing in the United States, but it prevents the imposition of any burdens or disabilities that constitute badges of slavery or servitude. It decreed universal civil freedom in this country. This court has so adjudged. But, that amendment having been found inadequate to the protection of the rights of those who had been in slavery, it was followed by the fourteenth amendment, which added greatly to the dignity and glory of American citizenship, and to the security of personal liberty, by declaring that "all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the state wherein they reside," and that "no state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws." These two amendments, if enforced according to their true intent and meaning, will protect all the civil rights that pertain to freedom and citizenship. Finally, and to the end that no citizen should be denied, on account of his race, the privilege of participating in the political control of his country, it was declared by the fifteenth amendment that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color or previous condition of servitude."

These notable additions to the fundamental law were welcomed by the friends of liberty throughout the world. They removed the race line from our governmental systems. They had, as this court has said, a common purpose, namely, to secure "to a race recently emancipated, a race that through many generations have been held in slavery, all the civil rights that the superior race enjoy." They declared, in legal effect, this court has further said, "that

the law in the states shall be the same for the black as for the white; that all persons, whether colored or white, shall stand equal before the laws of the states; and in regard to the colored race, for whose protection the amendment was primarily designed, that no discrimination shall be made against them by law because of their color." We also said: "The words of the amendment, it is true, are prohibitory, but they contain a necessary implication of a positive immunity or right, most valuable to the colored race,—the right to exemption from unfriendly legislation against them distinctively as colored; exemption from legal discriminations, implying inferiority in civil society, lessening the security of their enjoyment of the rights which others enjoy; and discriminations which are steps towards reducing them to the condition of a subject race." It was, consequently, adjudged that a state law that excluded citizens of the colored race from juries, because of their race, however well qualified in other respects to discharge the duties of jurymen, was repugnant to the fourteenth amendment. *Strauder v. West Virginia*, 100 U.S. 303, 306, 307; *Virginia v. Rives*, Id. 313; *Ex parte Virginia*, Id. 339; *Neal v. Delaware*, 103 U.S. 370, 386; *Bush v. Com.*, 107 U.S. 110, 116, 1 Sup. Ct. 625. At the present term, referring to the previous adjudications, this court declared that "underlying all of those decisions is the principle that the constitution of the United States, in its present form, forbids, so far as civil and political rights are concerned, discrimination by the general government or the states against any citizen because of his race. All citizens are equal before the law." *Gibson v. State*, 162 U.S. 565, 16 Sup. Ct. 904.

The decisions referred to show the scope of the recent amendments of the constitution. They also show that it is not within the power of a state to prohibit colored citizens, because of their race, from participating as jurors in the administration of justice.

It was said in argument that the statute of Louisiana does not discriminate against either race, but prescribes a rule applicable alike to white and colored citizens. But this argument does not meet the difficulty. Every one knows that the statute in question had its origin in the purpose, not so much to exclude white persons from railroad cars occupied by blacks, as to exclude colored people from coaches occupied by or assigned to white persons. Railroad corporations of Louisiana did not make discrimination among whites in the matter of accommodation for travelers. The thing to accomplish was, under the guise of giving equal accommodation for whites and blacks, to compel the latter to keep to themselves while traveling in railroad passenger coaches. No one would be so wanting in candor as to assert the contrary. The fundamental objection, therefore, to the statute, is that it interferes with the personal freedom of citizens. "Personal liberty," it has been well said, "consists in the power of locomotion, of changing situation, or removing one's person to

whatsoever places one's own inclination may direct, without imprisonment or restraint, unless by due course of law." 1 Bl. Comm. 134. If a white man and a black man choose to occupy the same public conveyance on a public highway, it is their right to do so; and no government, proceeding alone on grounds of race, can prevent it without infringing the personal liberty of each.

It is one thing for railroad carriers to furnish, or to be required by law to furnish, equal accommodations for all whom they are under a legal duty to carry. It is quite another thing for government to forbid citizens of the white and black races from traveling in the same public conveyance, and to punish officers of railroad companies for permitting persons of the two races to occupy the same passenger coach. If a state can prescribe, as a rule of civil conduct, that whites and blacks shall not travel as passengers in the same railroad coach, why may it not so regulate the use of the streets of its cities and towns as to compel white citizens to keep on one side of a street, and black citizens to keep on the other? Why may it not, upon like grounds, punish whites and blacks who ride together in street cars or in open vehicles on a public road or street? Why may it not require sheriffs to assign whites to one side of a court room, and blacks to the other? And why may it not also prohibit the commingling of the two races in the galleries of legislative halls or in public assemblages convened for the consideration of the political questions of the day? Further, if this statute of Louisiana is consistent with the personal liberty of citizens, why may not the state require the separation in railroad coaches of native and naturalized citizens of the United States, or of Protestants and Roman Catholics?

The answer given at the argument to these questions was that regulations of the kind they suggest would be unreasonable, and could not, therefore, stand before the law. Is it meant that the determination of questions of legislative power depends upon the inquiry whether the statute whose validity is questioned is, in the judgment of the courts, a reasonable one, taking all the circumstances into consideration? A statute may be unreasonable merely because a sound public policy forbade its enactment. But I do not understand that the courts have anything to do with the policy or expediency of legislation. A statute may be valid, and yet, upon grounds of public policy, may well be characterized as unreasonable. Mr. Sedgwick correctly states the rule when he says that, the legislative intention being clearly ascertained, "the courts have no other duty to perform than to execute the legislative will, without any regard to their views as to the wisdom or justice of the particular enactment." Sedg. St. & Const. Law, 324. There is a dangerous tendency in these latter days to enlarge the functions of the courts; by means of judicial interference with the will of the people as expressed by the legislature.

Our institutions have the distinguishing characteristic that the three departments of government are co-ordinate and separate. Each must keep within the limits defined by the constitution. And the courts best discharge their duty by executing the will of the lawmaking power, constitutionally expressed, leaving the results of legislation to be dealt with by the people through their representatives. Statutes must always have a reasonable construction. Sometimes they are to be construed strictly, sometimes literally, in order to carry out the legislative will. But, however construed, the intent of the legislature is to be respected if the particular statute in question is valid, although the courts, looking at the public interests, may conceive the statute to be both unreasonable and impolitic. If the power exists to enact a statute, that ends the matter so far as the courts are concerned. The adjudged cases in which statutes have been held to be void, because unreasonable, are those in which the means employed by the legislature were not at all germane to the end to which the legislature was competent.

The white race deems itself to be the dominant race in the country. And so it is, in prestige, in achievements, in education, in wealth, and in power. So, I doubt not, it will continue to be for all time, if it remains true to its great heritage, and holds fast to the principles of constitutional liberty. But in view of the constitution, in the eye of the law, there is in this country no superior, dominant, ruling class of citizens. There is no caste here. Our constitution is color-blind, and neither knows nor tolerates classes among citizens. In respect of civil rights, all citizens are equal before the law. The humblest is the peer of the most powerful. The law regards man as man, and takes no account of his surroundings or of his color when his civil rights as guaranteed by the supreme law of the land are involved. It is therefore to be regretted that this high tribunal, the final expositor of the fundamental law of the land, has reached the conclusion that it is competent for a state to regulate the enjoyment by citizens of their civil rights solely upon the basis of race.

In my opinion, the judgment this day rendered will, in time, prove to be quite as pernicious as the decision made by this tribunal in the *Dred Scott* Case.

It was adjudged in that case that the descendants of Africans who were imported into this country, and sold as slaves, were not included nor intended to be included under the word "citizens" in the constitution, and could not claim any of the rights and privileges which that instrument provided for and secured to citizens of the United States; that, at the time of the adoption of the constitution, they were "considered as a subordinate and inferior class of beings, who had been subjugated by the dominant race, and, whether emancipated or not, yet remained subject to their authority, and had no rights or privileges but

such as those who held the power and the government might choose to grant them.” 17 How. 393, 404. The recent amendments of the constitution, it was supposed, had eradicated these principles from our institutions. But it seems that we have yet, in some of the states, a dominant race,—a superior class of citizens,—which assumes to regulate the enjoyment of civil rights, common to all citizens, upon the basis of race. The present decision, it may well be apprehended, will not only stimulate aggressions, more or less brutal and irritating, upon the admitted rights of colored citizens, but will encourage the belief that it is possible, by means of state enactments, to defeat the beneficent purposes which the people of the United States had in view when they adopted the recent amendments of the constitution, by one of which the blacks of this country were made citizens of the United States and of the states in which they respectively reside, and whose privileges and immunities, as citizens, the states are forbidden to abridge. Sixty millions of whites are in no danger from the presence here of eight millions of blacks. The destinies of the two races, in this country, are indissolubly linked together, and the interests of both require that the common government of all shall not permit the seeds of race hate to be planted under the sanction of law. What can more certainly arouse race hate, what more certainly create and perpetuate a feeling of distrust between these races, than state enactments which, in fact, proceed on the ground that colored citizens are so inferior and degraded that they cannot be allowed to sit in public coaches occupied by white citizens? That, as all will admit, is the real meaning of such legislation as was enacted in Louisiana.

The sure guaranty of the peace and security of each race is the clear, distinct, unconditional recognition by our governments, national and state, of every right that inheres in civil freedom, and of the equality before the law of all citizens of the United States, without regard to race. State enactments regulating the enjoyment of civil rights upon the basis of race, and cunningly devised to defeat legitimate results of the war, under the pretense of recognizing equality of rights, can have no other result than to render permanent peace impossible, and to keep alive a conflict of races, the continuance of which must do harm to all concerned. This question is not met by the suggestion that social equality cannot exist between the white and black races in this country. That argument, if it can be properly regarded as one, is scarcely worthy of consideration; for social equality no more exists between two races when traveling in a passenger coach or a public highway than when members of the same races sit by each other in a street car or in the jury box, or stand or sit with each other in a political assembly, or when they use in common the streets of a city or town, or when they are in the same room for the purpose of having their names placed on the registry of voters, or when

they approach the ballot box in order to exercise the high privilege of voting.

There is a race so different from our own that we do not permit those belonging to it to become citizens of the United States. Persons belonging to it are, with few exceptions, absolutely excluded from our country. I allude to the Chinese race. But, by the statute in question, a Chinaman can ride in the same passenger coach with white citizens of the United States, while citizens of the black race in Louisiana, many of whom, perhaps, risked their lives for the preservation of the Union, who are entitled, by law, to participate in the political control of the state and nation, who are not excluded, by law or by reason of their race, from public stations of any kind, and who have all the legal rights that belong to white citizens, are yet declared to be criminals, liable to imprisonment, if they ride in a public coach occupied by citizens of the white race. It is scarcely just to say that a colored citizen should not object to occupying a public coach assigned to his own race. He does not object, nor, perhaps, would he object to separate coaches for his race if his rights under the law were recognized. But he does object, and he ought never to cease objecting, that citizens of the white and black races can be adjudged criminals because they sit, or claim the right to sit, in the same public coach on a public highway.

The arbitrary separation of citizens, on the basis of race, while they are on a public highway, is a badge of servitude wholly inconsistent with the civil freedom and the equality before the law established by the constitution. It cannot be justified upon any legal grounds.

If evils will result from the commingling of the two races upon public highways established for the benefit of all, they will be infinitely less than those that will surely come from state legislation regulating the enjoyment of civil rights upon the basis of race. We boast of the freedom enjoyed by our people above all other peoples. But it is difficult to reconcile that boast with a state of the law which, practically, puts the brand of servitude and degradation upon a large class of our fellow citizens,—our equals before the law. The thin disguise of “equal” accommodations for passengers in railroad coaches will not mislead any one, nor atone for the wrong this day done.

The result of the whole matter is that while this court has frequently adjudged, and at the present term has recognized the doctrine, that a state cannot, consistently with the constitution of the United States, prevent white and black citizens, having the required qualifications for jury service, from sitting in the same jury box, it is now solemnly held that a state may prohibit white and black citizens from sitting in the same passenger coach on a public highway, or may require that they be separated by a “partition” when in the same passenger coach. May it not now be reasonably expected that astute men of the dominant race, who affect

to be disturbed at the possibility that the integrity of the white race may be corrupted, or that its supremacy will be imperiled, by contact on public highways with black people, will endeavor to procure statutes requiring white and black jurors to be separated in the jury box by a "partition," and that, upon retiring from the court room to consult as to their verdict, such partition, if it be a movable one, shall be taken to their consultation room, and set up in such way as to prevent black jurors from coming too close to their brother jurors of the white race. If the "partition" used in the court room happens to be stationary, provision could be made for screens with openings through which jurors of the two races could confer as to their verdict without coming into personal contact with each other. I cannot see but that, according to the principles this day announced, such state legislation, although conceived in hostility to, and enacted for the purpose of humiliating, citizens of the United States of a particular race, would be held to be consistent with the constitution.

I do not deem it necessary to review the decisions of state courts to which reference was made in argument. Some, and the most important, of them, are wholly inapplicable, because rendered prior to the adoption of the last amendments of the constitution, when colored people had very few rights which the dominant race felt obliged to respect. Others were made at a time when public opinion, in many localities, was dominated by the institution of slavery; when it would not have been safe to do justice to the black man; and when, so far as the rights of blacks were concerned, race prejudice was, practically, the supreme law of the land. Those decisions cannot be guides in the era introduced by the recent amendments of the supreme law, which established universal civil freedom, gave citizenship to all born or naturalized in the United States, and residing here, obliterated the race line from our systems of governments, national and state, and placed our free institutions upon the broad and sure foundation of the equality of all men before the law.

I am of opinion that the statute of Louisiana is inconsistent with the personal liberty of citizens, white and black, in that state, and hostile to both the spirit and letter of the constitution of the United States. If laws of like character should be enacted in the several states of the Union, the effect would be in the highest degree mischievous. Slavery, as an institution tolerated by law, would, it is true, have disappeared from our country; but there would remain a power in the states, by sinister legislation, to interfere with the full enjoyment of the blessings of freedom, to regulate civil rights, common to all citizens, upon the basis of race, and to place in a condition of legal inferiority a large body of American citizens, now constituting a part of the political community, called the "People of the United States," for whom, and by whom through representatives, our govern-

ment is administered. Such a system is inconsistent with the guaranty given by the constitution to each state of a republican form of government, and may be stricken down by congressional action, or by the courts in the discharge of their solemn duty to maintain the supreme law of the land, anything in the constitution or laws of any state to the contrary notwithstanding.

For the reason stated, I am constrained to withhold my assent from the opinion and judgment of the majority.

### **William Jennings Bryan's "Cross of Gold" Speech, July 9, 1896**

Collections of the Manuscript Division, Library of Congress,  
Container 49 of the Bryan Papers

#### **Cross of Gold**

Mr. Chairman and Gentlemen of the Convention: I would be presumptuous, indeed, to present myself against the distinguished gentlemen to whom you have listened if this was a mere measuring of abilities; but this is not a contest between persons. The humblest citizen in all the land, when clad in the armor of a righteous cause, is stronger than all the hosts of error. I come to speak to you in defense of a cause as holy as the cause of liberty—the cause of humanity.

When this debate is concluded a motion will be made to lay upon the table the resolution offered in commendation of the administration and also the resolution offered in condemnation of the administration. We object to bringing this question down to the level of persons. The individual is but an atom; he is born, he acts, he dies; but principles are eternal; and this has been a contest over a principle.

#### **Principles, Not Men**

Never before in the history of this country has there been witnessed such a contest as that through which we have just passed. Never before in the history of American politics has a great issue been fought out, as this issue has been, by the voters of a great party. On the fourth of March, 1895, a few democrats, most of them members of Congress, issued an address to the democrats of the nation, asserting that the money question was the paramount issue of the hour; declaring that a majority of the Democratic Party had the right to control the action of the party on this paramount issue; and concluding with the request that the believers in the free coinage of silver in the Democratic Party should organize, take charge of, and control the policy of the Democratic Party. Three months later, at Memphis, an organization was perfected, and the silver democrats went forth openly and courageously proclaiming their belief, and declaring that, if successful, they would crystallize into

a platform the declaration which they had made. Then began the conflict. With a zeal approaching the zeal which inspired the crusaders who followed Peter the Hermit, our silver democrats went forth from victory unto victory until they are now assembled, not to discuss, not to debate, but to enter up the judgment already rendered by the plain people of this country. In this contest brother has been arrayed against brother, father against son. The warmest ties of love, acquaintance and association have been disregarded; old leaders have been cast aside when they have refused to give expression to the sentiments of those whom they would lead, and new leaders have sprung up to give direction to this cause of truth. Thus has the contest been waged, and we have assembled here under as binding and solemn instructions as were ever imposed upon representatives of the people.

We do not come as individuals. As individuals we might have been glad to compliment the gentleman from New York (Senator Hill), but we know that the people for whom we speak would never be willing to put him in a position where he could thwart the will of the Democratic Party. I say it was not a question of persons; it was a question of principle, and it is not with gladness, my friends, that we find ourselves brought into conflict with those who are now arrayed on the other side.

The gentleman who preceded me (ex-Governor Russell) spoke of the state of Massachusetts; let me assure him that not one present in all this convention entertains the least hostility to the people of the state of Massachusetts, but we stand here representing people who are the equals before the law of the greatest citizens in the state of Massachusetts. When you (turning to the gold delegates) come before us and tell us that we are about to disturb your business interests, we reply that you have disturbed our business interests by your course.

### **The Real Business Men**

We say to you that you have made the definition of a business man too limited in its application. The man who is employed for wages is as much a business man as his employer; the attorney in a country town is as much a business man as the corporation counsel in a great metropolis; the merchant at the cross-roads store is as much a business man as the merchant of New York; the farmer who goes forth in the morning and toils all day—who begins in the spring and toils all summer—and who by the application of brain and muscle to the natural resources of the country creates wealth, is as much a business man as the man who goes upon the board of trade and bets upon the price of grain; the miners who go down a thousand feet into the earth, or climb two thousand feet upon the cliffs, and bring forth from their hiding places the precious metals to be poured into the channels of trade are as much business

men as the few financial magnates who, in a back room, corner the money of the world. We come to speak for this broader class of business men.

Ah, my friends, we say not one word against those who live upon the Atlantic coast, but the hardy pioneers who have braved all the dangers of the wilderness, who have made the desert to blossom as the rose—the pioneers away out there (pointing to the West), who rear their children near to Nature's heart, where they can mingle their voices with the voices of the birds—out there where they have erected school houses for the education of their young, churches where they praise their Creator, and cemeteries where rest the ashes of their dead—these people, we say, are as deserving of the consideration of our party as any people in this country. It is for these that we speak. We do not come as aggressors. Our war is not a war of conquest; we are fighting in the defense of our homes, our families, and posterity. We have petitioned, and our petitions have been scorned; we have entreated, and our entreaties have been disregarded; we have begged, and they have mocked when our calamity came. We beg no longer; we entreat no more; we petition no more. We defy them.

The gentleman from Wisconsin has said that he fears a Robespierre. My friends, in this land of the free you need not fear that a tyrant will spring up from among the people. What we need is an Andrew Jackson to stand, as Jackson stood, against the encroachments of organized wealth.

### **Must Meet New Conditions**

They tell us that this platform was made to catch votes. We reply to them that changing conditions make new issues; that the principles upon which democracy rests are as everlasting as the hills, but that they must be applied to new conditions as they arise. Conditions have arisen, and we are here to meet those conditions. They tell us that the income tax ought not to be brought in here; that it is a new idea. They criticise us for our criticism of the Supreme Court of the United States. My friends, we have not criticised; we have simply called attention to what you already know. If you want criticisms, read the dissenting opinions of the court. There you will find criticisms. They say that we passed an unconstitutional law; we deny it. The income tax law was not unconstitutional when it was passed; it was not unconstitutional when it went before the Supreme Court for the first time; it did not become unconstitutional until one of the judges changed his mind, and we cannot be expected to know when a judge will change his mind. The income tax is just. It simply intends to put the burdens of government justly upon the backs of the people. I am in favor of an income tax. When I find a man who is not willing to bear his share of the burdens of the government which protects him, I find a man who is unworthy to enjoy the blessings of a government like ours.

### Against a National Bank Currency

They say that we are opposing national bank currency; it is true. If you will read what Thomas Benton said, you will find he said that, in searching history, he could find but one parallel to Andrew Jackson; that was Cicero, who destroyed the conspiracy of Cataline and saved Rome. Benton said that Cicero only did for Rome what Jackson did for us when he destroyed the bank conspiracy and saved America. We say in our platform that we believe that the right to coin and issue money is a function of government. We believe it. We believe that it is a part of sovereignty, and can no more with safety be delegated to private individuals than we could afford to delegate to private individuals the power to make penal statutes or levy taxes. Mr. Jefferson, who was once regarded as good democratic authority, seems to have differed in opinion from the gentleman who has addressed us on the part of the minority. Those who are opposed to this proposition tell us that the issue of paper money is a function of the bank, and that the government ought to go out of the banking business. I stand with Jefferson rather than with them, and tell them, as he did, that the issue of money is a function of government, and that the banks ought to go out of the governing business.

They complain about the plank which declares against life tenure in office. They have tried to strain it to mean that which it does not mean. What we oppose by that plank is the life tenure which is being built up in Washington, and which excludes from participation in official benefits the humbler members of society.

### The Minority Amendments

Let me call your attention to two or three important things. The gentleman from New York says that he will propose an amendment to the platform providing that the proposed change in our monetary system shall not affect contracts already made. Let me remind you that there is no intention of affecting those contracts which according to present laws are made payable in gold, but if he means to say that we cannot change our monetary system without protecting those who have loaned money before the change was made, I desire to ask him where, in law or morals, he can find justification for not protecting the debtors when the act of 1873 was passed, if he now insists that we must protect the creditors.

He says he will also propose an amendment which will provide for the suspension of free coinage if we fail to maintain the parity within a year. We reply that when we advocate a policy which we believe will be successful, we are not compelled to raise a doubt as to our own sincerity by suggesting what we shall do if we fail. I ask him, if he would apply his logic to us, why he does not apply it to himself. He says he wants this country to try to secure an international agreement. Why does he not tell us what he

is going to do if he fails to secure an international agreement? There is more reason for him to do that than there is for us to provide against the failure to maintain the parity. Our opponents have tried for twenty years to secure an international agreement, and those are waiting for it most patiently who do not want it at all.

### The Paramount Issue

And now, my friends, let me come to the paramount issue. If they ask us why it is that we say more on the money question than we say upon the tariff question, I reply that, if protection has slain its thousands, the gold standard has slain its tens of thousands. If they ask us why we do not embody in our platform all the things that we believe in, we reply that when we have restored the money of the constitution all other necessary reforms will be possible; but that until this is done there is no other reform that can be accomplished.

Why is it that within three months such a change has come over the country? Three months ago, when it was confidently asserted that those who believe in the gold standard would frame our platform and nominate our candidates, even the advocates of the gold standard did not think that we could elect a president. And they had good reason for their doubt, because there is scarcely a state here to-day asking for the gold standard which is not in the absolute control of the Republican Party. But note the change. Mr. McKinley was nominated at St. Louis upon a platform which declared for the maintenance of the gold standard until it can be changed into bimetallism by international agreement. Mr. McKinley was the most popular man among the republicans, and three months ago everybody in the Republican Party prophesied his election. How is it to-day? Why, the man who was once pleased to think that he looked like Napoleon—that man shudders to-day when he remembers that he was nominated on the anniversary of the battle of Waterloo. Not only that, but, as he listens, he can hear with ever-increasing distinctness the sound of the waves as they beat upon the lonely shores of St. Helena.

Why this change? Ah, my friends, is not the reason for the change evident to any one who will look at the matter? No private character, however pure, no personal popularity, however great, can protect from the avenging wrath of an indignant people a man who will declare that he is in favor of fastening the gold standard upon this country or who is willing to surrender the right of self government and place the legislative control of our affairs in the hands of foreign potentates and powers.

### Confident of Success

We go forth confident that we shall win. Why? Because upon the paramount issue of this campaign there is not a

spot of ground upon which the enemy will dare to challenge battle. If they tell us that the gold standard is a good thing, we shall point to their platform and tell them that their platform pledges the party to get rid of the gold standard and substitute bimetallism. If the gold standard is a good thing, why try to get rid of it? I call your attention to the fact that some of the very people who are in this convention to-day and who tell us that we ought to declare in favor of international bimetallism—thereby declaring that the gold standard is wrong and that the principle of bimetallism is better—these very people four months ago were open and avowed advocates of the gold standard, and were then telling us that we could not legislate two metals together, even with the aid of all the world. If the gold standard is a good thing, we ought to declare in favor of its retention and not in favor of abandoning it; and if the gold standard is a bad thing why should we wait until other nations are willing to help us to let go? Here is the line of battle, and we care not upon which issue they force the fight; we are prepared to meet them on either issue or on both. If they tell us that the gold standard is the standard of civilization, we reply to them that this, the most enlightened of all the nations of the earth, has never declared for a gold standard and that both the great parties this year are declaring against it. If the gold standard is the standard of civilization why, my friends, should we not have it? If they come to meet us on that issue we can present the history of our nation. More than that; we can tell them that they will search the pages of history in vain to find a single instance where the common people of any land have ever declared themselves in favor of the gold standard. They can find where the holders of fixed investments have declared for a gold standard, but not where the masses have.

### Carlisle Defines the Issue

Mr. Carlisle said in 1878 that this was a struggle between “the idle holders of idle capital” and “the struggling masses, who produce the wealth and pay the taxes of the country,” and, my friends, the question we are to decide is: Upon which side will the Democratic party fight: upon the side of the “idle holders of idle capital” or upon the side of “the struggling masses”? That is the question which the party must answer first, and then it must be answered by each individual hereafter. The sympathies of the Democratic party, as shown by the platform, are on the side of the struggling masses who have ever been the foundation of the Democratic party. There are two ideas of government. There are those who believe that, if you will only legislate to make the well-to-do prosperous, their prosperity will leak through on those below. The Democratic idea, however, has been that if you legislate to make the masses prosperous, their prosperity will find its way up through every class which rests upon them.

You come to us and tell us that the great cities are in favor of the gold standard; we reply that the great cities rest upon our broad and fertile prairies. Burn down your cities and leave our farms, and your cities will spring up again as if by magic; but destroy our farms and the grass will grow in the streets of every city in the country.

### A New Declaration of Independence

My friends, we declare that this nation is able to legislate for its own people on every question, without waiting for the aid or consent of any other nation on earth; and upon that issue we expect to carry every state in the Union. I shall not slander the inhabitants of the fair state of Massachusetts nor the inhabitants of the state of New York by saying that, when they are confronted with the proposition, they will declare that this nation is not able to attend to its own business. It is the issue of 1776 over again. Our ancestors when but three millions in number, had the courage to declare their political independence of every other nation; shall we, their descendants, when we have grown to seventy millions, declare that we are less independent than our forefathers? No, my friends, that will never be the verdict of our people. Therefore, we care not upon what lines the battle is fought. If they say bimetallism is good, but that we cannot have it until other nations help us, we reply that, instead of having a gold standard because England has, we will restore bimetallism, and then let England have bimetallism because the United States has it. If they dare to come out in the open field and defend the gold standard as a good thing, we will fight them to the uttermost. Having behind us the producing masses of this nation and the world, supported by the commercial interests, the laboring interests, and the toilers everywhere, we will answer their demand for a gold standard by saying to them: You shall not press down upon the brow of labor this crown of thorns; you shall not crucify mankind upon a cross of gold.

### Platform of the American Anti-Imperialist League (1899)

In John A. Scott, ed., *Living Documents in American History*, Vol. 1 (New York: Washington Square Press, 1964–68), pp. 613–614

We hold that the policy known as imperialism is hostile to liberty and tends toward militarism, an evil from which it has been our glory to be free. We regret that it has become necessary in the land of Washington and Lincoln to reaffirm that all men, of whatever race or color, are entitled to life, liberty, and the pursuit of happiness. We maintain that governments derive their just powers from the consent of the governed. We insist that the subjugation of any people

is “criminal aggression” and open disloyalty to the distinctive principles of our government.

We earnestly condemn the policy of the present national administration in the Philippines. It seeks to extinguish the spirit of 1776 in those islands. We deplore the sacrifice of our soldiers and sailors, whose bravery deserves admiration even in an unjust war. We denounce the slaughter of the Filipinos as a needless horror. We protest against the extension of American sovereignty by Spanish methods.

We demand the immediate cessation of the war against liberty, begun by Spain and continued by us. We urge that Congress be promptly convened to announce to the Filipinos our purpose to concede to them the independence for which they have so long fought and which of right is theirs.

The United States have always protested against the doctrine of international law which permits the subjugation of the weak by the strong. A self-governing state cannot accept sovereignty over an unwilling people. The United States cannot act upon the ancient heresy that might makes right.

Imperialists assume that with the destruction of self-government in the Philippines by American hands, all opposition here will cease. This is a grievous error. Much as we abhor the war of “criminal aggression” in the Philippines, greatly as we regret that the blood of the Filipinos is on American hands, we more deeply resent the betrayal of American institutions at home. The real firing line is not in the suburbs of Manila. The foe is of our own household. The attempt of 1861 was to divide the country. That of 1899 is to destroy its fundamental principles and noblest ideals.

Whether the ruthless slaughter of the Filipinos shall end next month or next year is but an incident in a contest that must go on until the Declaration of Independence and the Constitution of the United States are rescued from the hands of their betrayers. Those who dispute about standards of value while the foundation of

the republic is undermined will be listened to as little as those who would wrangle about the small economies of the household while the house is on fire. The training of a great people for a century, the aspiration for liberty of a vast immigration are forces that will hurl aside those who in the delirium of conquest seek to destroy the character of our institutions.

We deny that the obligation of all citizens to support their government in times of grave national peril applies to the present situation. If an administration may with impunity ignore the issues upon which it was chosen, deliberately create a condition of war anywhere on the face of the globe, debauch the civil service for spoils to promote the adventure, organize a truth-suppressing censorship, and demand of all citizens a suspension of judgment and their unanimous support while it chooses to continue the fighting, representative government itself is imperiled.

We propose to contribute to the defeat of any person or party that stands for the forcible subjugation of any people. We shall oppose for reelection all who in the White House or in Congress betray American liberty in pursuit of un-American ends. We still hope that both of our great political parties will support and defend the Declaration of Independence in the closing campaign of the century.

We hold with Abraham Lincoln, that “no man is good enough to govern another man without that other’s consent. When the white man governs himself, that is self-government, but when he governs himself and also governs another man, that is more than self-government—that is despotism.” “Our reliance is in the love of liberty which God has planted in us. Our defense is in the spirit which prizes liberty as the heritage of all men in all lands. Those who deny freedom to others deserve it not for themselves, and under a just God, cannot long retain it.”

We cordially invite the cooperation of all men and women who remain loyal to the Declaration of Independence and the Constitution of the United States.

# About the Editors

---

★

**General Editor: Gary B. Nash** received a Ph.D. from Princeton University. He is director of the National Center for History in the Schools at the University of California, Los Angeles, where he teaches American history of the colonial and Revolutionary era. He is a published author of college and precollegiate history texts. Among his best-selling works are the coauthored *American People: Creating a Nation and Society* (Longman, 1998), now in its seventh edition; *American Odyssey: The U.S. in the Twentieth Century* (McGraw-Hill/Glencoe, 1999), now in its fourth edition; and *The Atlas of American History*, coauthored with Carter Smith (Facts On File, 2006).

Nash is an elected member of the Society of American Historians, the American Academy of Arts and Sciences, the American Antiquarian Society, and the American Philosophical Society. He has served as past president of the Organization of American Historians in 1994–95

and was a founding member of the National Council for History Education. His latest books include *First City: Philadelphia and the Forging of Historical Memory* (University of Pennsylvania Press, 2002), *The Unknown American Revolution: The Unruly Birth of Democracy and the Struggle to Create America* (Viking, 2005), and *The Forgotten Fifth: African Americans in the Era of Revolution* (Harvard University Press, 2006).

**Volume Editor: Elizabeth Faue**, Wayne State University, received a Ph.D. from the University of Minnesota. She is the author of *Community of Suffering and Struggle: Women, Men, and the Labor Movement in Minneapolis, 1915–1945* (University of North Carolina Press, 1991) and *Writing the Wrongs: Eva Valesh and the Rise of Labor Journalism* (Cornell University Press, 2002).

# Foreword

The Encyclopedia of American History series is designed as a handy reference to the most important individuals, events, and topics in U.S. history. In 10 volumes, the encyclopedia covers the period from the 15th century, when European explorers first made their way across the Atlantic Ocean to the Americas, to the present day. The encyclopedia is written for precollegiate as well as college students, for parents of young learners in the schools, and for the general public. The volume editors are distinguished historians of American history. In writing individual entries, each editor has drawn upon the expertise of scores of specialists. This ensures the scholarly quality of the entire series. Articles contributed by the various volume editors are uncredited.

This 11-volume encyclopedia of “American history” is broadly conceived to include the historical experience of the various peoples of North America. Thus, in the first volume, many essays treat the history of a great range of indigenous people before contact with Europeans. In the same vein, readers will find essays in the first several volumes that sketch Spanish, Dutch, and French explorers and colonizers who opened up territories for European settlement that later would become part of the United States. The venues and cast of characters in the American historical drama are thus widened beyond traditional encyclopedias.

In creating the eras of American history that define the chronological limits of each volume, and in addressing major topics in each era, the encyclopedia follows the architecture of *The National Standards for United States History, Revised Edition* (Los Angeles: National Center for History in the Schools, 1996). Mandated by the U.S. Congress, the national standards for U.S. history have been widely used by states and school districts in organizing curricular frameworks and have been followed by many other curriculum-building efforts.

Entries are cross-referenced, when appropriate, with *See also* citations at the end of articles. At the end of most entries, a listing of articles and books allows readers to turn to specialized sources and historical accounts. In each volume, an array of maps provide geographical context, while numerous illustrations help vivify the material covered in the text. A time line is included to provide students with a chronological reference to major events occurring in the given era. The selection of historical documents in the back of each volume gives students experience with the raw documents that historians use when researching history. A comprehensive index to each volume also facilitates the reader’s access to particular information.

In each volume, long entries are provided for major categories of American historical experience. These categories may include: African Americans, agriculture, art and architecture, business, economy, education, family life, foreign policy, immigration, labor, Native Americans, politics, population, religion, urbanization, and women. By following these essays from volume to volume, the reader can access what might be called a mini-history of each broad topic, for example, family life, immigration, or religion.

—Gary B. Nash  
University of California, Los Angeles

# Foreword to the Revised Edition

“History has to be rewritten in every generation because, although the past does not change, the present does,” writes Lord Christopher Hill, one of Great Britain’s most eminent historians. “Each generation asks new questions of the past, and finds new areas of sympathy as it re-lives different aspects of the experiences of its predecessors.” It is this understanding, that the pursuit of historical knowledge requires new research and new reflections on the past, that undergirds a revised and extended edition of the *Encyclopedia of American History*.

The individual volume editors of this revised edition have made important additions and revisions to the original edition published in 2003. Most important, they have added many new entries—several hundred for the entire 11-volume set. This puts more meat on the bone of what was already a comprehensive encyclopedia that presented four centuries of American history in all its diversity and complexity. For the 10th volume, covering the period from 1969 to the present, new entries cover momentous events and important figures of the last six years. For the other volumes, new entries increase the diversity of Americans covered by biographical accounts as well as events that new scholarship shows have had greater importance than recognized heretofore.

In addition, careful attention has been given to correcting occasional errors in the massive number of entries in the first edition. Also, many entries have been revised to add further details while making adjustments, based on new scholarship, to the interpretation of key events and movements. Consonant with that effort to make the encyclopedia as fresh and usable as possible, the volume editors have added many new recently published books to the “Further Reading” notes at the ends of the entries, and new full-color historical maps help put history in its geographical context.

—Gary B. Nash

# Introduction

---

★

*The Emergence of Modern America*, the seventh volume of the Encyclopedia of American History, covers the period between 1900 and 1928. During these years, the United States experienced economic, political, and social change that was unprecedented in its history. While its population grew at a slower rate than it had in previous decades, it experienced the greatest period of immigration in its history, with more than 1 million immigrants entering the country every year. Internal movements of men and women from rural to urban areas and especially from the rural South to the urban North made the United States a more urban and more racially complex nation. Economically, the nation grew at an astonishing rate, with mass-production industries leading the way. Its role in the world economy changed as it shifted from being a debtor to a creditor nation. Better nutrition and medical care and the spread of technological innovations, from the electric light to the automobile and radio, promised an improved standard of living, one that was reflected in declining mortality rates and an increase in life expectancy over these nearly 30 years.

These changes were reflected in new cultural, social, and political organizations. The federal government that had a small but important role in everyday life began to directly affect economic sectors, local communities, and individual families. In part, it was the economic chaos of the last three decades of the 19th century that brought a new era of government regulation. High unemployment, sporadic but persistent labor protest, social unrest, and individual bad conduct made some long for a more just society and others to seek increased social control. The merger movement among businesses in the early 20th century and the increasingly visible power of corporations in government sparked the interest of journalists and political organizations alike. Women, who had long fought for equal suffrage, were on the verge of winning the vote, and they increasingly participated in the nation's political, economic, and cultural life. Progressivism, the most important political movement of the era, drew upon this discontent to forge a diverse and sometimes internally contradictory agenda for national reform. Presidents during these decades, the vibrant Theodore Roosevelt and scholarly Woodrow Wilson, echoed and helped to shape the reform impulse within government. The high culture of literature and art and the mass culture of pulp magazines and Tin Pan Alley expressed both the despair and the optimism of the day.

World War I presented a turning point for a nation on the brink of world leadership in foreign affairs, economic development, and culture. Unlike the chief combatant nations of France, Germany, and Great Britain, the United States remained outside the conflict for the first three years of the war. Its economy grew in response to the demand for war matériel, food, and clothing. Moreover, its war debt was small in comparison to the enormous indebtedness incurred by both the Allied and Central Powers in the war. Entering the war in 1917, the United States suffered fewer casualties than any other combatant nation and emerged from the war as the leader of the world economy. The war had other costs, however. Internal disputes over the wisdom of intervening in a European war, escalating labor conflict, and racial division sparked government regulation and surveillance. Ethnic and racial conflict added fuel to the fire as the superpatriotic societies and the Ku Klux Klan organized throughout the nation and race riots plagued cities during and after the war. The persistent demand to restrict immigration had its victory in new laws that instituted literacy tests and national quotas. Government agencies repressed labor unions, and socialist political organizations were repressed in the Red Scare of 1919–20; peace organizations found themselves similarly targeted. The federal government, which expanded in the course of the war, quickly dismantled wartime agencies by the 1920s, but the war's impact was not so easily forgotten. The recession of 1921–22 and the agricultural depression of the 1920s had their impact on the nation's attitudes as well.

In the 1920s, while the United States experienced some measure of economic prosperity, there remained questions about the need for greater social justice and more equal distribution of the nation's wealth. Conservative presidential administrations under Warren Harding, Calvin Coolidge, and Herbert Hoover reorganized the executive branch, lowered wartime taxes, and placed the federal government on a conservative fiscal footing, but none of them foresaw what the long-term trends of employment, a farm sector in recession, or the exuberant stock market speculation of the 1920s might do to the American economy. Increased tariffs, the debt crisis in Europe, and heightened international hostilities suggested that the next two decades would bring change as great and traumatic as that experienced by the modern nation that emerged between 1900 and 1928.

## A TO Z

**Abbott, Grace** (1878–1939) *social worker, child labor reformer*

One of the leading figures in the progressive reform movement, Grace Abbott was best known as the director of the United States CHILDREN'S BUREAU from 1921 to 1934. She had served in a number of other organizations that prepared her for the directorship. Born in Grand Island, Nebraska, Abbott graduated from a local college in 1898 and went to work as a high school teacher. She did graduate work at the University of Nebraska in 1902–03, and in 1906 attended summer school at the University of Chicago. It was at the University of Chicago where she was exposed to the new field of SOCIAL WORK and social reform movements. After returning to teach another year in Nebraska, Abbott moved to Chicago in 1907 in order to take advantage of the opportunities available to women in the fields of social reform. She moved into Hull-House in 1908 and completed her master's degree in political science at the University of Chicago in 1909.

Abbott became director of the Immigrants' Protective League in 1908. In this position she became an expert on IMMIGRATION. She published numerous articles and in 1917 published her first book, *The Immigrant and the Community*. Her work in the Immigrants' Protective League attracted the attention of Julia Lathrop, director of the United States Children's Bureau. In 1917, Abbott joined Lathrop in Washington as director of children's services for the Children's Bureau where she fought for the creation of the first federal CHILD LABOR law, the KEATING-OWEN ACT. After the U.S. Supreme Court ruled the law unconstitutional in *Hammer v. Dagenhart*, Abbott returned to Chicago and reestablished the Immigrants' Protective League. As Julia Lathrop's handpicked successor, Abbott returned to Washington, D.C., as the second director of the Children's Bureau.

As head of the Children's Bureau, Abbott oversaw the implementation of the maternity and infancy protection legislation, known generally as the SHEPPARD-TOWNER

ACT. Sheppard-Towner established a federal-state partnership to develop state programs to promote women's and infants' health. The new legislation arose out of the reaction to the large number of babies who died in infancy and to the medical problems that mothers suffered in childbirth. Abbott actively lobbied governors and state legislatures to develop state programs that shared in the federal program. In addition, she reached out to women's organizations in the states, hoping to convince them to lobby their state governments in favor of the programs. Abbott also lobbied on behalf of a child labor amendment to the Constitution. When the Supreme Court overturned a second child labor law in 1922, advocates like Abbott turned their attention to a constitutional amendment that would outlaw child labor. The proposed amendment made it through Congress, but it failed to gain the ratification from the required number of states.

In 1927 Abbott began to face health problems that would plague her until her death. She was forced to take a break from the Children's Bureau in 1927 and again in 1931 to recover from tuberculosis. She resigned as director of the Children's Bureau in 1934 and returned to teach at the University of Chicago. She died from cancer in 1939.

**Adamson Act** (1916)

A key piece of Progressive Era legislation, the Adamson Act in 1916 provided railroad workers with new protections. The turn of the 20th century had witnessed unparalleled expansion in U.S. industrial activity that in turn led to renewed growth of trade unionism. Already by 1904, more than two million workers were trade union members.

## 2 Addams, Jane

These new members rallied for expanded rights, and the years between 1905 and 1910 saw the rise of the NEW UNIONISM. Massive strikes, public protests, and political activism brought the labor question into the forefront of political debate. In the 1912 presidential election, the AMERICAN FEDERATION OF LABOR, under the leadership of Samuel Gompers, supported the DEMOCRATIC PARTY. Its demands for a new antitrust act that excluded labor unions, for an eight-hour day for federal employees, and for workmen's compensation laws made their way into the Democratic platform.

Once in office, President WOODROW WILSON was aware that organized labor was a significant part of his constituency. To that end, he tried appealing to them as the "backbone of the nation." At the same time, Wilson was suspicious of large organizations in the American economy, whether business or labor. In creating a Department of Labor (1913), passing the CLAYTON ANTITRUST ACT of 1914, and establishing the INDUSTRIAL RELATIONS COMMISSION to look into recent labor violence, Wilson sought compromises between labor's demands and the open hostility of corporations and small businesses toward recognizing organized labor. Prior to the entry of the United States into WORLD WAR I, labor had attained other victories as well in the areas of CHILD LABOR and workmen's compensation. Working conditions and wages, however, continued to be areas of contention.

Fearing a growing militancy on the railroads and facing the possibility of going to war, the Wilson administration worked to mediate labor disputes on the nation's rails. In 1916, "to protect the pockets of our men," the railway brotherhoods threatened to strike on Labor Day for an eight-hour day. Fearing for both his PREPAREDNESS program and his reelection, Wilson pushed for Congress to pass the Adamson Eight Hour Act, which mandated an eight-hour workday on the nation's railroads. The law limited only the working hours of railroad labor, but its influence spread to other industries as well. After World War I ended, there were setbacks. Despite the defeat suffered in the Railroad Shopmen's strike of 1922, however, the Adamson Act and experiments with federal mediation of railroad labor disputes during the war gave railroad workers a continued and powerful union voice in improving their pay and working conditions.

### **Addams, Jane** (1860–1935) *American social worker*

One of the leading figures in Progressive Era reform, Jane Addams won worldwide recognition for her work in establishing the Hull-House settlement house and as a peace advocate. Throughout her life, she dedicated herself to improving the lives of needy men, women, and children. Born in Cedarville, Illinois, Addams grew up in a politically active household, with a father who served as a state senator for 16 years. She was graduated from Rockford Female Seminary in 1881 and spent the next six years traveling, studying, and contemplating a career. Struggling against the restrictions placed on women at the time, Addams spent these six years searching for a meaningful career that was open to her as a woman. During her travels to London, England, Addams visited a settlement house and discovered her life's ambition. In 1889 she and Ellen Gates Starr leased a home in an underprivileged area of Chicago and established Hull-House with the purpose of providing "a center for higher civic and

Jane Addams (Library of Congress)

philanthropic enterprises and to investigate and improve the conditions in the industrial districts of Chicago."

At Hull-House, Addams developed a variety of programs aimed at improving the poor conditions in which working-class immigrants lived. She hoped that the immigrants could learn middle-class social and cultural ways as a means to improving their lives. The programs at Hull-House included kindergarten classes, cooking classes, club meetings, art and English classes. As attendance swelled, Addams expanded into neighboring buildings until Hull-House encompassed a city block. The additions included an art gallery, a public kitchen, a coffee house, a gymnasium, a swimming pool, a bookbindery, an art studio, a circulating library, an employment bureau, and a labor museum.

Under Addams, Hull-House became one of the focal points of American reform. Its influence spread beyond the neighborhood which it served. Many of the key figures in Progressive Era reform, including FLORENCE KELLEY and GRACE ABBOTT, started their careers at Hull-House under Addams's tutelage. In addition, she led investigations into juvenile delinquency, poverty wages, midwifery, narcotics use, milk supplies, sanitary conditions, and working conditions, particularly for women and children. These investigations spurred numerous improvements in the lives of working Americans.

Addams was an ardent opponent of war, a position for which she suffered public criticism during WORLD WAR I. She gave her first speeches against war in 1906, and by 1915 she was chairperson of two peace organizations. Addams publicly opposed America's entrance into the war in 1917, and she was attacked in the press for her position. Despite her opposition to the war, she served in the U.S. government's program to provide relief for European citizens affected by the war. Addams suffered a heart attack in 1926 after which she never fully regained her health. In 1931 she was awarded the Nobel Peace Prize for her lifetime of work helping the unfortunate. She died in 1935 from heart-related ailments and cancer.

### **Adkins v. Children's Hospital** (1923)

In the Progressive Era, the Supreme Court decision in *Adkins v. Children's Hospital* became part of the crusade to remedy women's poor wages and working conditions.

Contemporary studies of working women revealed that the average woman worker was single, between the ages of 16 and 24, and of foreign birth or parentage. Driven by the necessity to earn wages either to support themselves or to contribute to family income, women were forced to accept jobs, many of which paid less than a living wage. Working in mass-production industries or in the new clerical and service industries, women had little bargaining power, often met resistance in organizing unions, and had few political options as women did not yet have the right to vote. The solution, many argued, was a governmentally mandated minimum wage, which would allow working women to earn a respectable income and avert destitution. In the wake of *MULLER V. OREGON*, a Supreme Court decision that confirmed the constitutionality of maximum hour laws to protect women workers on the basis of their future role as mothers, reformers pushed through a wave of state minimum wage laws, many of which were controversial in their regulation of wages, and not working conditions.

The Washington, D.C., minimum wage law for women was contested in *Adkins v. Children's Hospital* on the grounds that it was an infringement of women's right of free contract under the Constitution. The Supreme Court in the case declared that sex-specific minimum wage laws were beyond the powers of government. In part, their justification lay in the recent victory of woman suffrage, which arguably eliminated women's political disabilities. If women had the same political rights as men, including the right to vote, they should no longer be a protected class under the law. The Court also seemed to distinguish law regulating the hours and conditions of labor, which the government had the right to establish to protect the public's interest in motherhood, and minimum wage laws, which were about what a worker received in compensation for labor. The latter, they believed, was a function of the market and not the state.

In subsequent laws and test cases, minimum wage laws for women remained under attack, both on the grounds of limitations on governmental power but also because minimum wage commissions, the device by which most states determined women's wages on an industry basis, were thought to be an inadequate guarantee of an employer's right to due process. Only with the passage of the federal Fair Labor Standards Act in 1938, which created a federal minimum wage for both men and women workers, did the push for women's minimum wage laws start to abate as the Court confirmed the constitutionality of general minimum wage regulation.

## 4 advertising

by *Our Constitution: Women Workers and the Minimum Wage* (Princeton N.J.: Princeton University Press, 1994).

### advertising

Advertising as an occupation and an industry gained momentum in the early decades of the 20th century. Advertising began in the field of public relations, as private charities and public agencies found ways to solicit public support and publicize their good works. Acting for these agencies, and later for businesses, advertising agents negotiated for space to advertise the service, product, or organization in newspapers and magazines. By 1900, however, the top two agencies in the United States—N.W. Ayer and Son and J. Walter Thompson—were not only writing advertising copy for their clients but also designing the ads. Local advertising agencies and branches of the larger firms soon cropped up in many cities. Advertising revenues became a major source of profits, both for the new agencies and for the newspapers and magazines that published their copy. Advertising became big business as manufacturers sought new markets for an ever-broadening range of consumer items, from personal toiletries to the automobile. Com-

panies now spent over \$100 million a year on advertising, double what they had in 1880. The next 30 years saw the emergence of modern advertising with its new approaches to marketing goods and surveying the public, new methods of persuasion, and an advertising creed to match.

The advertising industry began to develop professional standards and organizations. There was the beginning of the movement toward a regular 15 percent commission for advertising as well as the growth of agency services. To promote the industry, the Association of Advertising Clubs of America was formed in 1904. Complaints about unfair and dishonest ads led to new government regulations under the FEDERAL TRADE COMMISSION ACT of 1914. Just a few years later, in 1917, 111 advertising agencies established the American Association of Advertising Agencies to further the industry's growth.

An important figure in developing modern advertising was Albert Lasker. Known as “the Father of Advertising” by his admirers and “the Apostle of the Obvious” by his critics, he started as a floor sweeper with Lord and Thomas, one of the leading advertising firms in Chicago, in 1884. By 1898, he owned the company. Lasker persuaded one client, a hearing aid manufacturer, to increase its advertising budget from \$10,000 to \$180,000 a year on the basis of his slogans. Master of the “tricky slogan,” he attracted big clients to his firm, including Lucky Strike, Pepsodent, Kleenex, RCA, and Frigidaire. By 1921, it was the top-ranked advertising firm in the country. In that year, he left to head the UNITED STATES SHIPPING BOARD and returned to save his failing agency in 1923. His idea of business, he professed, “was to render service and to make money.” His ideal of “salesmanship in print” drove up industry competition.

Lasker was only one of a handful of agency heads to push the industry forward in its approach and method. F. Wayland Ayer of N.W. Ayer and Son built his agency by adding branch offices in major cities and creating a new business department. His decision to hire full-time copywriters and artists set the industry standard before 1910, and he pioneered in media research. Having coined the phrase, “It pays to advertise,” J. Walter Thompson headed Ayer's major competitor. Thompson was famous for inventing the testimonial ad. In 1921, his agency developed a marketing research department when it hired Harvard psychologist John Watson. In a more direct fashion, advertiser Helen Lansdowne Resor gave advertising a twist of sex appeal with her 1911 ad for Woodbury Facial Soap, “The Skin You Love to Touch.” Celebrity advertising also filled up the pages of magazines as advertisers educated the public through “the medium of personalities.” These new approaches gave advertising a stronger hold on the imagination of both the public and industry.

By the 1920s, the birth and rapid expansion of public radio programs and a growing number of mass market

magazines opened the way for increasing use of advertising. The industry grew rapidly due to the explosion of advertising revenues during WORLD WAR I, when the government sponsored its own “advertising” with the COMMITTEE FOR PUBLIC INFORMATION under George Creel. Advertising whiz Bruce Barton was himself the product of United War Work campaigns that he worked on with later partners Roy Durstine and Alex Osborn. In addition to expanding the domain of advertising, the industry benefited as well from new consumer credit plans. The 1920s saw consumers spend an increasing proportion of their wages on consumer durables such as cars, radios, and household appliances. Ads for consumer products became a staple of the new mass-market magazines and radio broadcasts. By 1923, the first radio series to be sponsored by company advertising, National Carbon Company’s *Eveready Hour*, was broadcast. Within a few years, company-sponsored programs such as *The Jack Benny Show* and *General Foods Cooking School* competed for radio time. In an era of expanding markets, advertising budgets climbed from \$1.4 billion in 1919 to nearly \$3 billion in 1929.

In new consumer-oriented ads, advertisers shifted from focusing on the producer of goods to selling the consumer, from the product to the benefits of its use. New ads focused on the personal and intimate aspects of consumer goods. The consumer, advertisers suggested, was expressing a sense of self in purchasing. There were sexualized images and puns. In an advertisement for an automobile parts maker, “body by Fisher” had a double meaning when the ad model was a stunning woman in an evening dress. At the same time, three of the most successful campaigns of the age—Fleischman’s yeast, Listerine, and Kotex—played on consumer’s fears of illness and hopes for a successful personal life.

For these reasons, the advertising industry had a powerful pull on the culture of the time. President CALVIN COOLIDGE in 1926 told the American Association of Advertising Agents that they were engaged in “the great work of regeneration and redemption of mankind.” “It is,” he said, “the most potent influence in adapting and changing the habits and modes of life, affecting what we eat, what we wear, and the work and play of a whole nation.” The almost religious zeal of advertising was best illustrated by the life of one of the foremost businessmen of the 1920s, advertising prophet Bruce Barton. Alistair Cooke wrote of Barton that he “came as close as any one will to achieving a philosophy of advertising, because he saw the whole of human history as an exercise in persuasion.” Barton’s book, *The Man Nobody Knows* (1925), portrayed Jesus as a modern businessman who practiced what Barton called “the creative force” of advertising. He also was known for popularizing the Harvard Classics series and inventing the figure of Betty Crocker. His fame in advertising later led to a political career in Congress.

Advertising reached the end of the 1920s as one of the leading forces in American life. It pervaded thousands of newspapers and magazines and saturated the radio air waves. At the same time, advertising’s prosperity depended ultimately on the health of the consumer economy. When, in 1929, the economy began to falter, so too did advertising revenues. From 1929 to 1933, they declined from \$3.5 billion to \$1.5 billion. Advertising agencies, like other services, suffered from the weakness of the economy as a whole. While it would take more than a decade to restore the economy—and the faith in its self-advertised prosperity—advertising rebounded in the mid-1930s as the New Deal lent great importance to advertising economic recovery.

### Agricultural Marketing Act (1929)

Designed to address the deteriorating farm economy, the Agricultural Marketing Act of 1929 was the most important piece of farm legislation passed under the Hoover administration. Elected in 1928 as the third consecutive Republican president, Herbert Hoover set out to maintain the economic growth much of the nation had witnessed for the past decade. Despite this apparent prosperity, structural problems persisted in the American economy that ultimately contributed to its collapse. In particular, rural residents and farmers were left out of much of the economic prosperity of the twenties. WORLD WAR I had created an expanded market for American agricultural goods; but with the cessation of hostilities in Europe, the market contracted as agricultural production on the continent resumed. With shifting market conditions of the postwar period, agricultural prices in the United States steadily declined. While lower prices for many durable consumer goods such as automobiles resulted in increased demand, most people did not purchase more bread as its price dropped.

Rural residents and farmers accordingly faced economic crisis well before the onset of the Great Depression in late 1929. Some 500,000 individuals lost their farms to bankruptcy during the 1920s. In response, farmers made persistent demands on the federal government for action during the course of the twenties. Hoover, who had served as the wartime food administrator, was aware of the poor

## 6 Agricultural Workers Organization

economic conditions in rural America at the end of the decade. He had supported agricultural legislation such as the CAPPER-VOLSTEAD ACT as secretary of commerce under WARREN G. HARDING. As president, Hoover pushed bills aimed at stabilizing the agricultural economy through a special session of Congress. For Hoover, glutted markets served as the primary factor undermining the health of agriculture in the United States, and he sought to address that problem.

One of the more favored responses advocated by farm organizations was federal support for cooperative arrangements. If farmers could buy, sell, and process through joint efforts, they could control their profits rather than surrender them to “middlemen” agricultural firms, long seen by farmers as one of the primary threats to their economic well-being. Farm cooperatives remained at a disadvantage in marketing their goods, and it was to this problem that the Hoover administration directed its attention.

The Agricultural Market Act created a revolving loan fund of \$500 million to help farm cooperatives market their major commodities and purchase surpluses of these goods off the market to force prices up. While not a solution for all farmers, the act helped to support agricultural cooperatives for the producers of perishable products and items that sold on a national, rather than a world, market. Some of the more successful cooperative arrangements were made in the fruit and dairy sector of agriculture. While many cooperatives began as family farms, they came to include such large cooperatives as Sunkist oranges, Land O’Lakes milk, Diamond walnuts, and Ocean Spray cranberries. The Agricultural Marketing Act stood to benefit a key part of the agricultural economy, but it is unclear how much it would have benefited farm producers after 1929. The act went into effect at the same time that the American economy as a whole collapsed in October 1929, and farm prices slumped and then fell catastrophically.

### agriculture

Although farmers had faced a shortage of capital, banking facilities, currency, and credit during the last two decades

of the 19th century, the new century brought a wave of prosperity to rural areas of the United States that would last until shortly after the end of WORLD WAR I. Despite experiencing substantial wartime prosperity, the agricultural economy by the 1920s displayed clear signs of the structural weaknesses that would prove ruinous for many farmers. Nevertheless, during the “Golden Age” of agriculture from 1900 to 1920, gross farm incomes doubled and real farm income (gross income adjusted for inflation) increased by some 40 percent. Beyond the yearly increases in income, the real growth in the prosperity of farmers came with steadily increasing land values, holding out the promise of future economic well-being.

The prosperity that farmers experienced during the first two decades of the 20th century largely emanated from increasing demand for their products. While the amount of land under agricultural production more than doubled in the last quarter of the 19th century, only about 12 percent more land was brought into production between 1900 and the early 1920s. Not only had the majority of productive farmland already been brought into production by 1900, but also farmers tended to not increase their landholdings during that time.

An important source of rural prosperity stemmed from foreign markets, where farmers increasingly sold a new, wider range of products between 1900 and the First World War. As farmers steadily pushed into the few remaining productive agriculture lands, in places like Florida and California, the range of agricultural commodities shifted. By 1914, citrus fruits, sugar, oil crops, poultry, and eggs had made steady gains as major agricultural commodities American farmers produced. Despite this shift in the type of products being grown, hay, grains, wool, and meat animals remained key components in the agricultural economy. Technological improvements aided the rapidly growing agricultural economy and led to the introduction of new commodities. Not only mechanization on individual farms, especially the introduction of the internal combustion engine, but also the introduction and expansion of new containers, such as refrigerated railway cars, made the transport of perishable goods easier and more efficient. The citrus fruit industry, for example, expanded as its products could be transported and sold on a national market as opposed to simply within local markets in California and Florida.

Although willing to introduce many modern conveniences to their daily living conditions, many farmers—having witnessed the economic difficulties of the late 19th century—were reluctant to invest in capital improvements. They hesitated to expand landholdings and purchase new equipment to increase farm productivity. As a result, with productivity increasing by only about 1 percent per year, agricultural output could not keep pace with the steady increase (approximately 40 percent) in the nation’s popula-

Poster featuring Uncle Sam as an advocate for gardening, 1917 (Library of Congress)

tion during the first quarter of the 20th century. Accordingly, the prices of agricultural commodities rose because of an increasing demand that could not be fully met by American farmers. In addition, the world market also became quite friendly to American farmers between 1900 and 1920, which added to their profits. In particular, American agricultural commodities were in high demand across Europe with the outbreak of war in 1914.

Despite the reluctance of farmers to invest in extensive capital improvements, the introduction of mechanical farm equipment had dramatic and long-term consequences on American society, especially in the South. There, even the limited introduction of mechanization resulted in a slowly decreasing demand for African-American laborers, who had made up the bulk of the rural labor force through tenant and sharecropping arrangements. Although cotton remained the least mechanized farm crop through the 1930s, the gradual introduction of mechanical devices helped to loosen some of the economic and political conditions that tied African Americans to the region. In addi-

tion to mechanical devices, the infestation of cotton by the boll weevil in the early part of the 20th century meant that for the first time since the end of the Civil War in 1865, a steady number of African Americans managed to migrate to northern cities, especially as the demand for industrial labor increased with the start of the war in Europe.

The war had created an expanded market for American agricultural goods and brought the means to borrow capital for expanding landholdings, but the cessation of hostilities in Europe caused the market to contract. Agricultural endeavors on the continent resumed, and European governments faced a capital shortage as they rebuilt their war-torn nations. With shifting market conditions during the 1920s, agricultural prices in the United States steadily declined. In 1919, wheat sold for \$2.19 per bushel, potatoes went for \$2.20 per hundredweight, and cotton received \$.35 per pound. By the end of the 1920s, however, a bushel of wheat sold for \$1.05, potatoes had declined to \$1.29, and cotton now received only \$.17. While lower prices for

many consumer goods resulted in increased demand, most people did not purchase more bread as its price dropped.

Not only did farmers have to contend with declining prices for many of their commodities, but also changing consumer tastes and new federal policies had a profound impact on agriculture. The passage of PROHIBITION in 1919 barred the sale and manufacture of alcoholic beverages and, accordingly, constricted the domestic market for barley and other grains. Similarly, shorter skirt styles and the introduction of such synthetic materials as rayon diminished the demand for cotton and wool. Another major factor that reshaped agriculture was the introduction of tractors to the production process, primarily in harvesting. While mechanization was a response to the shortage of labor, it ultimately meant fewer draft animals were needed by farmers, which further reduced the demand for various field crops traditionally used to feed work animals.

With declining prices and constricting markets, many rural residents and farmers faced an economic downturn well before the onset of the Great Depression in 1929. Some 500,000 individuals lost their farms to bankruptcy during the 1920s. In response, farmers made persistent demands for relief from the federal government during the course of the twenties. Farm advocates had long championed the need for low-interest loans to help promote and make affordable the capital improvements needed to expand individual farms. The FEDERAL FARM LOAN ACT in 1916 created the mechanism to extend low-interest loans for periods of five to 40 years to farmers through a Federal Farm Loan Board, 12 Federal Land Banks that paralleled the Federal Reserve Banks. As part of WOODROW WILSON's NEW FREEDOM initiative, the Farm Loan Act extended capital to farmers through a program that cut out private banks, which farmers viewed as outside institutions that exploited them.

Another mechanism introduced during the early part of the 20th century to address the needs and demands of agriculture was federal support for cooperative arrangements, which actually was one of the more favored responses long advocated by farmers. If farmers could buy, sell, and process through joint efforts, they would be able to better control the profits generated by their products. Cooperative arrangements did not stand to benefit all farmers. Instead, producers of perishable products and of items that sold on a national rather than a world market tended to benefit the most from cooperative arrangements. Some of the more successful cooperative arrangements were made in the fruit and dairy sector of agriculture and included such cooperatives as Sunkist oranges, Land O'Lakes milk, Diamond walnuts, and Ocean Spray cranberries. In 1922, the Farm Bloc in Congress passed the CAPPER-VOLSTEAD ACT, which protected cooperatives from antitrust legislation.

Another major piece of farm legislation was the AGRICULTURAL MARKETING ACT (1929). It created a revolving loan fund of \$500 million to help farm cooperatives market their major commodities and to purchase surpluses of goods off the market to force prices up. While this legislation stood to benefit a key part of the agricultural economy, it is unknown what its benefits might have been for producers after 1929. While industrial operations in the United States had benefited from protective tariffs, the prices of agricultural goods could not be pushed by these tariffs, especially as production outdistanced demand on the domestic market. In response to the demands of such groups as the American Farm Bureau, Congress in 1926 passed the McNARY-HAUGEN FARM BILL in an attempt to create parity for American agricultural goods. While Congress twice passed the bill, it was unable to override President CALVIN COOLIDGE's vetoes. Despite government efforts to address farmers' needs, the agricultural sector quickly fell into economic crisis with the collapse of the Stock Market in 1929.

### **Aguinaldo, Emilio** (1869–1964) *rebel*

Emilio Aguinaldo was the Filipino statesman and guerrilla leader who led the nationalist revolt against the American forces during the Filipino Insurrection (1898–1902). The son of the mayor of the town of Kawit, he assumed his father's position after achieving financial success running his family's sugar mill and dealing in cattle. While mayor, he became enamored of the Katipunan, a secret, mystical nationalist organization that combined the rituals of Roman Catholicism and Freemasonry. When the Filipinos rose up against Spanish colonial rule in August 1896, Aguinaldo joined the rebels and quickly distinguished himself as a guerrilla leader. Armed only with the most primitive of weapons, he and his followers managed to control three towns in his native province of Cavite.

Inspiring and resourceful as he was, Aguinaldo eventually was cornered by Spanish forces. With the Spanish unable to muster the resources necessary to storm his camp, and the nationalists unable to break out, the two sides came to a settlement. The Spanish promised reforms, and Aguinaldo agreed to accept 800,000 pesos, sign an oath forswearing rebellion, and leave the country.

In December 1897, Aguinaldo arrived in Hong Kong, immediately renounced his agreement with Spain, and began to plan a new rebellion. His efforts were given a boost a year later, when Admiral Dewey's fleet was assembling at Hong Kong in preparation for an attack on Manila Bay. Although Dewey asked Aguinaldo to help him defeat the Spanish, the admiral inexplicably sailed to Manila without him. Aguinaldo, who had made alternate travel arrangements, did not arrive until the naval battle was over.

Unable to get a firm answer from Dewey concerning Filipino independence, Aguinaldo declared the Philippines a provisional dictatorship with himself as its head. As his presence in the archipelago became known, Filipinos flocked to his cause. The nationalists soon surrounded Manila, effectively blocking the Spanish from leaving by land while Dewey blocked the routes to the sea.

When American ground forces arrived, they promised the Filipinos several artillery pieces if they would yield a sector of Manila. Aguinaldo agreed, and his troops left their trenches, but the cannons were never delivered. The Americans promptly stormed the city; and in a sham battle, designed to save the Spanish general from court-martial, they captured all of the Spanish troops. As a final insult, Aguinaldo was barred from the surrender ceremony.

Aguinaldo sent his troops to cover as much territory as possible so as to increase his leverage with the Americans. Tensions mounted between Filipino and American troops as they faced each other in the trenches around Manila. Once President William McKinley declared that the United States had sovereignty over the islands, Aguinaldo prepared for war.

Open hostilities began when an American private shot and killed several Filipino soldiers. Fearing that the Filipinos were within American lines, the commander ordered his troops to attack. In the open, pitched battles that followed, the Filipinos were decimated with casualties. Aguinaldo responded by quickly switching over to hit-and-run tactics. His guerrilla war and terrorist activities frustrated U.S. efforts to pacify the islands for the next three years.

The insurrection came to an end in 1902 when, in a daring raid by American troops, Aguinaldo was captured. He signed a document stating that he recognized American sovereignty, and he ceased hostilities. He lived quietly for the remainder of his life, except during World War II when he made pro-Japanese broadcasts. He died in 1964.

## American Civil Liberties Union (ACLU)

The American Civil Liberties Union had its origins in the PEACE MOVEMENT during WORLD WAR I, but its work harks back to earlier campaigns for CIVIL LIBERTIES in labor and political struggles. Established by the American Union against Militarism in 1917, the National Civil Liberties Bureau (NCLB) had as its original purpose legal protection of the rights of political dissenters, especially those active in opposing American participation in the war. At a time when dissent was equated with treason and support for the INDUSTRIAL WORKERS OF THE WORLD was viewed as criminal syndicalism, the Civil Liberties Bureau understood that the causes of labor, liberty, and peace were linked. When CONGRESS passed the SELECTIVE SERVICE ACT, the ESPIONAGE ACT, and the SEDITION ACT, anyone who openly opposed the military draft or engaged in criticism of the president, military uniforms, the American flag, or America's participation in the war was in violation of these wartime measures. When government sought to suppress the peace movement or to quash labor conflict, it was the NCLB that organized campaigns for the defense of radicals and pacifists.

ROGER BALDWIN, one of the NCLB founders and a conscientious objector, was convicted for opposing the military draft. He, along with thousands of others, was jailed for his opposition to the war. His release allowed Baldwin to join with Crystal Eastman, a radical lawyer and political activist, to found the American Civil Liberties Union in 1920. The new organization took as its purpose the defense of broadly defined individual civil liberties, such as free speech, free press, free assembly, and the right to equal protection under the law. Its mission states that the organization's purpose is "to defend and preserve the individual rights and liberties guaranteed to every person in this country by the Constitution and laws of the United States." The ACLU's roster of founders was long and distinguished, and its record unequaled among American legal organizations. In its ranks were future Supreme Court justice Felix Frankfurter; attorney CLARENCE DARROW; philosopher and educator JOHN DEWEY; historian Charles Beard; liberal minister John Haynes Holmes; Progressive reformers JANE ADDAMS, FLORENCE KELLEY, LILLIAN WALD, and UPTON SINCLAIR; editors Oswald Garrison Villard and Freda Kirchwey; socialist Norman Thomas; and radical labor organizer ELIZABETH GURLEY FLYNN. Encompassing this influential and powerful group, the ACLU from its beginnings took on a series of controversial court cases, sometimes on behalf of unsympathetic and even hostile defendants. ACLU lawyers contributed to the expansion of civil liberties in the 20th century and transformed constitutional law with their challenges to accepted judicial interpretations.

**Alien Exclusion Act** See IMMIGRATION ACT OF 1917.

## 10 American Expeditionary Force

The American Fund for Public Service, also known as the Garland Fund, supported the ACLU during the decade of the 1920s, as it turned to broader issues in civil liberties law. The ACLU fought the ban on the teaching of evolution in the schools in the *SCOPES TRIAL*, and it fought the imposition of the death penalty in the defense of *LEOPOLD AND LOEB*, whose murder case attracted national attention. One of the great public advocates of free speech, Clarence Darrow led the defense in both cases. He was joined by a new generation of labor and civil liberties lawyers, who took on the work of the ACLU in defending civil liberties throughout the 20th century.

### American Expeditionary Force (AEF)

When the United States entered *WORLD WAR I*, the U.S. Army numbered only around 128,000 men. The newly appointed commander of the American Expeditionary Force (AEF), General *JOHN PERSHING*, after touring the battlefields in France, quickly concluded that the United States would need at least 3 million men to be victorious in the war. Eventually over 4 million served. Chosen in April 1917 to lead the American army in Europe, Pershing was one of the few American generals with battle experience. He had commanded American forces in Mexico in their pursuit of Pancho Villa. Pershing was anxious to keep the American army together as a cohesive unit, rather than dispersing them as the European commanders desired. The need for troops on the European front strengthened Pershing's hand.

The entire initiative of the AEF was extremely important, as this was the first time that the United States sent a large land force outside its borders. Formed in large part by a civilian draft under the *SELECTIVE SERVICE ACT* of 1917, the AEF as a modern army was trained, equipped, and supplied thanks to the nation's industrial capacity. It was the first of its kind in United States history, an integrated national military, rather than a collection of state militia integrated into regular army divisions as in the past.

The military draft supplied the men, but the soldiers still had to be housed, clothed, armed, equipped, and trained. There were not enough officers, facilities, nor time to train the men. To address housing issues, a Cantonment Division was created, which set to work expanding existing military installations, and 16 tent camps were made for the National Guard in the South and 16 wooden barracks

Enlistment poster for the American Expeditionary Force  
(Library of Congress)

for the national army in the North. Clothing for the men also had to be provided. Almost 132 million pairs of socks were needed at the end of May 1918. Many soldiers had to wait for their full allotment of clothing and equipment. Production of ammunition, radio, and other military equipment fell short as companies sometimes signed contracts they had no hope of fulfilling. The government eventually stepped in, and the Army took control of the manufacturing process in many companies. The *WAR INDUSTRIES BOARD* set about dictating what it needed to industry and controlling resources.

During the war, a serious shortage of arms also needed to be addressed. Most weapons required leadtime to produce, and there were limits on production. Production on the Springfield service rifle, for example, could be increased to only 1,000 per day. As there were only 600,000 on hand, this was a major problem. It was many months after the United States declared war that it was able to effectively engage in fighting—only because France and Britain supplied weapons, ammunition, transportation, and equipment.

Despite these problems, the American soldiers were fresh compared with the war-weary French and British.

With their arrival in Europe, it was clear that a new era had arisen in the West. The American weight was now being heavily felt in the balance. American troops arrived in France in 1918. The first offensive occurred in September. On September 12, 1918, at 1:00 A.M., the Allied artillery opened fire. By September 13, Pershing's First Army controlled the Saint-Mihiel sector at a line from Haudimont to Vandières. Their victory cost 7,000 casualties. They took 15,000 German prisoners and 450 guns. By the 14th of September, the first units of Pershing's army redeployed to the Argonne sector; 500,000 men of the First Army assembled. On the 26th of September, the American First Army, with the French Fourth, resumed the offensive. Colonel George Patton's tank brigade accompanied them. By October 10, they controlled the forest. On October 12, 1918, Pershing decided that the First Army was too big. He created the Second Army and gave command to General Hunter Liggett.

Although the advancing Americans were eating up their supplies at a rapid rate, victory was close at hand. The Germans were near to conceding as their allies deserted them. The British blockade was causing critical food shortages, and the German armies were reeling. The Germans finally surrendered on November 11, 1918, what came to be called Armistice Day (Veterans Day, after World War II). The American Expeditionary Force saw only 150 days of combat, but in that time it seized 485,000 square miles of enemy held territory and captured 63,000 prisoners, 1,300 artillery pieces, and 10,000 mortars and machine guns.

### American Federation of Labor (AFL)

The American Federation of Labor was the most important labor organization of the Progressive Era. It brought workers together primarily from the skilled trades into a national organization that had as its purpose improving the conditions of labor through collective bargaining. In what was often called “pure and simple trade unionism,” the Federation gave priority to economic demands for wages and control over the labor process. The AFL claimed to be the political voice not only of organized labor but also of the working class in the United States. As such, it became increasingly involved in politics in the early 20th century, using its clout to push for state and federal legislation to prohibit child labor, restrict immigration, control the con-

ditions of federal employees, bar labor injunctions, and grant injured workers compensation.

Radical in its origins, the AFL by 1900 had taken on the conservative attitudes and old boy persona of its leaders, President Samuel Gompers, a cigar maker; Adolph Strasser, who belonged to the same trade; and Peter McGuire, the head of the carpenters' union. The AFL's primary constituents were workers in the skilled trades. Unlike the rival Knights of Labor, the AFL's avoided mobilizing workers across industry and occupation, targeting instead craft workers. Moreover, the AFL saw itself as an organization exclusively for workers, and it barred labor reformers, small business allies, and labor scholars from its ranks. There was a logic to the AFL's policy of exclusion. The Knights, many trade unionists believed, had misdirected their energies toward reform. Further, skilled workers such as cigar makers, printers, carpenters, machinists, iron molders, barrel makers, had, by virtue of their knowledge and training, greater control over their work and greater power in negotiating with employers. The length of apprenticeships and the limited pool of skilled labor made it difficult for employers to replace strikers with new workers or to substitute machines for those on strike. Skilled workers also were, due to strict rules and discrimination, primarily male, white, and native-born or naturalized citizens. These characteristics gave their trade unions greater bargaining power and political clout. The AFL's weapon of choice was a small, short, and focused strike against employers. It avoided the lengthy political programs and broad-based community protests that had characterized its predecessors.

At the turn of the century, the AFL was in the midst of an unprecedented expansion. In 1898, it had 278,000 members, and by 1903, its ranks had grown to 1,500,000. Under the influence of the NEW UNIONISM trade unions as well as the new semi-industrial unions like the UNITED MINE WORKERS OF AMERICA (UMWA), the Amalgamated Clothing Workers, and the INTERNATIONAL LADIES' GARMENT WORKERS UNION (ILGWU), organized those previously outside their domain. Benefiting from massive strikes, AFL unions enrolled growing numbers of skilled workers, especially in the metalworking trades. Indeed, the International Association of Machinists (IAM) was one of the fastest growing unions. Further, as new technologies of power (such as electric lighting) and methods of construction (such as steel-reinforced girders) were created, new groups of workers organized, among them the International Brotherhood of Electrical Workers (IBEW) and the Bridge and Structural Ironworkers. Growth in city streetcar systems also meant growing numbers of drivers and conductors, who organized their own unions. The building trades (carpenters, masons, bricklayers, etc.) were among the chief beneficiaries of urban growth. Their power within the AFL

## 12 Americanization

increased proportionately with their numbers. The new organizational strength of labor gave rise to a new wave of labor militancy and an increase in the rate of strike success.

As the labor federation grew, so too did its areas of interest. While it had experimented from time to time with political campaigns, the AFL chose, for the most part, to maintain a non-partisan strategy in politics by rewarding labor's friends and punishing its enemies. In general, the labor movement had been wary of government regulation of the workplace. It preferred to leave the issues of wages, hours, and working conditions to private bargaining and viewed the arena for state intervention as relatively limited. The only legislation it endorsed was concerned with limiting access to the labor market or with specific occupations, such as Chinese exclusion laws and the regulation of child labor.

In the face of growing employer hostility, the AFL began to seek federal relief from court injunctions. Key court decisions such as *DANBURY HATTERS* and *BUCK'S STOVE* sharply restricted labor's ability to bargain with employers by penalizing labor for the costs of strikes and even informal boycotts, such as "We Don't Patronize" lists. The AFL now sought legislation to limit the use of labor injunctions and to pass new measures to regulate child labor and institute an eight-hour day for government employees. Under the presidency of *WOODROW WILSON*, the AFL lobbied for and obtained the passage of the *CLAYTON ANTITRUST ACT*, which gave labor unions protection from antitrust laws. It witnessed the creation of a Department of Labor and supported new federal legislation for workers' compensation. With the *ADAMSON ACT*, railroad workers saw the eight-hour day become a reality. When the United States entered *WORLD WAR I*, the AFL cooperated with the war effort and took part in government efforts to mobilize labor and war industries. It also helped make the first steps toward government intervention in negotiating wages and working conditions during the wartime emergency through the *RAILROAD ADMINISTRATION*. In many sectors, workers signed no-strike pledges for the duration of the war. The payoff was the new and privileged role the AFL played in the federal government through the *NATIONAL WAR LABOR BOARD*.

After the war, the massive strikes of 1919, and the political reprisals of the *RED SCARE*, the labor movement went into shock. Experiments in industrial unionism ended in the losses of the *STEEL STRIKE OF 1919* and the postwar strikes in meatpacking and textiles. Labor's defeat in the coal and railroad shopmen's strikes of 1922 signaled a sharp decline in its political clout, as government intervention effectively repressed conflict. In stark contrast to the moderate Wilson administration, *WARREN G. HARDING's* presidency demonstrated hostility toward labor. Under Harding and his successor, *CALVIN COOLIDGE*, the chief labor victory was in the

area of immigration restriction. Labor's interest in limiting the influx of new workers complemented nativist concerns, and it joined them in endorsing the 1921 *QUOTA ACT* and the *NATIONAL ORIGINS ACT* of 1924. By the 1920s, national union leaders rarely touched on issues that concerned the mass of workers politically, such as work accidents, insurance, and relief. State labor federations experienced in politics did try to pass unemployment insurance in such states as Massachusetts, California, and Minnesota. The emphasis on state-level action was a response to the Supreme Court's tendency to declare unconstitutional the extension of federal power to protect the conditions and wages of labor. It also followed from the preference of organized labor for local activism and voluntary association.

With the 1924 death of Samuel Gompers, who had been federation president since 1886, the conservatism of the AFL was set in stone. His successor, William Green, was, if anything, more averse to state intervention in labor relations and demonstrated even greater hostility toward African-American, immigrant, and women workers. Faced with the growing discontent among workers in the late 1920s and the looming unemployment crisis, the AFL tread water. Ambivalent toward mass production industries, it resisted efforts to modernize or to embrace the coming wave of industrial unionism.

**Further reading:** Julie Greene, *Pure and Simple Politics: The American Federation of Labor, 1881–1917* (Cambridge, U.K.: Cambridge University Press, 1998); Philip Taft, *The AF of L in the Time of Gompers* (New York: Harper, 1957).

### Americanization

The mass *IMMIGRATION* waves of the early 20th century made the United States an even more ethnically and religiously diverse country. In particular, large cities grew from the influx of immigrants from southern and eastern Europe, and often more than 60 percent of a city's residents were foreign born or of foreign parentage, as was true in New York, Chicago, and Minneapolis–St. Paul. Unassimilated immigrants and their children, some argued, weakened American society and increased social disorder, as shown in increasing urban crime and widespread labor conflict. Further, the failure of many immigrants to become naturalized American citizens seemed to show that resident aliens retained allegiance to the countries of their birth. Disloyalty and subversion were the likely outcomes of those with no ties to the United States. These "hyphenated Americans," some warned, presented a threat to American democracy and social stability.

In response, Progressive reformers organized campaigns for the education of immigrants and their children.

Settlement House workers at places such as Hull-House in Chicago conducted CITIZENSHIP, American history, personal hygiene, and English classes; employers, such as HENRY FORD, tied benefits, such as the Five Dollar Day wage, to workers who took English lessons and had citizenship papers. Prior to 1914, Americanization efforts, which took on the tone of crusades, were begun in most major cities. The war in Europe only intensified such efforts. Under the leadership of sociologist Frances Kellor, more than 150 cities took part in a National Americanization Day on July 4, 1915. The campaigns continued as PREPAREDNESS, for a country threatened by world war, became the watchword of national life.

After the United States declared war in 1917, the Wilson administration moved to solidify public opinion behind the war effort and especially to shore up precarious national unity. Americanization campaigns were central to the effort. As the president declared, "There are citizens of the United States, I blush to admit, born under other flags but welcomed under our generous naturalization laws to the full freedom and opportunity of America, who have poured the poison of disloyalty into the very arteries of our national life. Such creatures of passion, disloyalty, and anarchy must be crushed out. The hand of our power should close over them at once." Most states established Americanization committees, which engaged in the domestic surveillance of foreign workers as well as in public education, patriotic parades, and civic events. At the core of Americanization campaigns was the deep belief that loyalty and patriotism required immigrants to assimilate to American society and that the key to assimilation was learning the language and history of their adopted country. In 1919, Kellor wrote, "The English language is a highway of loyalty; it is the open door to opportunity; it is a means of common defense." Woodrow Wilson put it more succinctly when he told immigrants at a ceremony, "You cannot dedicate yourself to America unless you become in every respect and with every purpose of your will thorough Americans."

At the grass roots, however, Americanization took on different meanings. Immigrants were, more often than not, committed to remaining in the United States and integrating into American society but on their own terms. If learning the English language, taking civics classes, serving in the military during World War I, and holding down a regular job were part of an elite agenda to Americanize immigrants and their children, such measures also provided real benefits for those who signed up. Further, the creation of ethnic mutual aid societies, ethnic businesses, and other voluntary associations demonstrated the civic engagement of immigrants and their children and showed how they had learned the American way of life.

## American Legion

The American Legion is the largest organization of VETERANS in the United States. Founded in Paris in 1919 by veterans of WORLD WAR I, it held its first convention in St. Louis that same year. The American Legion dedicated itself to fighting for the social and political interests of veterans and promoting Americanism and American interests.

One of several veterans' organizations formed in the aftermath of World War I, the legion's founders hoped to build on the sense of community that troops had shared in the war. The creation of the legion was aided by the makeup of the AMERICAN EXPEDITIONARY FORCE (AEF). Many Americans of impoverished backgrounds failed the physicals required to join the military. Others unrepresented were immigrants who had not become citizens and therefore were not required to register for the draft. The American forces were, therefore, predominately of middle- and lower-middle-class men of northern European ancestry. This dynamic gave the veterans a sense of shared community that they hoped to continue after the war. They also wanted to continue the patriotic crusade for democracy they had begun in Europe. The founders of the legion established it for two purposes. The first purpose was to take care of wounded veterans. The second purpose was to promote patriotism at home.

In the 1920s, when LOBBYING AND INTEREST GROUPS were on the rise, the American Legion became the most powerful lobby for veterans' issues, national defense, and anti-radical legislation. Responding to pressure from members, it lobbied the federal government for a payment to World War I veterans. They argued that the veterans had sacrificed earnings by joining the war effort and that the government should pay them for their lost earnings. In 1924 the legion and other veterans' advocates succeeded when Congress passed a bonus bill that granted them future payments. The American Legion also focused on fighting radicalism. Many legionnaires saw communism as a threat to Americanism and fought against radicalism in a variety of ways. In their first years, some legion groups physically attacked people whom they saw as dangerous to America. Although the legion was not clear as to what constituted Americanism, it knew what radicalism was and organized to fight it. Communists, socialists, labor leaders, and the

## 14 American Plan

AMERICAN CIVIL LIBERTIES UNION, for example, all fell into the group of radicals as defined by legion leaders. By the mid-twenties, the legion realized that violence in pursuit of Americanism was counterproductive and turned to legislative lobbying to further its aims. The legion was the most active group fighting radicalism in America. Members kept watch and publicized their beliefs about what was endangering American society. They also enjoyed access to elected officials who introduced legislation that allowed the legion to shape legislative debates. The legion network of state organizations was used to publicize an issue that it deemed important. In this role, the American Legion became an influential force in American politics.

### American Plan

After WORLD WAR I, conservative businessmen renewed their opposition to the rights of workers to organize collectively. Faced with massive strikes during and after the war, they turned to new methods to put an end to the work stoppages. At a 1919 meeting on industrial relations, John D. Rockefeller, Jr., newly inspired by Canadian MacKenzie King, suggested a more conciliatory approach to deal with labor. Those attending resisted compromise with the labor movement. Instead, over the next year, organized employers created a plan to roll back the wartime gains of the labor movement. Dubbed the American Plan, prominent industrialists and small business owners encouraged others to refuse to negotiate with labor unions. They launched a public relations campaign to persuade public opinion that closed union shops and labor unions themselves were “un-American.”

Recently founded employer organizations in more than 240 cities in some 44 states sponsored the new campaign to promote and maintain the open shop. (See OPEN SHOP MOVEMENT.) Other aspects of the American Plan called for a comprehensive program of political lobbying, economic campaigns, and efforts to break unions by seeking labor injunctions, blacklisting union employees, and organizing private guard associations. Arguing that American democracy required workers to have freedom of contract, groups such as the National Association of Manufacturers, local chambers of commerce, and employer groups in cities such as Minneapolis, Detroit, Seattle, San Francisco, and Toledo, refused to sign union contracts. They also worked through city and state governments to break local union power. They sponsored political tickets at the local level, bought newspaper ads and even newspapers, denied credit to or boycotted

small firms that held union contracts, and lobbied local, state, and federal governments to outlaw certain union practices.

The problem with the American Plan was that both large and small firms faced high labor turnover. Employers needed to maintain a stable labor force and to retain their skilled workers in particular. Under the rubric of WELFARE CAPITALISM, corporate heads put together programs of worker incentives, primarily directed at long-term skilled male employees. The companies provided pensions, stock options, public health nurses, and industrial social work departments. They sponsored company sports teams, picnics, and newsletters as well. Some employee representation programs served as company unions, giving workers a minimal voice in the workplace while forestalling individual grievances and labor trouble. They wanted to bar entirely outside union organizing. Using a “carrot-and-stick” approach, businesses sought to foster company loyalty among workers through a new system of rewards while discouraging them from joining unions through surveillance, blacklisting, and anti-union practices.

### Anarchist Immigration Act (1903)

The Immigration Act of 1903, often called the Anarchist Immigration Act, was designed to bar the immigration into the United States of anarchists and other foreign radicals. In addition to denying entry to anarchists, the act allowed suspected anarchists to be deported within three years after they arrived in the United States. Only a small number of people actually were deported under the law, but it was significant in that it was the first time the CONGRESS sought to deny entry to immigrants based on their political ideas.

The law had a precedent in the Alien and Sedition Acts of 1798, which gave the president the power to deport aliens who were considered threats to the security of the nation. However, the Alien Act was never put into use. It was allowed to expire at the end of two years, due to its unpopularity. Despite other anti-immigrant and antiradical sentiments, no other law was implemented until the late 19th century, when many believed anarchism had become a major threat to the nation.

The Anarchist Immigration Act was a response to the perceived link between anarchism and immigrants. Although not all anarchists were immigrants, immigrant participation in the labor conflicts of the Great Upheaval of the 1880s gave them a reputation for radicalism in the eyes

of many native-born Americans. The association between foreign-born radicals and anarchism was cemented by the Haymarket Riot in 1886. Anarchists in Chicago had called a meeting in Haymarket Square to protest police attacks on workers striking for the eight-hour day. When the police attempted to break up the meeting, an unknown person threw a bomb, resulting in the death of several officers and protesters. The association between anarchism and political violence was so strong that eight anarchists were convicted of murder, despite the lack of evidence linking them to the crime. One of the anarchists committed suicide, and four were executed.

In the aftermath of Haymarket, Congress debated passing a ban on the immigration of anarchists, but all proposals failed to pass or died in committee. In the 1890s, following a wave of anarchist assassinations of European leaders, Congress again considered such a ban, but it did not pass. Finally, the assassination of President WILLIAM MCKINLEY (see Volume VI) in 1901 by Leon Czolgosz, a self-professed anarchist, resulted in Congress's taking action. Ignoring the fact that Czolgosz was a native-born American, McKinley's successor, THEODORE ROOSEVELT, pushed Congress to pass laws to prevent the entry of anarchists into the country, arguing that "when compared with the suppression of anarchy, every other question sinks into insignificance."

On March 3, 1903, Congress responded with the Anarchist Immigration Act, excluding "anarchists, or persons who believe in or advocate the overthrow by force or violence of the Government of the United States, or of all government, or of all forms of law, or the assassination of public officials." The first to be deported under this act was John Turner, a British anarchist on a lecture tour of the United States. However, relatively few people would be deported under this law until the tensions of World War I once again raised people's fears of subversion against the government. Two new laws, the ESPIONAGE ACT of 1917 and the SEDITION ACT of 1918, broadened the 1903 law to include individuals who sought to undermine the American war effort, attacked the U.S. Constitution, or spoke in favor of the destruction of property. The laws remained in force after the war ended as fear of radicals, partly due to the RUSSIAN REVOLUTION, continued under the RED SCARE.

### Anthracite Coal Strike (1902)

The Anthracite Coal Strike was one of the largest and most significant labor disputes between 1900 and 1930.

The strike, which marked the culmination of the UNITED MINE WORKERS OF AMERICA's (UMWA) attempt to organize Pennsylvania coal miners, lasted five and a half months and finally was settled by a special commission appointed by President THEODORE ROOSEVELT. Prior to the strike, there had been numerous attempts to organize the nation's anthracite coal miners. Yet, despite widespread support for organized labor among miners, these early unions proved unable to secure legally binding contracts. In 1890 miners in Pennsylvania formed the UMWA and initially had considerable success organizing the region's bituminous miners. For a variety of reasons, organizing anthracite miners proved more difficult. Anthracite mines had a greater variety of job categories, operated on a larger scale, and had greater ethnic diversity among workers. Their owners were wealthier and more vehemently antiunion.

The UMWA had, without success, tried to organize anthracite miners on several occasions. In 1897, it initiated another organizing effort and quickly succeeded in recruiting new members. Employee opposition, however, remained intense and the organizing drive came to a head. In April and May of 1902, UMWA president JOHN MITCHELL met with mine operators and railroad executives to avoid an industry-wide walkout. When they refused to grant any concessions or recognize the UMWA as a legitimate union, miners voted 57 percent to 43 percent to strike. The strike idled over 140,000 miners. As it lingered on and the nation's supply of coal dwindled, President Roosevelt intervened. He appointed an Anthracite Coal Strike Committee to resolve the differences between the union and financier J. P. Morgan, who was the target of the strike.

Roosevelt, who was establishing a reputation as a foe of business monopolies, and Ohio's Senator Marcus Hanna, who wanted to gain organized labor's support for the Republican Party, saw the 1902 strike as an opportunity to rebuke coal and railroad operators. Roosevelt ordered striking workers back into the mines while the Anthracite Coal Strike Committee gathered information about the dispute. After five months of deliberation, the committee called for a 10 percent pay increase and a reduction in the workday from 10 hours to nine. At the same time, the committee refused to force mine operators to recognize the union and allowed them to maintain an open shop. From a larger perspective, the outcome of the 1902 Anthracite Coal Strike was a break from past practices. Although the committee's ruling was far from a complete victory for the UMWA, the president's refusal to use federal government troops to break the strike or undermine the union marked a change in policy toward organized labor.

### Antiquities Act (1906)

The Antiquities Act, which granted Congress and the president the power to preserve federal lands for historic and scientific purposes, was part of the Progressive Era effort to conserve national resources for the future. Once president, THEODORE ROOSEVELT had the power to put into practice the Conservationism that had changed his worldview. In a comprehensive program, his administration supported the passage of legislation to preserve federal land in national parks, to reclaim land, and conserve, for future use, coal and mineral lands, oil reserves, and forests. Between 1901 and 1909, when he left office, Roosevelt had added to the nation's reserves more than a hundred and fifty million acres, augmenting the 45 million that had already been set aside in the late 19th century. His program, however, dealt with a larger legacy than soil and mineral resources. Roosevelt wanted to protect the nation's geological and historical inheritance as well.

Under his direction, in 1906, Congress passed the Antiquities Act, which granted authority to reserve federal lands for the preservation of historical artifacts and provided for the protection of historic, prehistoric, and scientific sites. The act also granted the president the authority to proclaim public lands as national monuments. Such monuments include geological features, such as Devil's Tower in Wyoming, which President Roosevelt made the first national monument in 1906; archaeological sites revealing Native American cultures, such as the Gila Cliff Dwellings in New Mexico; and places of historical significance, such as Fort Pulaski, Georgia. The Antiquities Act also prohibits excavation or destruction of antiquities without permission of the federal government agency in charge of such lands and authorizes permits for archaeological investigations. In 1908 Roosevelt used the act to proclaim the more than 800,000 acres of the Grand Canyon as a natural monument, which ignored legislative expectations that monuments would be small in area. By 1909 he had created 18 national monuments in addition to the five national parks and 51 wildlife refuges he established while in office. The executive power to create national monuments did not remain uncontested. With the declaration of the Jackson Hole National Monument in Wyoming under Franklin Delano Roosevelt, the act of proclaiming national monuments engendered congressional opposition. Since its inception in 1906, the Antiquities Act has been used more than 120 times to protect the nation's historical and geological heritage in creating or expanding national monuments.

### anti-Semitism

Anti-Semitism, hostility to or prejudice against Jews, has been a prevalent phenomenon throughout history. The history of the United States is no exception. Prior to the turn of the 19th century, however, American anti-Semitism was relatively mild. One of the principal reasons for its relatively moderate character was the small Jewish population. There were fewer than 3,000 Jews in the colonies on the eve of the American Revolution. The number had grown to just under a quarter of a million by 1877. At that time, Jews represented less than one-half of 1 percent of the American population. Few Americans viewed Jewish immigrants and citizens as threats to their personal or professional aspirations.

Among Jewish immigrants, there were degrees of adaptation and assimilation to American society. While some Americans commended Jews as champions of both hard work and thrift, these qualities caused a great deal of concern. Hard work and thrift often resulted in success. Success bred a degree of jealousy and distrust. The social and economic mobility of Jewish Americans alienated others who felt threatened not only by them, but also by the modern society that they seemed to accept. For nativist Americans, Jews were not only unfairly successful in the modern environment; they also came to symbolize it. Other industrializing countries similarly viewed Jewish citizens as a symbol of the evil of the modern world.

Significant increases in the number of Jewish immigrants from eastern and southern Europe further threatened many Americans who had, just decades before, migrated from western and northern Europe. From 1880 to 1914, 16.5 million immigrants arrived in the United States. Of these, more than 1.5 million, or slightly over 10 percent, were Jewish immigrants perceived by nativist Americans as a direct threat to their own social and economic prospects. This perception helped to spawn several strands of anti-Semitism that spread across America at the turn of the century.

There were several different waves of anti-Semitism that plagued the United States in the 20th century. The first emerged in the later part of the 19th century and did not dissipate until the end of WORLD WAR I. The primary force behind this strand of anti-Semitism was fear of modernization. Attacks on Jewish immigrants came from two diffuse, yet interrelated sources. The first was from the quasi-agrarian movements of conservative Populists. After the defeat of the Populist Movement in the 1890s, some turned to anti-Semitism and developed an extremely potent attack on the Jewish "money classes." Demagogues claimed that

Jews were in control of an immense international financial ring that was responsible for much of the pain and suffering that had afflicted the American farmer. They argued that the Jews had made millions of dollars off the blood and sweat of hardworking Americans, an attack that denied that the new Jewish immigrants could be naturalized as “true Americans.” Conservative Populists, however, were not the only group to challenge the Jewish Americans’ rights. Members of the self-identified patrician classes also rallied around an anti-Semitic ideology. They excluded Jewish men and women from their communities, schools, and organizations.

As the popular and patrician challenges to the position of Jews in American society began to wane, other rationales emerged to fill the void. During the 1920s, new forces began to drive American anti-Semitism. The KU KLUX KLAN and HENRY FORD each espoused a unique version of hatred toward the Jewish people. When the Klan of the post-Civil War era had dissipated at the end of the 1870s, its ideology, which largely focused on the problem of race in the South, died with it. When it reemerged in the

1920s, it had a new ideological foundation. The new Klan was far less concerned with suppressing southern blacks. The Klan now championed additional attacks on immigrants, Catholics, and Jews. They viewed both Jewish and Catholic immigrants as antagonistic to traditional American values. The Klan’s more inclusive form of hatred allowed it to develop a tremendous following. By the middle of the 1920s, more than 4 million men and women had pledged their allegiance to the Ku Klux Klan.

Even more influential than the Klan in this era was Henry Ford, the automobile maker. For many Americans, Ford represented, with his ingenuity and success, American society. He used this perception to champion a number of causes, especially the crusade against what Ford believed to be an international conspiracy of Jews. Ford published *The International Jew* and a number of other tracts that told of a vast international Jewish conspiracy. He also used his newspaper, *The Dearborn Independent*, to bring down the alleged conspiracy. His attacks were so relentless that Aaron Sapiro, a Jewish-American lawyer, sued Ford for attacks levied through the *Independent*. After a long court battle, the case was settled. Ford apologized for his comments not only about Sapiro but also about the Jewish community in general. As part of the settlement, he had to stop publishing the *Independent*. Ford may have apologized for his indiscretions, but he never fully repudiated his anti-Semitic stance.

Another factor in American anti-Semitism was eugenics. Eugenics was a pseudoscience that was adopted to promote white supremacy. It came to provide a framework for anti-Semitic ideology and practices. No tract was more important in developing the idea of scientific racism than Madison Grant’s 1916 work, *The Passing of the Great Race*. Grant was just one of the dozens of authors of the time who argued that white Americans were being destroyed by aliens from within. These racial prophets predicted the decline of American civilization if “mongrelization” was not stopped. For Grant, non-whites were polluting the racial stock of the country. He believed that whites should increase their levels of reproduction while others, whom he believed to be less desirable, should be restricted from immigration. Eugenics attacked all nonwhite races, but southern and eastern European immigrants, many of them Jews, were especially targeted by these ideas. The fear and loathing of these immigrants was so acute, that immigration from southern and eastern Europe was virtually halted. Anti-immigration legislation such as the QUOTA ACT (1921) and the NATIONAL ORIGINS ACT (1924) helped stem the immigration by using quotas.

Anti-Semitism in the United States began slowly but developed many institutional and political expressions during the Progressive Era. For many Americans, Jews and modernity were synonymous; for others, Jewish immigrants, especially those from eastern and southern Europe,

Young Jew outside a building on the Lower East Side in New York City, 1911 (Library of Congress)

## 18 anti-suffragists

represented backward cultures and social degeneracy as well as greed and avarice. It was not until after World War II that anti-Semitism began to dissipate.

### anti-suffragists

Once the WOMAN SUFFRAGE cause was reinvigorated in the 1890s, so too was its opposition, the anti-suffragists. While suffragists argued that the vote would allow women to spread their influence and clean up society, their opponents maintained that suffragists endangered society by abandoning the home. Anti-suffrage men and women were persuaded by arguments that, in a culture in which sex roles were defined and separate, the vote threatened femininity and, by extension, society. It would be unnatural, anti-suffragists argued, for women to behave like men by entering politics. Women were believed to be mentally unfit for politics, for they might be corrupted by the rough and tumble masculine world. Other anti-suffragists put forth more overtly self-interested arguments against female suffrage. Political machines and saloon owners, for instance, feared that women's supposed innate moralism would undermine the political, economic, and social status quo just as women's reform efforts jeopardized their livelihoods.

Ironically, some anti-suffragists tried connecting the woman suffrage movement to “un-American” groups, or immigrants, in an attempt to discredit it. Many suffragists, however, made their argument for the vote on the grounds that the votes of middle-class native-born white women would outweigh the votes of “undesirable” elements that already voted. Women would support reform of the corruption and vice associated with urban immigrant life in the eyes of “old stock” Americans. Despite the growing appeal of the suffrage cause, anti-suffragists argued that woman suffrage in the end would have little impact. Pointing to states where women already had the right to vote, they maintained that women did not vote as a bloc and therefore did not bring a distinctive voice to political issues. They also contended that women were not that interested in gaining the vote.

Although anti-suffragist arguments resonated with many voters, anti-suffragism never became as potent a political movement as suffrage. Anti-suffragists, however, did organize to create some effective roadblocks to women's

right to vote. In 1911, the National Association Opposed to Woman Suffrage (NAOWS) was founded by a group of state anti-suffrage organizations. Josephine Dodge was its president. NAOWS helped defeat suffrage referenda in a number of states, including, most notably, Massachusetts. Many NAOWS members were clubwomen who believed that female suffrage diverted women's energies away from women's community-based reform work. Many historians agree that woman suffrage did diminish the single-sex networks and the reform that they spearheaded. NAOWS disbanded after the passage of the Nineteenth Amendment.

### architecture

In the first decades of the 20th century, architecture in the United States reacted to changes produced by the industrialization and urbanization of American society. New building materials, modern conceptions of public and private space, and innovative building functions combined to foster a movement away from classical architecture, with its emphasis on rules and reliance on Greek and Roman styles, toward a modern style defined by individualism and a rejection of historical forms. As the period of transition between the two styles, the years between 1900 and 1930 witnessed an eclectic array of architectural styles and forms.

At the turn of the century, in the renaissance of American architecture, architects designed public buildings of America in the classical styles. The embrace of the classical styles was a reaction to the growing size and diversity of the cities. Architects hoped to create an urban environment that countered urban disorder. Their first efforts were on display at the 1893 World Columbian Exposition in Chicago, where the architects designed the buildings in the classical style. They believed that the buildings built for the exposition, although temporary, demonstrated the effect that classical architecture could have in elevating the spirit of the American people by making connections with Greece and Rome, the great republics of the past. Architects manipulated the classical principles in their designs. Classic architecture had, by this time, been codified and published in handbooks. During the building boom at the turn of the century, it was often difficult for architects to spend time designing every facet of a building. They could, however, use the rules set down in classical architecture as a short cut. Coming at a time of great urban growth and an explosion in office buildings, libraries, railroad stations, and government buildings, classical architecture grew to define city public spaces.

Another architectural development to emerge from the 1893 Columbian Exposition was city planning. The streets of the fair had been rationally designed and laid out. Architects designed city plans in an attempt to impose order on the haphazard growth of cities. Most plans relied on radial streets between important nodes of a city such as rail stations, ports, and civic centers. The goal was to create a healthier urban environment by separating the various functions of a city. The city planning movement did not succeed, principally due to the private character of urban growth.

Concurrent with the efforts of some architects to impose classical order on the new urban environment, others embraced new building types and materials in their designs. In the early 20th century, the skyscraper emerged to define the growth and power of American cities. As city populations exploded and land prices skyrocketed, real estate developers wanted to erect ever-taller buildings, but until the 20th century they were constrained by technology. A complex interaction of technological developments made the erection of skyscrapers possible. The first development was steel-frame construction. Prior to steel frames, buildings were constructed entirely of masonry, which limited the height of buildings to 16 stories, because the walls carried the weight of the materials. The new steel-frame construction dispersed the load of the roof and the walls throughout the frame, making it possible to build skyscrapers. The other technological developments that made skyscrapers possible were fireproofing for steel columns, ELECTRICITY, elevators, and telephones. Electric power made it possible for elevators to run farther and more smoothly, making trips to the top of tall buildings practical. The telephone enabled communication between floors.

The first architects to design skyscrapers simply adopted classical principles and applied them to the different heights of the buildings. They remained wedded to the three-part design of the classical style. The first architect who broke from the reliance on classical principles in building design was Louis Sullivan. Sullivan believed that the design of a skyscraper should be based on a building's structural form and its place in modern life. Moreover, he argued that architects should express their individuality more in their designs. Sullivan rose to prominence in the first decade of the 20th century and helped bring a change to American architecture. Architects had first designed skyscrapers with elaborate bases, columns, and cornices, designs that hid the function of the building beneath a classical façade. Sullivan believed that the design of a skyscraper should embrace its function and form. He therefore simplified the design, letting the sheer enormity of the building speak for itself.

The new industrial economy required an enormous number of factories. Because of their functions, factories

were designed rationally. One of the key developments in factory design was the use of reinforced concrete. This new material met the fundamental requirements of factory design. It was cheap and standardized. It provided clear lighting, ventilation, and unobstructed, flexible interiors that allowed for changes in production facilities. Albert Kahn was the best-known architect working with reinforced concrete. He worked closely with HENRY FORD in designing the automobile factories that made Ford's assembly lines practical.

Some radical architects reacted strongly to the industrial age. One of the first architectural styles to express this reaction was the Arts and Crafts style. Architects of the Arts and Crafts movement used natural materials in designing houses that fit into their settings. The use of natural material and irregular lines emerged as a critique of both classical architecture and the Industrial Age. Arts and Crafts designs critiqued the rationality and artificiality of industrial construction and idealized the preindustrial order. They also rejected the rules of classical architecture that emphasized order and attempted to rise above a building's location.

The architect credited with doing the most to move architecture from the classical style to the modern was FRANK LLOYD WRIGHT. Wright worked in Sullivan's office until 1893, when he opened his own practice. Influenced by the Arts and Crafts movement, he believed that an architect should design buildings that fit naturally into their space and reflect the individuality of the architect. Where classical designs sought to overcome their setting, Wright's designs embraced the American setting, whether it was a property shaped by the grid of the streets or one defined by streams. His long, horizontal rooflines and open spaces reflected wide-open spaces of the Midwest. Wright also accepted the changes that the machine age had brought to American society and used modern materials in his buildings. In rejecting classical principles in favor of his own designs, Wright was the first American architect to create a truly unique style. Other architects followed him in both his reliance on individuality and in adopting his design principles.

Despite the attempts by architects such as Wright and Sullivan to depart from classical design styles, American architecture never fully rejected classical designs before 1930. In fact, classical architecture enjoyed a resurgence during WORLD WAR I. The growth of the federal government during the war created a demand for large office buildings in Washington, D.C. The war effort required that these buildings be erected quickly. Architects turned, therefore, to the familiar rules of classical architecture.

By 1930, the seeds for the emergence of modern architecture had been planted. In reacting to the industrial age, architects had begun to design buildings that embraced

new materials and no longer sought to hide the functions of buildings behind classical facades. In addition, the divergence from classical architecture led to the reliance on individual styles that came to define modern architecture.

## armed forces

At the beginning of the 20th century, the War Department and army still retained the same organizational structure established after the War of 1812. There were two elements to it—a departmental staff and the army in the field, which was separated into tactical units based on geography and under military commanders. A legacy of bureau autonomy and congressional control in managing the affairs of the War Department was considered the principal problem of army organization.

Elihu Root, lawyer statesman, and future Nobel Peace Prize winner, became secretary of war in 1899 under President WILLIAM MCKINLEY (see Volume VI). He immediately set to work at reforming the armed forces. During the Spanish-American War, the absence of planning and preparation, lack of cooperation among the bureaus, and delays due to bureaucratic red tape scandalized the public. Secretary Root believed that drastic changes needed to be made in the War Department if it were to operate effectively during wartime. He wanted to modernize the army and streamline it, based on a corporate model influenced by SCIENTIFIC MANAGEMENT. According to Root, the government could profit from the lessons and experiences of modern industry. Root created the general staff, abolished the position of commanding general, and required that the chief of staff act under the authority and direction of the secretary of war and the president. Many of these changes were instituted in the ARMY ACT of 1901.

In November 1903 War Secretary Root established the Army War College. Its main function was to train officers for general staff duties in military intelligence, congressional liaison, and war planning. During his tenure in office, Root also enlarged West Point, opened schools for special branches of the service, strengthened control over the National Guard, and restored discipline within the department. He resigned in January of 1904.

When Henry L. Stimson became secretary of war in 1911, he instituted more reforms. Along with General Leonard Wood, the army's first executive chief of staff, Stimson reorganized the general staff into the Mobile Army, Coast Artillery, War College, and later Militia Affairs

divisions. The Mobile Army was further broken down into infantry, cavalry, field artillery, and miscellaneous sections. The effort to rationalize and integrate a fragmented and large-scale organization followed principles set out by modern industrial managers. The army and navy conducted further rationalization and efficiency studies.

In 1914 the Army War College issued a report entitled *A Statement of a Proper Military Policy for the United States*, which warned of the dangers of isolationism as foreign policy. It argued that newer military technology, such as the submarine, the airplane, and the wireless telegraph, placed the United States within the sphere of hostile actions of overseas nations. No longer could the nation depend on distance and geography to protect it. War College estimates demanded a standing army of at least 500,000, with a reserve of equal force. They also called for arms and training programs.

The NATIONAL DEFENSE ACT of 1916 defined the roles and missions of the regular army, the National Guard, and the reserves, placing the Reserve Officers' Training Corps (ROTC) and the Plattsburg idea (training for reserve officers) on firm footing. The law reduced significantly the number on the general staff, and the Mobile Army Division was abolished. After declaring war on Germany, however, Congress passed emergency legislation increasing the size of the general staff again. The National Defense Act allowed the president to commandeer factories and establish a government nitrate plant. It also doubled the size of the army by adding 11,450 officers and 223,580 enlisted men in annual increments over a five-year period. The National Guard was allowed to expand to 17,000 officers and 440,000 men. A corresponding naval appropriations bill widened the effect of the measure as naval expenditures rose. After diplomatic relations with Germany broke down, in 1917 President WOODROW WILSON ordered the arming of American merchant ships to defend themselves against U-boat attacks.

In spite of the National Defense Act, the nation would be unable to recruit up to the authorized number. In consequence, ground forces of the army numbered only 128,000 when America entered WORLD WAR I. The SELECTIVE SERVICE ACT of 1917, which required that all men between the ages of 18 and 45 to register for the military draft, was used to bolster the military. Twenty-four million men registered, and the army was increased to 4 million soldiers. Congress increased appropriations for training and equipping the new AMERICAN EXPEDITIONARY FORCE for use in the European theater of the war.

The U.S. Navy was the second largest in the world when the United States entered the war in 1917. The navy focused on building the submarine chasers and destroyers needed to protect American ships. There were 35 U.S. destroyers stationed at Cob in Ireland by July 1917. By the end of the war, more than 380 U.S. craft were stationed overseas. In

addition, Congress provided for the growth of the Merchant Marine under the UNITED STATES SHIPPING BOARD.

Immediately following World War I, Congress rejected the principle of tight executive control or unity of command in the army. The National Defense amendments of June 4, 1920, returned to the prewar pattern of fragmented authority and congressional supervision. In a 1920 act, Congress reaffirmed the traditional military. The nation continued to rely in peacetime on a small standing army supported by a citizen's militia, the National Guard, and military activities. The 1920 amendments also provided for a War Council made up of the secretary, assistant secretary, JOHN PERSHING, the general of the armies, and the chief of staff for the purpose of discussing and formulating military policy. It was, however, of little practical use, as the War Council did not meet on a regular basis.

During the interwar period, the navy continued to develop, despite the disarmament agreements signed at the WASHINGTON CONFERENCE ON NAVAL DISARMAMENT. In contrast, the army between the wars saw drastic reductions in number. Until the late 1930s, the army had little more than a peacetime force of less than 150,000 men in nine divisions, none of them ready for combat. The army's reputation and morale suffered from budget cuts and disillusionment over America's role in World War I. A major change in the organization of the War Department happened between the wars as army airmen strove to establish an air service separate from the ground forces. General WILLIAM "BILLY" MITCHELL and others led the effort. In 1926 the War Department finally organized the Army Air Corps with its own chief. Like the Senior Service, the Army Air Corps remained small and undeveloped. The isolation of the interwar years kept the military small and expenditures low, despite growing world tensions.

### Armory Show (1913)

The International Exhibition of Modern Art, popularly titled the Armory Show, was an enormous art exhibition held in New York City, from February 17 to March 15, 1913. The exhibition, housed in the New York Guards Sixty-ninth Regiment Armory, consisted of an estimated 1,600 works of art. The show was a critical turning point for art, exposing the American public to early modernist art and providing an opportunity for modern works to be purchased by collectors. The Armory Show made an impression on the public and initiated many American collectors, whose

support was essential, to modern art. Many of their acquisitions were built out of the Armory Show and became part of many major art museum collections.

The idea for the show itself came from a group of American artists who were frustrated with the restricted exhibitions of the National Academy of Design. They wanted to establish a more open market for exhibitions and create more patronage opportunities. What the Armory Show revealed was the division in American taste. Conservatives disapproved of the show, claiming it as un-American. They associated it with the anxiety many Americans felt at the rapid change of their society under the pressure of immigration.

The Armory Show consisted of American and European-themed sections, exhibiting various mediums of painting, decorative arts, sculpture, watercolors, prints, and drawings. Gallery space was divided into 18 rooms, with the American rooms assigned to the large entry hall and additional rooms flanking each side of the building. American artists included John Marin, Childe Hassam, J. Alden Weir, Margaret Hoard, and Edith Dimock. European sections were primarily housed in the central area of the gallery, showing works by Francisco de Goya, Ferdinand Delacroix, Gustave Courbet, the Impressionists, and leading contemporary artists such as Marcel Duchamp and Vasily Kandinsky. It was the European section that generated the most public interest and became the focus of controversy. There was a good deal of criticism and ridicule, particularly directed at Marcel Duchamp's *Nude Descending a Staircase*, but there were also many positive reviews.

In the spring of 1913, the show traveled from New York to Chicago and Boston, creating an enormous impact. It was estimated that over a quarter of a million visitors paid to see it. The Armory Show created a climate more favorable to experimentation and had a profound effect on many young American artists. Important patrons and collectors such as Louise Arensberg, Arthur J. Eddy, and Lillie P. Bliss made their first purchases of modern art from that exhibited at the Armory Show.

The Armory Show was a major event in American art history. It had a tremendous impact on artists, collectors, and the art market. The show balanced American and European standards of reference in progressive art, shaking the rigid structure of the art market. There was an increase in museum attendance, and more art books were published and purchased. Modern art was now publicly accepted with more confidence.

**Army Act (1901)**

In response to the changing needs of the U.S. Army, Secretary of War Elihu Root proposed to reorganize the armed forces. Following his lead, CONGRESS passed the Army Appropriations Act of 1901. The Army Act, as it became known, addressed the weaknesses that the army had shown in the recent Spanish-American War, and it laid out the organization of the modern American army. It also established guidelines for American intervention and governance in Cuba and the Philippines.

Root, a lawyer, statesman, and future Nobel Peace Prize winner, became secretary of war on August 1, 1899. He brought to the War Department administrative reforms and a new mission for the army. During the Spanish-American War, Root noted, the lack of planning and preparation, failure of cooperation, and bureaucratic red tape led to inefficiency in the military. Root was determined to improve this record. He believed a modern army required an operation akin to modern industrial corporations. In his efforts to reform the military, he abolished the position of commanding general and instituted the position of chief of staff acting under the authority and direction of the secretary of war and the president. He established a General staff, founded the War College in Washington, and expanded West Point.

Elihu Root (Library of Congress)

Secretary of War Root was most concerned, however, with the three dependencies the United States acquired at the end of the war. He devised a plan for returning Cuba to the Cubans and supplanting military rule with a civilian charter in the Philippines. Root designed amendments to the Army Act that would accomplish his goals, and Senator Orville Platt of Connecticut presented it to the Senate.

The Platt Amendment was attached as a rider to the Army Act. It set the conditions for the withdrawal of troops remaining in Cuba since the war. The Platt Amendment mandated that Cuba adopt into its constitution a provision that prohibited it from transferring land to any country other than the United States. Further, the United States acquired a lease to land on Guantánamo Bay as a result of the treaty. The U.S. Navy built Guantánamo Bay Naval Base in 1903. Cuba had limited rights in negotiating treaties, and the United States could intervene, if necessary, for mutual protection and the preservation of "Cuban independence." Cuba incorporated the articles into its constitution. The Platt Amendment remained in force until in 1934 President Franklin D. Roosevelt, under the Good Neighbor Policy, gave up the stipulated rights of the United States, except its naval base.

The Spooner Amendment to the Army Act established an end to U.S. military government of the Philippines, which Spain ceded to the United States in the Treaty of Paris. Philippine nationalists had assumed that they, like the Cubans, would be given their independence once the treaty had been signed. The Senate, however, refused to pass a resolution to this effect. There was consequently much Philippine bitterness toward the United States. Resistance to the American occupying forces erupted into a guerrilla war with the Moro insurrection in February of 1899. Fighting was prolonged and vicious between the American troops and the Filipino guerrillas, led by EMILIO AGUINALDO. The American army finally put down the resistance in 1901, but sporadic guerrilla fighting continued for months after.

In July 1901 President William McKinley established a civilian government in the Philippines, to be headed by WILLIAM HOWARD TAFT. Elihu Root wrote a democratic charter for the governance of the Philippines designed to ensure a free government, protection of local customs, and the promise of eventual self-determination. Despite this promise, the United States maintained a military presence in the Philippines throughout most of the 20th century. The Army Act's reorganization of the armed forces similarly remained intact for most of the century.

## art

At the beginning of the 20th century, art was undergoing a process of transformation. Traditionally, art was expected to serve as a civilizing and inspirational force, a carryover from the Victorian ideals of the previous century. A new generation, however, struggled to redefine the role of art. Many artists were impatient with the standardized, approved academic form and struggled to be recognized as American artists, rather than artists in America. These artists worked against cultural norms of the time.

American high culture valued art that exhibited the traditional ideals of discipline and restraint, not artistic individualism and freedom. American neoclassical artists Kenyon Cox and Abbott Handerson Thayer worked within these traditional academic forms. In order to avoid overt personal expression, they used the standard models of art: smooth-painted surfaces, detailed execution, crisp outlines reminiscent of the French-derived neoclassical art. Drawing on images and symbols of the past, Cox and Thayer portrayed order and harmony. They believed in the civilizing power of art, creating work that was academic, mythical, and standard in form. ARCHITECTURE of the time also followed neoclassical standards. Many monuments, sculptures, and murals were executed for public buildings during this period.

Society portraitists used their subject matter to focus on the private experience and personal gesture, rather than the classical imagery and controlled style of neoclassical art. In illustrating the domestic world of refinement, portraitists chose romantic idealism over honesty or duty toward the public world. John Singer Sargent's work embodied the English and German tradition of society portraiture. Other artists such as Cecilia Beaux, John White Alexander, and Charles Hawthorne took their cues from Sargent, composing a world of refined elegance distanced from the harsh reality of contemporary life. As artists, they were "safe" in a technique removed from actual experience. Thomas Eakins, a painter from Philadelphia, along with his pupil Thomas Anshutz, began to illustrate the change from romantic idealism to realistic and more contemporary life portraits. Eakins's portrait, *The Thinker: Portrait of Louis N. Kenton*, combined thoughtful pensiveness with native realism, illustrating the ambivalence of an individual contemplating an uncertain future. In a similar style, Anshutz's portrait, *A Rose*, reflected the upper-class world at the turn of the century. It portrayed a reflective, confident woman, something modern America would confront in the near future. Anshutz's work laid the foundation for the urban realists who would later emerge in New York under the leadership of his pupil Robert Henri.

Henri was a realist painter who observed the activity around him. Unlike his predecessors, his scenes were almost exclusively urban. He also changed the focus and

function of art. He believed that art must be a record of daily life with no glossing over its harsher aspects. The academic, mythological scenes of the past had no part in his art. The motion and activity of the urban streets were where Henri's perspective lay.

Exhibition opportunities for American artists were controlled almost exclusively by two New York-based institutions—the Society of American Artists and the National Academy of Design. When the two organizations merged in 1906, the jury's exclusion of works by several of Henri's friends, and two of his own works, provoked a controversy. Henri, a man who believed that art must reflect the spirit of the time and nation, became so frustrated by the lack of artistic vision, that he and his colleague John Sloan arranged for their work to be exhibited at the MacBeth Galleries. In February 1908, "The Eight" opened the Exhibition of Paintings. Known as the ASHCAN SCHOOL of artists, this group had enough experience as journalists to know how to market themselves and promoted their ideas of independence and freedom along with a distinctly American point of view.

In an attempt to address the lack of exhibition opportunities and patronage that artists were facing, Robert Henri and his colleagues organized the 1910 Independents Show. It had only limited success, because of its stipulation that any artists applying to the show were not allowed to submit paintings to the National Academy that year. The group then began discussing the possibility of exhibiting a more ambitious show of American art. In January 1912 a group of 25 artists formed the Association of American Painters and Sculptors. The relatively conservative J. Alden Weir was selected as president. Unable to find an exhibition site after a year and faced with the resignation of Weir as president, the group persuaded Arthur B. Davies to take over. Davies satisfied both conservative and realist factions. He sought to break from the well-established American aesthetic provincialism and successfully pushed for the association to include European art in its exhibition.

The International Exhibition of Modern Art opened its doors on February 17, 1913, at the armory of the New York Guards Sixty-ninth Regiment. Popularly known as the ARMORY SHOW, the exhibition originated out of artists' concerns over the lack of exhibition opportunities and patronage that American artists faced. The impact of the show was incredible, closing the gap between American and European standards of reference. The reaction of the press elevated the show to a position of prominence by labeling its unconventional inclusions MODERNISM. Thus, a foundation for modern art was established, giving it a stature more equal to that enjoyed by European art.

Other traditional artistic forms of the past were giving way to artistic expression, and they reflected the rapid

impact that industrialization had on American culture. Artists began to draw on their experiences and in ways that were seen in the American urban landscape—where the power of American modernity opened up. Artists used the city to express what it meant to be American. Symbols of progress and futurity were the urban architecture of skyscrapers, electric streetcars, automobiles, elevated trains, and subways.

One of the first artists to use this urban landscape style was Alfred Stieglitz, through the medium of photography. Other artists also turned their attention to the urban landscape. Childe Hassam used New York street scenes, skyscrapers, and bridges to achieve the idea of mood and nature, and artists like Jonas Lie responded to the powerful force of American urban life. He painted a scene of industrial steamers at work on the river, their billowing clouds of steam serving as a metaphor for American prosperity and power. John Sloan's painting *Sunday, Women Drying Their Hair* used scenes from the lives of working-class women, revealing his understanding of their freedom. In his painting, they appeared unconfined by the more rigid codes of conduct and behavior expected of middle-class women.

Other urban scenes reflected the growing forces of American social reform, where artists used their art as a tool for social change. Abastenia St. Leger believed artists had a duty to be responsible to others, and her 1913 sculpture of a young woman being auctioned into prostitution was reproduced on the cover of *The Survey* magazine. By the 1920s, artists were engaged with questions concerning issues such as WOMAN SUFFRAGE, BIRTH CONTROL, racism, Freudian analysis, and SOCIALISM.

*Forum* magazine sponsored the Forum Exhibition of Advanced American Painters in order to advance the public's understanding of abstract art. The realists also sponsored an exhibition at the Grand Central Palace in New York on April 10, 1917, to encourage the country's enthusiasm for American art and the realist agenda. Unfortunately, public attention centered around a dispute over whether or not the organizers would accept Marcel Duchamp's controversial *Fountain* into what was supposed to be an unjuried exhibition. Another reason for the failure of the show was that four days before it was scheduled to open, America declared war on Germany.

The wartime prosperity and the proliferation of new technology and machines allowed Americans to raise industry into a national religion. Communication transformed public life. Domestic machines converted American society into what was thought to be a more efficient, hygienic, mechanized environment. The impact of machines was so pervasive that many people referred to it as the machine age. Businessmen and engineers became the predominant icons of the era.

Technology associated with the United States penetrated the American consciousness in the 1920s. Precisionism was the American version of the "call to order" that swept Europe after the war. Initially labeled cubist, precisionism gave geometric lines to architectural and machinist subjects and expressed stability and permanence. Charles Demuth and Preston Dickinson were two artists who focused on exploring abstract arrangements of flat, uncomplicated shapes without giving up recognition.

The United States became more isolationist in the twenties, reflecting a period of contradiction and excess. Opulence found expression in art through decoration and adornment. The discovery of King Tutankhamen's tomb brought the popularity of Egyptian art to the United States. The carefully organized patterns of Art Deco built upon the popularity of technology and Egyptian art, mixing the ancient with the modern. Artists Florine Stettheimer and Paul Manship expressed the deco movement with their highly ornamented and stylized motifs. This movement drew from earlier, more orderly and tranquil times, while incorporating materials and inventions of the modern world.

Discussions about identifying what was uniquely American became more commonplace, spreading along with the nationalist fervor in the 1920s. Americans wanted to identify what was uniquely American. Stuart Davis was an artist who combined modernism with his vision of contemporary America. He condensed contemporary American culture through collage-like painted images, incorporating themes of jazz, radio, movies, consumer products, and ADVERTISING. Davis restrained the idea of three-dimensional space and provided visual movement by adding dots, stripes, dashes, and grids. His street scenes also controlled dimension, but they portrayed a particular place. Davis's work illustrated the fascination art had for the visual expressions in advertising.

Themes of art shifted along with American demographics, going from the rural to the urban. American scene painters believed that realism was an attitude toward life and humanity. Edward Hopper's work focused on melancholy and isolation, derived from his sense of a loss of values and an abandoned way of life. He identified with an American past that had been rendered obsolete and transformed it into universal and timeless commentary on the human condition.

The search for American identity also was evident in the HARLEM RENAISSANCE, which began with the migration of a new generation of African-American artists to Harlem. It had as its consequence, an attempt to cultivate racial tolerance by promoting the cultural accomplishments of African Americans. Concentrations of African Americans in cities provided a new sense of self-determination and opportunity. The incorporation of African art and so-called

“El Capitan in the Yosemite Valley,” by Ansel Adams (*Library of Congress*)

primitive culture integrated modernism with international themes.

American abstract art flourished in the 1920s. Those interested in pursuing art outside the realism genre were encouraged by new galleries and patrons that emerged after the 1913 Armory Show. Alfred Stieglitz ran one of those galleries. In 1925 he opened an exhibition called the “Seven Americans,” and nine months later he opened the “Intimate Galleries.” His intent was to support the work of American artists committed to the creation of a national culture, and he considered the focal point of that culture to be the land. These artists viewed mechanization as psychologically damaging and saw nature as a means for spiritual wholeness.

Artists such as Arthur Dove, Georgia O’Keeffe, John Marin, and Oscar Bluemner created organic shapes, drawing out nature to its essential quality in order to translate its mystical essence into powerful abstract forms. The transcendental connection is apparent in Dove’s work. He had a complex personal style that worked with nature and modern movement in his painting. O’Keeffe’s geometrically inspired botanical themes represented expressive, luxuriant visions of nature. Marin saw the architecture in nature very

much like the architecture of urban areas, referring to the pushing and pulling of natural forces. Bluemner reduced landscape motifs to bold color planes, seeing color as a “visible creative force.”

Artistic debates over which type best represented American national identity continued. But on October 29, 1929, the stock market collapsed, and along with it went the sense of prosperity that Americans had been experiencing. President Franklin Delano Roosevelt’s most urgent duty was to find relief and promote recovery of the nation’s economy. Art and its institutions continued to change in response to the growing economic crisis and the political message of the New Deal.

## Ashcan school

The Ashcan school is a term that came to define a group of promising young artists in the early 20th century. They chose to paint from what they could see in their world. The bustling life of New York City provided a wealth of subject matter. A critic who did not appreciate their choice of subject—alleys, tenements, and slum dwellings—coined the term Ashcan school. The motivation behind the artistic group was to bring art and life together in an American version of realism and naturalism.

No group of artists better defines the movement than “The Eight” of the Ashcan movement. The original Eight was composed of Robert Henri, the leader, John Sloan, Arthur Davies, Ernest Lawson, Maurice Predergast, Everett Shinn, William Glackens, and George Luks. Other promising artists of the era, such as George Bellows, were considered to be part of the group. Each of the artists had his own take on life in the city. Luks, Sloan, Glackens, and Shinn were newspaper illustrators and cartoonists.

Robert Henri taught at the Art Students League and other schools in New York City. He championed exhibitions, but he did not grade art. Henri promoted the idea that art was in the eye of the beholder. He summed up his personal philosophy and the movement’s when he told his art classes to “forget about art and paint pictures of what interests you about life.” For these artists, the strain and struggle of urban life was what fascinated them. They were known to create “art for art’s sake.” They broke from

conventional notions that art could be viewed broken down and dissected to determine its worth. The artists of the Ashcan school defined art within the context of life. Henri noted that “the object isn’t to make art, it’s to be in that wonderful state which makes art inevitable.” These artists wanted to experience life; through life, they would be able to produce art.

The Ashcan school began to disintegrate as it gained notoriety. In 1908 the Eight exhibited their work at the Macbeth Gallery. They soon earned a dubious reputation as the apostles of ugliness. The ugliness was not a comment on their abilities as artists; it was an attack on their subject matter. This form of creativity began to attract a sizable following. Within a short time after the showing, the group was incorporated into a larger, more diverse group. Edward Hopper, Glenn Coleman, Eugene Higgins, and Jerome Myers were other prominent members of the emerging Ashcan school. Later on they sponsored the ARMORY SHOW of 1913, which exhibited many new European painters as well.

This Ashcan school helped form the base from which 20th-century American painting developed. In the process, these New Yorkers created an American style of art that would profoundly rebel against the tradition of European artistic interpretations. It was, as Henri had hoped, art for art’s sake.

## automobile industry

The emergence of the automobile industry in the early 20th century had a dramatic impact on American society. Perhaps no other technological invention has so fundamentally altered the way ordinary Americans lived. Important innovations in the production of automobiles took place between 1860 and 1890, but it was the introduction of MASS PRODUCTION and widespread automobile ownership between 1900 and 1930 that had the greatest impact. Prior to 1900, automobiles were handcrafted one by one. These early automobiles were unreliable and very expensive. The early automobile industry was centered in the region around Detroit, Michigan and Toledo, Ohio, in part because that was where the bicycle industry was located. Early automobiles incorporated much of the technology used in the bicycle industry and employed the industry’s skilled machinists. By 1900, dozens of small automobile manufacturers were springing up in Detroit. Many of these early manufacturers, including HENRY

FORD, built automobiles only after they had received an individual order.

Automobiles began to be mass produced in the first decade of the 20th century. The introduction of precision-made, interchangeable parts and assembly-line labor between 1900 and 1910 allowed manufacturers to increase production. From the beginning, demand for the automobile was widespread. In 1900, Americans owned 2,500 automobiles, and by 1910 the number had jumped to over 450,000. Automobile manufacturers attempted to meet this demand through mass production. First attempted by Ransom E. Olds, it wasn’t until Henry Ford introduced the Model T Ford in 1908 that a reliable automobile became affordable for the average citizen. The no-frills Model T came in only one color (black) and cost a modest \$850. Its popularity was phenomenal. Between 1908 and 1927, the Ford Motor Company sold 15 million Model Ts. The key to Ford’s success was his ability to automate virtually every aspect of the automobile’s construction and to continually find quicker and more efficient methods of production. With the opening of the Highland Park plant in 1910, Ford was able to reduce the time it took to produce an automobile from 728 minutes to 93 minutes. The more cars Ford produced, the cheaper they became, and the more he sold. Ford dominated the auto industry between 1910 and 1920. Sales of Ford automobiles doubled nearly every year, from 13,840 in 1909 to 189,088 by 1913.

Although Ford quickly emerged as the dominant automobile manufacturer, he had many competitors. In 1908, the year Ford introduced the Model T, there were more than 50 manufacturers. That same year William C. Durant formed the General Motors Corporation (GM). Unlike Ford who was obsessed with creating a utilitarian automobile, Durant dreamed of controlling the industry and creating expensive luxury cars. Between 1908 and 1910, he bought out 11 competing automakers, including Cadillac, Buick, Oldsmobile, and Pontiac, but his spending spree left General Motors virtually bankrupt. The fortunes of the company changed when Alfred P. Sloan took control in 1923. Under his direction, General Motors attempted to increase sales and market share by making its automobiles stylish. The company hired artists and designers and sold cars in many different makes, models, and colors. As automobile ownership became more common, consumers placed increased importance on style and design. As competition over sales increased, other innovations took place as well. These included safety features and larger and more powerful engines. Sloan hoped that by constantly changing model styles and colors and introducing new features, consumers would buy new cars more frequently. They would want to buy the latest model and gadget. By 1930, GM was introducing new models every year. Ford, however, steadfastly refused to follow suit. When Ford refused to offer the Model T in any other color than

Row of completed "Tin Lizzies," or Model Ts, come off the Ford assembly line. (Hulton/Archive)

black and resisted other design changes, GM was able to dramatically increase its share of the market. By 1930, it had become the largest automobile manufacturer in the country. GM, Ford, and the Chrysler Corporation (formed in 1925) had become large and powerful enough that they were able to produce higher quality automobiles at lower prices than their competitors. One by one, medium-sized car manufacturers were either forced out of business or bought out by the Big Three automakers.

The emergence of the auto industry had an important impact on labor-management relations. The industry's growth meant that hundreds of thousands of workers were now employed by the auto manufacturers, parts suppliers, repair shops, and other related industries. When Ford's Highland Park plant opened in 1910, it housed more than 3,000 employees under one roof, a staggering number

especially considering that in 1903 the company had no more than several dozen employees. By 1917, the Highland Park workforce had increased to 36,000. The pace and nature of autowork changed as well. These changes included the introduction of conveyor belts, the assembly line, and interchangeable parts. Prior to these changes, skilled craftsmen and their assistants typically manufactured one automobile at a time. Using principles of SCIENTIFIC MANAGEMENT, the production process was broken down into isolated stages. Precision machines produced interchangeable parts, which were brought to workers on conveyor belts, where they performed routine tasks of assembly hundreds of times a day. Many skilled machinists who helped the auto industry get off the ground found the new assembly line production repetitive and tedious and began looking for work elsewhere. The turnover rate

at Ford in 1914 was more than 300 percent, despite a \$5-a-day wage. The pace of assembly line production also changed the nature of work in other industries. Foremen were hired to push the pace of work. The 1917 opening of Ford's River Rouge plant marked the culmination of the changing nature of work in the auto industry. Built on one thousand acres, the Rouge plant was itself a model of the new industrial workplace. The plant had its own railroad and power supply, and it was almost completely self-sufficient. These changes in the nature of work took place over the course of many decades, but the emergence of the auto industry made them widespread and permanent.

The expansion of the auto industry caused other important changes in American society. Prior to 1900, the nation was still predominantly rural and agricultural. In 1920, for the first time, the Census revealed that more than 50 percent of the population lived in urban areas. The large number of workers employed in the auto industry and the mobility created by automobile ownership helped facilitate the growth of urban America. By 1929, there were 26.7 million registered automobiles. In response, federal and state governments built hundreds of new highways. Federal initiatives included the Federal Aid Road Act of 1916 and the Federal Highway Act of 1921. As the ownership of automobiles became more common and thousands of miles of new roads were built, Americans enjoyed a newfound freedom to go places where they had never been and to travel on their own schedule. People used the automobile to get to work, the grocery store, the city, the country, and to visit people and places that would otherwise have been difficult to see. The nation fell in love with its automobiles and would never be the same again.

—Robert Gordon

## aviation

Attempts to attain flight date back hundreds of years; but by the turn of the 20th century, the concentrated efforts of inventors both in the United States and worldwide made the first flight only a matter of time. Two American mechanics, Orville and Wilbur Wright, became the first men to put a plane in flight. On December 17, 1903, the WRIGHT BROTHERS managed to send aloft a 120-foot plane for 12 seconds at Kitty Hawk, North Carolina. Before this, people had flown only in balloons and gliders. The first person to fly as a passenger was Leon Delagrangé, who rode with a French pilot traveling from a meadow in 1908. The Wrights' passenger, Charles Furnas, was the first American airline passenger at Kitty Hawk. From these beginnings,

aviation would come to revolutionize communications and transportation in both the civilian and military sectors, making airmail and air freight regular components of daily life and airline service a principal means of transportation by mid-century.

In the 1910s, aviation struggled along, and the few flights occurring always created news. Most people were afraid to ride. When WORLD WAR I began, however, the military value of aircraft was quickly recognized. The production of airplanes was increased. Elementary planes were first employed for battlefield observation in Europe, and only later were they used for aerial bombardment and air combat. Improvements, especially in the development of more powerful motors, enabled aircraft to reach 130 miles per hour, more than twice the speed of prewar planes. More power made larger aircraft possible. American pilots were among the first Americans involved in the European war and formed the Lafayette Escadrille of the French air service. General WILLIAM MITCHELL was instrumental in expanding the military use of airplanes, and in 1918 he proposed the first airborne assault.

Civilian aviation continued to develop during the war. By 1917, the United States government decided to try the transport of mail by air. The first regular service between Chicago and Cleveland began on May 15, 1919. Airplanes were not able to fly at night, and so they handed off the mail to trains at the end of the day. Regardless of this obstacle, the Post Office was able to save 22 hours off mail delivery from one coast to the other by utilizing planes. In 1921, the army first implemented beacons on the route from Columbus to Dayton, Ohio, which made night flight possible. The system was soon to be expanded.

The decade of the 1920s witnessed the beginning of commercial airline service, airmail, and air freight. In 1925, Congress passed the KELLY AIR MAIL ACT, which established contracts with commercial airlines for the delivery of U.S. mail by air. By the mid-1920s, the Post Office mail fleet was flying 2.5 million miles and delivering 14 million letters annually. The Kelly Air Mail Act was the first step toward the creation of a private U.S. airline industry. Five companies—National Air Transport, Varney Airlines, Western Air Express, Colonial Air Transport, and Robertson Aircraft Corporation—won the first contracts. The Post Office had always used the private sector to move the mail, so it was in keeping with that tradition that private air carriers contracted to deliver mail. Awarding of contracts also spurred the development of several additional airlines. Once the Kelly Air Mail Act was passed, the private carriers who were doing air transport for the United States Post Office expanded into carrying other forms of cargo, and eventually passengers.

The same year Congress passed the Kelly Air Mail Act, President CALVIN COOLIDGE formed a board to

recommend a national aviation policy. Dwight Morrow, the future father-in-law of CHARLES LINDBERGH and senior partner of J. P. Morgan, headed the board. The report advised that the government set standards for the air industry and left the military out of the equation.

The Air Commerce Act of 1926 provided for federal regulation of air traffic rules. The legislation authorized the secretary of commerce to designate air routes, develop air navigation systems, license pilots and aircraft, and investigate accidents. Congress also amended the Kelly Air Mail Act by simplifying the payment system. It changed the basis of payment from percentage of postage to weight hauled.

Once airlines addressed flight safety issues, passenger volume increased and new airlines opened up, thereby reducing air fares. This reduction, in turn, increased traffic. Airlines were fully in favor of the passage of the Air Commerce Act of 1926, as with it they had government support in realizing the commercial potential of the air industry.

A landmark event took place in 1927 when airmail pilot Charles Lindbergh flew the first solo transatlantic flight from New York to Paris. Called “the Lone Eagle,” he landed his plane, *The Spirit of St Louis*, at Le Bourget after a flight of 33 hours and 30 minutes. As a new national hero, Lindbergh became one of the nation’s new experts in aviation.

The expansion of air freight and passenger services increased demand for planes. In 1927, the Ford Motor Company geared up production for aircraft manufacturing. Ford first produced the Ford Trimotor, or Tin Goose. It was one of the first all-metal planes made of duraluminus, a material as light as aluminum but twice as strong. It also was the first plane designed for passenger conveyance. It

had 12 seats and room for a stewardess, the first of whom were nurses, to serve meals and assist airsick passengers.

By 1930, there were 43 airlines flying 385,000 passengers a year over routes of 30,000 miles. In 1930, Postmaster General Walter Brown pushed for legislation known as the Watres Act, which allowed the Post Office to enter into long-term contracts for airmail with rates to be based on space or volume rather than weight. Immediately after the bill was passed, Brown held a little-advertised meeting to distribute new contracts. This was called the “Spoils Conference,” as only a handful of the larger airlines were invited. Two years later, Brown’s actions drew public criticism.

Airlines complaining about the “Spoils Conference” demanded an inquiry into the awarding of contracts. Congressional hearings finally were held in 1934, and the scandal caused President Franklin Delano Roosevelt to turn over the delivery of mail to the army. Chaos ensued as weather turned bad, and pilots, unfamiliar with routes, caused accidents. The plan was quickly overturned as publicity forced Roosevelt’s hand. The Air Mail Act of 1934 returned airmail transportation to the private sector, but it added a number of restrictions to increase competition. Aviation continued to develop as a major aspect of communication and transportation in the period.

**Baldwin, Roger Nash** (1884–1981) *director, American Civil Liberties Union*

Founder and longtime director of the AMERICAN CIVIL LIBERTIES UNION, Roger Baldwin was born in Wellesley Hills, Massachusetts, in 1884, the son of Frank Fenno Baldwin and Lucy Cushing Nash. After receiving bachelor's and master's degrees from Harvard University, Baldwin taught sociology at Washington University and began a career in social work. During these years, he served as chief probation officer of the St. Louis juvenile court and coauthored *Juvenile Courts and Probation* with Bernard Flexner. His years in St. Louis exposed Baldwin to the labor movement and radical politics, connections that shaped his perspective on issues of social justice and, in particular, the failings of the legal system.

As the United States began to prepare for war in Europe, Baldwin moved to New York. He became an early leader of the American Union Against Militarism (AUAM), which opposed American entry into WORLD WAR I, and fought for the rights of conscientious objectors and dissenters against the war. The AUAM created the National Civil Liberties Bureau (NCLB) to defend conscientious objectors, members of the INDUSTRIAL WORKERS OF THE WORLD, immigrants threatened with deportation for political reasons, and other wartime dissidents. Baldwin was central to these efforts. A lifelong pacifist and Unitarian, Baldwin deliberately violated the SELECTIVE SERVICE ACT and served a year in prison. In 1919, he returned to New York with his wife, Madeleine Doty. When the postwar RED SCARE continued to target opponents of war, labor unions, and political groups, several Progressives saw the need for a more permanent organization. From the NCLB, Baldwin and radical lawyer Crystal Eastman formed the American Civil Liberties Union (ACLU) in 1920. Roger Baldwin was its first director, a post he held until 1950.

Baldwin's political philosophy was rooted in pacifism, and he was a libertarian only in the legal and political sense.

While he fought social injustice on a broad scale, he was more committed to CIVIL LIBERTIES than to any socialist ideal. He took inspiration from both the IWW's FREE SPEECH FIGHTS and the RUSSIAN REVOLUTION, but he was not a committed leftist. His civil libertarianism leaned, instead, on voluntary political action and a celebration of free speech, free press, and freedoms of religion and of assembly as the central tenet of American democracy. Baldwin understood how the free exchange of ideas was hampered by the innate conservatism of many Americans, and he feared that their desire for homogeneity left the prosecution of political dissidents unchecked. During these years, Baldwin took up unpopular causes such as contesting the conviction of SACCO AND VANZETTI, challenging laws that prohibited the teaching of evolution in the schools in the SCOPES TRIAL, and trying to break the publication ban on James Joyce's novel *Ulysses*. Fighting censorship, arbitrary restrictions on civil liberties, and political or unjust imprisonment were among Baldwin's many causes.

In the 1930s Baldwin divorced Doty and began a long-term relationship with Evelyn Preston, with whom he shared a daughter and two stepchildren. With growing connections with the New Deal and the Roosevelts through his new partner, Baldwin sought mainstream political affiliations. The decade saw Baldwin choosing to defend the Scottsboro Boys, African-American teenagers facing the death penalty for a crime they did not commit. At the same time, Baldwin rethought his earlier admiration of the Soviet Union and repudiated the COMMUNIST PARTY in the wake of the purge trials and the Nazi-Soviet Anti-Aggression Pact in 1939. Baldwin also targeted left-wing members of the ACLU board. Communist Party member ELIZABETH GURLEY FLYNN, one of the organization's founding members, was expelled, and the ACLU became embroiled in anticommunist politics. While it soon turned toward the defense of those victimized by McCarthyism, the ACLU also maintained a distance between its political stands and those of its clients.

Baldwin's desire to preserve the ACLU was first and foremost the cause of the ACLU's more critical stance toward Progressive and radical causes. At the same time, Baldwin defended the rights of individuals from across the political spectrum, both nationally and internationally. After World War II, he was cofounder of the International League for the Rights of Man and helped Japan, Germany, and Austria create their own national civil liberties organizations. To paraphrase Baldwin, he preferred "the rule of law" to the rule of force, and he saw law as the only alternative to war in a conflict-ridden world. Baldwin resigned as ACLU director in 1950. He died in 1981 after decades of activism in the causes of peace, justice, and human rights.

**Baruch, Bernard Mannes** (1870–1965) *financier, presidential adviser*

Presidential adviser and financier Bernard M. Baruch is best known as a proponent of cooperation between business and government. Born August 19, 1870, in Camden, South Carolina, he was the second of four sons of Isabelle Wolfe, the daughter of a plantation owner, and Simon Baruch, a medical doctor who served in the Confederate Army during the Civil War. In 1881, the family moved to New York City. After graduating from the College of the City of New York, Baruch pursued a career at a brokerage house and bought a seat on the New York Stock Exchange. At age 33, Baruch left the brokerage house to invest and quickly made his own fortune. He married Anne Griffen and had three children.

Baruch was active in Democratic Party politics and campaigned for WOODROW WILSON. Baruch became one of Wilson's most trusted advisers. During WORLD WAR I, Baruch accepted an appointment to the advisory commission of the Council on National Defense. In 1918, he became chair of the WAR INDUSTRIES BOARD. Once he joined the wartime government, Baruch sold his holdings and bought millions of dollars in Liberty Bonds to support the war effort. After the war, he accompanied President Wilson at the treaty negotiations at Versailles and framed the economic provisions of the treaty. Baruch also became an adviser to the Harding and Hoover administrations and joined the Brain Trust of Franklin D. Roosevelt's adminis-

tration. Some of the most innovative creations of the first New Deal, such as the Agricultural Adjustment Administration, were modeled on the private-public cooperation of Baruch's War Industries Board. Foresighted, Baruch anticipated the coming of the Second World War and advised Roosevelt to stockpile essential stores of rubber and tin. As special adviser for the defense effort, Baruch wrote the federal government's report on postwar reconversion of industry in 1943.

After World War II, Baruch continued to advocate United States involvement in the world. President Truman appointed him head of the United Nations Atomic Energy Commission, where Baruch advocated international control of atomic energy. He remained a presidential adviser to the end of his life, although his primary interest in the postwar period was philanthropy. He was a major contributor to Columbia University. He died on June 20, 1965.

## baseball

Baseball in its modern form took shape between the years 1900 and 1930. During this time, baseball became America's most popular sport because it appealed to Americans of all backgrounds and classes. Baseball supporters proclaimed that the baseball player was the model citizen, because as a team member he subordinated his self to the good of the team. As an individual, he had to make instant judgments on the field. During the time of mass emigration from abroad, proponents of baseball held it up as a tool for integrating all American citizens. At the same time, baseball offered the industrial nation a connection to its rural past. Due to its place in the American psyche, baseball gained widespread popularity, not only among spectators watching professional games, but also in the spread of baseball throughout American institutions and geography.

By 1890 professional baseball leagues had formed as a profit-driven business, in place of the amateur gentleman leagues that had defined the sport previously. The National League, the first formed, functioned as a cartel that controlled the expansion of teams into new cities through charters, the movement of players through the reserve clause, and by unofficially suppressing player salaries. Inserted in every player's contract, the reserve clause gave the team the exclusive rights to a player unless it traded him or sold him to another team. The National League faced a new challenge to its control around the turn of the century. In 1894, a rival league, the Western League, formed; and by 1901 it renamed itself the American League and claimed status as a major league. The two leagues settled in 1903

by establishing a national commission to rule major league baseball. The new league consisted of eight National League teams and four American League teams.

The decades after the settlement creating the National Commission saw the coming of age of professional baseball as an embodiment of the American character. Baseball emerged in this way for a variety of reasons. First, organized baseball undertook an effort to identify baseball as a uniquely American sport. In 1907, the league set up a commission to study the origins of baseball. Ignoring ample evidence that baseball derived from the British game of rounders, the commission found that Abner Doubleday had created baseball in 1839 in Cooperstown, New York. This history gave baseball its mythical standing as a uniquely American game. In addition to the owners' efforts, the players themselves provided the heroes who brought the public into the parks. Players in the Major Leagues came from every ethnic background, except African American. Fans could thus identify with players of their own ethnic background. The type of play on the field also led to an increase in popularity. In the first two decades of the 20th century, managers and players employed strategies that became known as scientific baseball. Scientific baseball revolved around strategies for scoring one run at a time. Home runs became scarce as hitters rarely took full swings. This new style of play became popular at a time when craft production was declining. At the ballpark, fans could go to a game and watch their favorite players plying their craft.

The game's new popularity was evident in the twofold increase in attendance between 1900 and 1910. The owners responded to the new crowds by building new stadiums. Between 1909 and 1923, 15 teams built new concrete and steel ball parks, which attested to the permanency of baseball as an American institution. These ballparks became civic monuments and symbols of a city's standing as a major metropolitan area. The parks also provided retreats from city life for city residents. For the price of a ticket, one could escape the dirt and noise of the city and enter a non-urban setting of green grass that made a connection to the rural past.

Baseball's popularity took a brief slide in the late 1910s as a result of World War I and the 1919 "Black Sox" scandal. Because they had suffered financially during the war, team owners suppressed player salaries after the war, when the major leaguers returned. In the 1919 World Series, eight Chicago White Sox players accepted bribes in return for purposely losing the series to the Cincinnati Reds. The ensuing scandal darkened baseball in the eyes of many of its fans. It also led to the creation of the office of commissioner of baseball, which replaced the old three-person commission that had ruled baseball since 1901. One of the first actions taken by the new commissioner, Judge Kenesaw Mountain Landis, was to ban the eight White Sox,

Babe Ruth (*Library of Congress*)

including the legendary player Shoeless Joe Jackson, from baseball for life.

The 1919 scandal caused only a momentary setback in the game's popularity. Its recovery was due to the play of one man, Babe Ruth. Ruth almost singlehandedly ended the scientific baseball era. In his second season as a full-time player, he hit more home runs than all other American League teams combined. Players throughout baseball quickly adapted Ruth's technique of taking a full swing, and run-scoring soared in the 1920s. In addition to his abilities on the field, Ruth became a larger-than-life figure who endorsed countless consumer products. Ruth, who grew up in a Baltimore orphanage and became the most recognizable figure in American sports, appealed to Americans because he represented what many Americans believed to be their own potential.

Americans did not satisfy their appetite for baseball solely as spectators of professional baseball. Baseball teams popped up throughout America. Towns, companies, colleges, military bases, naval ships, Indian schools, and prisons all had baseball teams. In addition, African Americans, who were not allowed on major league teams after 1890, formed their own teams and leagues. After the turn of the

century, women also began to form softball teams, both on college campuses and in town and industrial leagues. Baseball was the first sport to spread through college campuses. Employers established baseball teams. They hoped that participation in the healthy leisure activity of baseball would make workers content and less prone to striking. To stock their teams, companies often resorted to hiring workers solely for their baseball ability. Towns of any size also had their own teams. These teams were made up of local players who played teams from other nearby towns. They also often paid a player or two on their roster so that they could win. In fact, some major league baseball players played for local teams on their off days to earn extra money. By the 1910s, each military base in America had at least one team, and naval captains organized teams and were issued uniforms and equipment as part of their supplies.

The perceived and widely agreed upon beneficial effects of playing baseball led to its use by institutions like federal Indian schools and prisons. Reformers argued that baseball and team sports in general helped build character. The Indian schools aimed at turning their charges into Americans and hoped to use baseball as one of their tools. The rise of baseball coincided with changes in prison organization and baseball became a key component of the new prison reforms that had turned to rehabilitation.

Baseball reflected another part of the American character—racism. Major league baseball barred African Americans beginning in the 1890s. Company teams were segregated by race. African Americans played on some college teams, but those teams often had to cancel games because opponents refused to play against African-American players. African Americans formed their own town teams and semipro teams, and many companies formed teams segregated by race. In the 1920s, a group of African-American teams formed the Negro National League, consisting of six teams that played a league schedule and barnstormed to fill out their schedules. The Negro National League teetered on the brink of extinction throughout the 1920s because it relied on the poorest segment of American society for its attendance. It folded in the 1930s.

## Big Stick diplomacy

President THEODORE ROOSEVELT believed it would be necessary for the United States to use its military power to protect American interests, and in 1902 he told Congress that the United States needed to “speak softly and carry a big stick.” The president believed that the United States needed an activist foreign policy to serve as a “civilizing” influence for “backward” or “uncivilized” nations, namely: To preserve order and stability in the world, Anglo-Saxon industrial nations had to intervene in the affairs of nonwhite, Latin, or Slavic economically underdeveloped nations. A crucial element for Roosevelt in the new American expansionism was the development of U.S. sea power, which enabled the nation to exert its influence beyond its borders. Under his leadership, the American navy expanded to a size and strength that only Great Britain exceeded. Roosevelt, a “Rough Rider” who had led troops in Cuba in the Spanish-American War of 1898, symbolized the new expansionist role of the United States in the world.

Roosevelt's policies were best illustrated by relations between the United States and Latin America and the Caribbean. According to historian Walter LaFeber, the United States intervened in the Caribbean at least 20 times between 1898 and 1920. In the aftermath of the Spanish-American War, the United States took control of Cuba as a protectorate. In his annual message in 1898, President William McKinley insisted that the American military would control the island until a “stable government” was built. To ensure stability, Congress passed the Platt Amendment, which gave the United States the right to intervene on the island if the Cuban government failed to protect its own independence. The United States granted independence to Cuba only after the new government agreed to U.S. oversight in 1902. When a rebellion threatened the stability of the island in 1906, President Roosevelt sent troops to Cuba; and they stayed there for three years. Between 1912 and 1917, the United States sent Marines to occupy Cuba when American interests were threatened by social unrest.

American military dominance in the Western Hemisphere was symbolized dramatically by the U.S. occupation of the PANAMA CANAL zone. After the United States military backed a revolution in Colombian Panama in 1903, the new government granted the United States control over the canal zone for 100 years, with an option to renew. The Panama Canal opened in 1914; three years afterward Roosevelt proudly announced, “I took the Canal Zone and let Congress debate!”

In 1909 the administration of WILLIAM HOWARD TAFT sent troops to Nicaragua in support of revolutionaries who were on the verge of toppling the government. The troops seized the customs houses. When peace returned to Nicaragua, the Taft administration lobbied for American

A cartoon satirizing President Theodore Roosevelt's foreign policy motto of "Speak softly and carry a big stick." (Hulton/Archive)

bankers to provide substantial loans to the new government, which increased American economic influence over the country.

Under the administration of **WOODROW WILSON**, the United States set up a military government in the Dominican Republic in 1916 after the Dominicans rejected a treaty that would have made the country a protectorate of the United States. The United States had seized control of the finances of the Dominican Republic in 1905. American troops stayed in the Dominican Republic from 1916 to 1924. In addition, the Wilson administration sent marines to Haiti in 1915 to suppress a revolution. Americans wrote a new constitution for the country in 1918. United States troops remained in the country until 1934.

The Wilson administration meddled in affairs in Mexico as well. In 1910 Porfirio Díaz, a dictator friendly to American business interests, was overthrown, leading to a series of revolutions. In 1913 a reactionary general, Victoriano Huerta, overthrew the new regime. When Wilson became president in the United States, he refused to recognize Huerta's administration, which he considered a "government of butchers." In 1914 American forces seized the Mexican port of Veracruz. When the troops that Wilson

had ordered to land in Veracruz fought the Mexican army, 19 American soldiers died and 126 Mexicans were killed. In turn, the military presence of the United States helped the insurgents led by Venustiano Carranza. When the revolutionaries took over the government, Carranza rejected American proposals for a new government. In 1915, the Wilson administration backed Pancho Villa, who led the opposition to Carranza, but the American administration withdrew its support when it appeared that Villa was a losing cause. In 1915 Wilson gave preliminary recognition to the Carranza government.

In 1916, Villa retaliated by taking 16 Americans from a train in Mexico and shooting them. A few months later his troops crossed into the United States at Columbus, New Mexico, killing 17 Americans. Wilson responded by sending an expeditionary force into Mexico, in what became known as the **MEXICAN INVASION**, to track down Villa. Rather than finding Villa, the American troops fought with the Carranza army, in which engagements 40 Mexicans and 12 Americans died. On the verge of war, the Wilson administration withdrew the American troops from Mexico. After four years of futile efforts, the United States formally recognized the Carranza government.

The intervention of the United States in Mexico cost quite a few lives but produced few gains for American interests. However, the willingness of the United States to intervene in Latin America signified its increased power and influence in the Western Hemisphere in the early 20th century.

## birth control

The years between 1900 and 1930 saw the growth of a social movement to promote birth control. It addressed issues such as censorship laws, lack of public education and knowledge on sexual matters, the ban on the sale, distribution, and advertising of birth control devices such as the condom and diaphragm, and women's health. Under the banner of "voluntary motherhood," birth control advocates had, since the 19th century, advocated the use of abstinence or various folk methods of birth control, including calculating women's monthly cycle in the rhythm method and coitus interruptus, or early withdrawal, as the primary means to prevent pregnancy. They argued that limiting births improved the quality of marriage and family life, extended the time devoted to educating children, and allowed women to become better mothers.

At the turn of the century, a new generation of birth control advocates emerged on the scene. Influenced by European sexual theorists, such as HENRY HAVELOCK ELLIS, and the availability of the improved spring-loaded vaginal diaphragm, leaders such as MARGARET SANGER and anarchist EMMA GOLDMAN organized public rallies and campaigns. They sought to educate women about their options for limiting fertility. Arguing that a high birthrate both restricted women's lives and endangered their health, they sought to distribute new information and new means of birth control in their role as community nurses and organizers. The rates of death in childbirth and from illegal abortion and poor maternal health among the working classes presented radical birth control advocates with compelling reasons to make the means of limiting fertility generally available. In this radical phase of the birth control movement, limiting births was linked to the struggle against poverty. Sanger's first publication, embracing both class-based and feminist radicalism, was called *The Woman Rebel*. Being on the radical edge took its toll. With her sister, Ethel Byrne, Sanger

opened the first birth control clinic in the United States in Brooklyn, New York, in 1916. They provided advice to nearly 500 women before the police closed its doors 10 days after it opened. For her violation of the New York law forbidding distribution of birth control information, Sanger received a 30-day jail sentence. The decision of the court in her case, however, convinced her that the only way to obtain court endorsement for birth control was to rely on doctor-staffed clinics. In 1917, she founded the more moderate sounding *Birth Control Review* as a forum for her views and made connections with the medical community.

In contrast, feminist sex radicals saw doctors' control, traditional methods of abstinence, and male-controlled means of birth control like condoms as restrictions on women's freedom. Sexual emancipation would come from women's ability to control their own bodies and accept motherhood on a voluntary basis. Double standards of marital and nonmarital sexual behavior too often kept women from achieving individual sexual freedom, which many considered essential to women's equality. Mary Ware Dennett, Sanger's chief rival for the leadership of the birth control movement, founded her own Voluntary Parenthood League. Working for the repeal of federal laws on birth control, Dennett took exception to Sanger's new tendency to give doctors control over access to contraceptives.

A major obstacle to the distribution of birth control pamphlets and devices such as the diaphragm were the regulations prohibiting the circulation of lewd, obscene, or immoral materials through the U.S. mail. Under the Comstock Act of 1873 sex education radicals had been charged with obscenity for such minor infractions as advocating male abstinence. Sanger's *Woman Rebel* was refused mailing privileges, although it contained no specific information about birth control. With the 1914 publication of her pamphlet, *Family Limitation*, Sanger became the target of Comstock prosecution, and she fled the country. Others were arrested and brought to trial under the Comstock laws and local ordinances pertaining to public speeches and published tracts advocating fertility limitation and methods of contraception.

Some conservative groups supported the control of fertility for different reasons and with distinctly different methods. They argued that limiting the fertility of the poor would improve the general character of the population and openly advocated policies to cleanse the population of "degenerate" traits. They preferred medical sterilization to birth control methods. Sterilizing poor women who had too many children or family members who had serious physical or mental health problems (including signs of lower intelligence and the supposedly inherited trait of criminality) became accepted practice in some public hospitals and social work agencies. Linked together with the new science of EUGENICS, sterilization programs signaled the new

willingness of state and local governments to intervene in private lives, especially in PUBLIC HEALTH matters.

The medical profession played a role in distributing birth control and in research on fertility control. Socially conservative and jealous of their professional authority, many doctors opposed the social movement to limit births. Others argued that medical experts should control access to and treatment of patients using birth control. After her public trial, Sanger began to turn toward the medical profession as the only possible way to allow women access to birth control. She compromised on the democratic call for easily available means of birth control in public clinics and agreed, instead, to regulations that gave doctors the power to offer or restrict birth control to women patients. Doctors also began to conduct their own research, and in 1925, Dr. Robert Litou Dickinson founded the Committee on Maternal Health to further fertility research.

The use of contraception increased over the decades of the birth control movement. Women simply had greater access to birth control devices through a proliferating number of organizations and clinics. In 1917, Sanger helped to organize the National Birth Control League, which became the American Birth Control League in 1921. The league established more than 50 clinics in 23 cities by the end of the decade. Access, however, depended on income and region. In a 1925 study, more than 80 percent of middle-class married women, aged 25 to 29, used contraception; only 36 percent of poorer women did. Sanger's Birth Control League became the Planned Parenthood Federation of America in 1942. Under that name, it continued to expand its services until, in 1961, it became an international organization under the name Planned Parenthood–World Population.

### ***Birth of a Nation, The***

*Birth of a Nation* was among the first full-length feature films produced in the United States. The movie, released in 1915, was longer and more expensive than any of its American predecessors. Prior to *Birth's* release, few producers had attempted films of such breadth and depth. American movies were typically short and inexpensive productions. Most were viewed as novelties. Few actually tried to convey stories of substance. In contrast to other early productions, *The Birth of a Nation* attempted not only to tell a story but also to convey feelings and emotions. Civil War and Reconstruction, were epic subjects, but DAVID WARK

GRIFFITH did more than try to tell a story of the war and its aftermath. He tried to bring out the nationalist feelings of his day.

The movie was more expensive to produce than anything that had come before it. The screenplay, which was only a fraction of the overall expense, cost Griffith \$2,500 and 25 percent of the profit. The total cost of production was estimated at approximately \$110,000, five times more than had been spent on any previous film. Having run out of money and investors, Griffith borrowed all that he could to bring the production to market. The undertaking was truly monumental compared to other projects of the time. There were six weeks of rehearsals. The shooting that began in July stretched into October. Editing alone took three months in contrast to the six weeks it took for a typical production.

Griffith's gamble paid off. The movie was a tremendously lucrative undertaking. It is estimated that in the first six months of its national run, *The Birth of a Nation* drew more people than the performances of all the stage plays in the United States during any five-year period. In the United States the movie ran for 44 consecutive weeks. It grossed an estimated \$50 million. Not all of its viewers, however, gave the movie glowing reviews. Audiences in a number of cities were so appalled by its content that they rioted.

The movie was primarily based on Thomas Dixon's book and play, *The Clansman*. Griffith also borrowed from Dixon's *The Leopard's Spots* and a number of other sources. Dixon's racist works, and the movie that followed, offered a slanted perspective on the Civil War, heavily colored by Griffith's own Southern point of view. The film vilified Northerners and blacks. It portrayed Reconstruction as an attempt by Northerners to punish the South by forcing black rule upon it. It idealized the KU KLUX KLAN. It portrayed the Klan as a just and necessary organization instrumental in saving not only the South but also the chastity and sanctity of Southern women. The movie was based on Dixon's favorite premise, that blacks are naturally inferior and that expecting them to govern themselves was cruel and inhumane.

Even before the film was released, Griffith was not oblivious to the controversy that the movie would likely create. Aware of the possible reaction, he cut some of the more offensive scenes from the movie. He removed one scene denouncing the hypocrisy of New England abolitionists, who were portrayed as the descendants of slave traders. He also omitted reference to a letter from Abraham Lincoln to Secretary of War Stanton about Lincoln's belief that blacks were inferior to white people. These compromises proved to be inadequate. Controversy followed the movie.

Controversy was so acute that the film was brought before the United States Senate. The possibility of official action prompted Thomas Dixon to send a cable to James

E. Marine, the Democratic senator from New Jersey, warning against the dangers of censorship. Griffith himself was appalled by the response the film provoked. To challenge his critics, he wrote a pamphlet entitled, "The Rise and Fall of Free Speech in America." He defended both the movie and his right to produce movies that were not always popular in all settings.

*Birth of a Nation* was the first of two great epics produced by Griffith. His next epic stemmed from the criticisms leveled at *Birth*. The movie was called *Intolerance*. Griffith believed that his critics, not he, were intolerant of ideas. He used the movie as a weapon to attack those who were critical of his work. It was based on the premise that things that are good and pure are rarely tolerated. For him, *Birth of a Nation* exemplified something that was good yet soiled by intolerance. To finance *Intolerance*, Griffith spent all of his profits from *Birth of a Nation* and was forced to buy out all of its backers. Unfortunately, *Intolerance* was not a success. With the decline of liberalism, the movie, which championed brotherly love as the solution to many of the world's problems, fell out of fashion. Desperate to recoup his losses, Griffith broke the four-hour-long movie into two shorter films.

*Birth of a Nation* was a grand achievement in cinema. Not only was it broad in scale and scope, but it also conveyed passion and emotion. However, its message was far less spectacular. It offered a distorted view of history. Whether he knew it or not, Griffith's movie did more than redefine the way movies were made; it displayed the effect that movies could have on the culture.

### Blatch, Harriot Eaton Stanton (1856–1940)

suffragist

One of the most important suffragists of her generation, Harriot Stanton was born in 1856, the daughter of Elizabeth Cady Stanton, the mother of the women's rights movement in the United States, and Henry B. Stanton, an abolitionist. Harriot Stanton attended Vassar College, where she eventually earned a master's degree in 1894. Throughout her life, Harriot remained close to her mother, whom she aided in the writing of *History of Woman Suffrage*.

In 1882, Harriot Stanton married Harry Blatch, a British citizen, and moved to Britain, where she became active in the suffrage campaign. It was there that Blatch witnessed the militant tactics of British suffrage activists and interacted with prominent British socialists. By the turn of

the century, Harriot was dividing her time between Britain and the United States. She returned to the United States full-time in 1902, when she began campaigning for WOMAN SUFFRAGE in New York State. New York was both symbolically and politically important for Blatch and other suffragists. The movement, however, appeared to be stalling under the leadership of the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION.

Harriot Blatch injected new momentum into the state and national campaigns for female suffrage. As an activist with the NATIONAL WOMEN'S TRADE UNION LEAGUE, she had gained some experience with working-class women. In 1907, she cofounded the Equality League of Self-Supporting Women, an organization dedicated to recruiting working-class women's support for suffrage. The Equality League changed its name to the Women's Political Union and later merged with the Congressional Union, which became the NATIONAL WOMAN'S PARTY in 1916. In addition to broadening the support base for female suffrage, Blatch employed dramatic tactics borrowed from British suffragists. Mass marches, including one down Fifth Avenue, as well as a trolley-car campaign through New York's towns and cities, helped publicize female suffrage and catapult it onto the national political agenda.

When her husband died in 1915, Blatch returned to Britain. She came back to the United States in 1917 and worked for the Food Administration. After the war and the successful suffrage campaign, Blatch remained active in the women's and socialist movements. As an activist with the National Woman's Party, she worked for a federal equal rights amendment. Throughout her career, Blatch wrote several books, including *Mobilizing Woman Power* (1920) and *A Woman's Point of View, Some Roads to Peace* (1920). She died in Connecticut in 1940.

Harriot Stanton Blatch's greatest contributions revolved around her intellectual and tactical innovations for the female suffrage campaigns. Adopting radical methods and broadening the class base of the movement helped raise political awareness among women themselves and among the nation's political elite, eventually leading to the passage of the Nineteenth Amendment for woman suffrage. In addition, her intellectual work on the history of the women's movement, such as the 1922 volume she published with her brother, *Elizabeth Cady Stanton, as Revealed in Her Letters, Diary and Reminiscences*, set the stage for future women's historians not only to investigate women's history but also to trace women's historiography.

## blues

The origins of the musical genre of the blues are not well-documented, but its roots can be traced back to the African continent. Much of its foundation is in 16th-century African music. But while its roots can be traced back to Africa, the blues is not an African form of music. Its African origins were augmented by work and gospel songs, folk music, minstrel shows, and other musical forms. These influences combined to create what became a uniquely American style of music. In addition to its musical origins, there were other forces that helped to mold what is now considered the blues from its origins in the post-Civil War South.

Rural blues developed remarkably different identities in different regions. The blues that developed in the southern coastal states differed greatly from the style that developed in Texas. The blues that developed in Texas was very different from that of the Mississippi Delta. Each region had its own flavor. The southern coastal blues was noted most for its steady rhythm and clear enunciation. Blind Boy Fuller was one of the many blues singers who came to represent this unique form of entertainment. Texas blues was characterized by single-string picked arpeggios—not the strummed chords that characterized the blues of other regions. Blind Lemon Jefferson came to symbolize the Texas blues musician. The blues that developed in Mississippi became the most influential of the three forms. The slide, or bottleneck, guitar came to symbolize this blues style. Charley Patton was the earliest blues man to bring the blues style out of the Delta.

WORLD WAR I and the accompanying GREAT MIGRATION transformed the blues. These events caused tremendous demographic shifts that allowed the blues as a musical form to spread to other parts of the country. The rural undertones of the blues artists were adapted by men and women with urban experiences. They revolutionized not only the blues but also American music and culture. Atlanta, St. Louis, Memphis, Detroit, and Chicago all proved to be fertile soil for the growth and development of urban blues. Chicago was by far the most important city in the development of urban blues, and it became synonymous with them. Chicago blues stands apart from other forms in its emotional structure. Paramount Records in Chicago began producing blues recordings in the late 1920s. With a gigantic mail-order business in the South, Paramount was successful in promoting and distributing Chicago blues until it succumbed to the economic hardships of the Great Depression. Even after Paramount had closed its doors, blues musicians continued to develop music in Chicago.

The effect that the blues has had on the development of American music is incalculable. The rhythms, beats, and lyrical styling of blues spread across America and to the rest of the world. The influence that the blues has had on jazz, soul, and rhythm-and-blues is clear. Less evident, but

equally true, is the effect that the blues had on rock and roll, rap, and other popular forms of entertainment. It was truly an American art form.

**Boas, Franz Uri** (1858–1942) *anthropologist, linguist, museum curator*

Anthropologist Franz Boas played a significant role in redefining race in America. He did this by moving the discussion of race away from Social Darwinism and toward an emphasis on individual cultures. By emphasizing the importance of each culture's values, Boas convinced many in the scientific community and in America in general that racial differences were due not to hereditary differences but to culture. Through his pathbreaking studies of culture, Boas revolutionized the field of anthropology.

Born in 1858 in Germany, Franz Boas received his doctorate from the University of Kiel in 1881. On a scientific expedition to an island off the coast of Canada, he became interested in the local natives' culture. It sparked his lifelong dedication to the field of anthropology. Boas undertook his first anthropological work in 1886, a study of the Native Americans living in the Pacific Northwest. He later served as the curator of ethnology at the American Museum of Natural History in New York City and in 1899 became Columbia University's first professor of anthropology.

It was in his role as professor of anthropology that Boas created modern anthropology. In the late 19th century, anthropologists rarely made in-depth studies of other cultures, relying instead on theories as to why some cultures differed from European culture. Boas introduced scientific study to the field. He taught his students, among them MARGARET MEAD, Ruth Benedict, and Zora Neale Hurston, to apply scientific rigor and emphasized methodology. He popularized field studies as the chief investigation tool of anthropology. By actually living among the subjects of his studies, Boas came to the conclusion that every culture was dynamic and could change over time, if subjected to new conditions. In his 1911 *Mind of Primitive Man*, Boas deflated the belief that non-Western societies represented a primitive or earlier stage of civilization. The fact that all cultures were not equal meant only that all cultures had not experienced identical historical conditions, Boas argued. Because he believed in the equal worth of all cultures, he attacked social scientists' practice of ranking races based

on the perceived superiority of northern European culture. He taught his students and other social scientists to evaluate cultures on their own merits, not to compare other cultures with their own.

Boas applied his findings on cultural differences to critique the prevailing racial attitudes in the United States. His dedication to altering America's views on race arose from a strong liberalism and his commitment to scientific accuracy and purity. Boas stridently argued that people of African ancestry were not naturally inferior to Caucasian people as most white Americans believed. Differences in achievement between the races in the United States could be explained by studying cultural differences and the historical circumstances in which cultures had developed. Boas sought to counteract the prejudices against African Americans by studying and popularizing accounts of the great African civilizations of the past to show that at one time Africans had created greater civilizations than Europeans. African Americans such as ALAIN LOCKE and W. E. B. DUBOIS were influenced by Boas's findings and used them in their struggle for equal rights. The work of Boas and his students helped undermine the grip of scientific racism on American culture and fundamentally altered ideas about race.

### Boxer Rebellion (1900)

A popular movement in China that tried to expel foreign powers, the Boxer Rebellion played a key role in the U.S. establishment of the OPEN DOOR POLICY in China. The Boxers were members of a secret organization in China known as the Society of Righteous and Harmonious Fists, which Westerners nicknamed "shadow boxers," because they practiced martial arts. The Boxers opposed European influence in China. Beginning in the mid-19th century, European powers began to force their way into China. Under a series of treaties, Germany, Great Britain, France, and Russia had gained special economic rights. In these treaties, the Europeans gained benefits such as lower import taxes and the right to build railroads and construct telegraph lines. In return, they helped the Qing dynasty, ruler of China, in its struggles against Chinese who wanted to overthrow their imperial government. All of these treaties were unequal with regard to the rights granted to the Europeans and the benefits gained by China. The Chinese imperial rulers granted economic rights to European

countries because the imperial government was weak relative to Europe. The Europeans living in China were not, moreover, subject to Chinese law. The European countries sent missionaries with them who traveled the country seeking converts, which led many Chinese to resent their activities.

The Chinese who took part in the Boxer Rebellion were reacting to the expansion of European influence in rural China. As European economic concerns moved away from the coastal areas, they caused economic problems for the rural Chinese. European steamship companies, for example, put local bargemen out of business. Railroads brought European businesses that undersold local craftsmen. Christianity also posed a threat to the Chinese traditional way of life. Chinese Christians no longer took part in communal celebrations that worshipped ancestors. In the eyes of some Chinese, this made Christians a threat to communal unity. Christianity and the missionaries who spread it were also suspect because they were closely tied to the European colonial powers. They became, therefore, another symbol of the inferior position that China occupied.

The Boxer Rebellion began in the rural areas of northern China. The Boxers were emboldened by their belief that bullets could not hurt them and that they could summon troops of spirit warriors to fight on their side. They targeted any one or thing that symbolized foreign rule. Thousands spread across the countryside, burning churches and killing Chinese Christians. They also tore up railroad tracks and telegraph lines. Initially, the Boxers fought for the expulsion of foreigners and the overthrow of the Qing dynasty. After the imperial government gave support to the Boxers, they changed their goal to expelling foreigners and supporting the Qing dynasty. The support of the imperial government made it possible for the Boxers to attack the foreign residents in the cities. In June 1900, Boxers besieged the foreign quarters in Beijing and Tianjin. They held 600 foreigners, including future president Herbert Hoover, and 4,000 Chinese Christians in the coastal city of Tianjin. In the capital city, Beijing, the rebels blockaded 900 Europeans and Americans in the diplomatic quarter.

The European countries sent an international force to end the sieges and rescue the Europeans. On June 14, 1900, they successfully ended the siege in Tianjin, and on August 14 they regained control of Beijing. By the end of 1900, there were 45,000 foreign troops in northern China. These troops initiated raids against the Boxers and defeated them.

The Boxer Rebellion had significant consequences for Chinese relations with the West. An agreement signed by China's Imperial government and 11 Western powers called for a number of penalties and concessions. For the first time, foreign troops were stationed in Beijing. In addition,

the Western countries secured the right to build a series of forts in a line from the coast to Beijing, which would protect their supply and communication lines to the capital city. The agreement also required the Chinese government to pay a large fine. Aside from these consequences, the Boxer Rebellion led the Western powers to change their strategies in dealing with China. Before the rebellion, many Europeans had begun to favor transforming their spheres of influence into formal colonies. The antiforeign Boxer Rebellion led them to change their minds. It convinced them that they would face tremendous opposition from the Chinese if they attempted to expand their control. The United States played an important role in these developments. In 1900, the United States called for an open door policy in China that would give equal opportunity for trade to all nations. The European countries agreed to the U.S. proposal, and the Open Door Policy came to define the relationship between China and the Western powers.

**Brandeis, Louis Dembitz** (1856–1941) *associate justice of the Supreme Court*

One of the most important lawyers and jurists of the Progressive Era, Louis Brandeis is best known for his work on extending the protection of the law to women workers with his brief in *MULLER V. OREGON*, and for his service on the U.S. SUPREME COURT. His tenure on the Court began in an age of judicial formalism and ended with the acceptance of expanded federal authority over regulation under the New Deal. Brandeis was born in 1856 in Louisville, Kentucky, the son of a wealthy grain merchant. He completed secondary education in Dresden, Germany, and returned to the United States at age 18 to study law at Harvard University. He graduated in 1877 and practiced law in Boston until 1916. In 1891, Brandeis married Alice Goldmark, the daughter of a wealthy Boston family. The couple had two daughters.

Brandeis began to pursue a career in law that earned him the name “the people’s attorney.” He worked to secure protective labor laws, block business monopolies, and secure benefits to workers. During this time, he defended small or minority interests against the majority, and he became a prophet of regulation with his books, *Other People’s Money* (1914) and *Business: A Profession* (1914). In them, Brandeis supported workers and trade union rights. He also advocated regulation in support of small firms

Louis Brandeis (Library of Congress)

and as a means for maintaining democratic competition in the market. In 1912 he supported WOODROW WILSON’s campaign for the presidency as one of the authors of Wilson’s New Democracy campaign. Four years later, Wilson appointed Brandeis to the U.S. Supreme Court as an associate justice. He was the first American Jew to be appointed to the high court.

Brandeis’s career was directed toward the preservation of individual rights and freedoms and opposition to “bigness” in business as a threat to individual liberty. In this respect, Brandeis straddled the positions of a liberalism that saw the need for legal protections and yet sought to restrain the growth of government. As he once wrote, “Experience should teach us to be most on our guard to protect liberty when the government’s purposes are beneficent. Men born to freedom are naturally alert to repel invasion of their liberty by evil-minded rulers. The greatest danger to liberty lurks in insidious encroachment by men of zeal, well-meaning but without understanding.”

Once on the Court, Brandeis became an ally of OLIVER WENDELL HOLMES in defining civil liberties, and especially First Amendment rights, in a series of landmark dissents from majority Court opinion. The body of this work hinged on the idea that democracy required the individual right to free speech as a necessary ingredient for social change. Without the free circulation of ideas, democracy could not hope to thrive. One of his major court opinions,

## 42 Brownsville Riot

*Whitney v. California*, engaged Brandeis in defining the role of ideas, education, and government in society.

Brandeis served on the Supreme Court from 1916 to 1939. In his later years, he became a leading court ally of Roosevelt's New Deal initiatives but also opposed such legislation as the National Recovery Act. In the end, however, Brandeis helped build support for the Court revolution of the 1930s. He resigned from the Supreme Court in 1939 and died on October 5, 1941, in Washington, D.C.

### Brownsville Riot (1906)

A glaring example of racial prejudice and military injustice, the Brownsville Riot resulted in the unwarranted dismissal of 167 African-American soldiers. The riot occurred on the night of August 13, 1906, but the tensions that led to the attack had built since the troops had arrived two weeks earlier. At the core of the conflict was the opposition of the Brownsville, Texas, townspeople to the stationing of African-American troops at Fort Brown. The immediate cause was the claim made by a white woman on the night of August 12 that she had been assaulted by one of the African-American soldiers. Tensions were so high that on the night of August 13, the commander of the fort issued a curfew order requiring all soldiers to return to the fort. Later that night, soldiers were awakened by gunfire coming from outside the fort. By the time they could muster, the shooting was over. In the aftermath of the shooting, it was discovered that one man had been killed in the town.

The townspeople immediately claimed that the soldiers in the fort had rampaged through the town, shooting into houses and businesses, and murdering a man. The army convened a commission of officers and townspeople to investigate the incident. It quickly concluded that the African-American soldiers had done all the shooting. The commission was unable, however, to say which of the soldiers had been guilty. In fact, the commission ignored evidence that the soldiers had not been guilty of the attack. Accepting the commission's report as fact, President THEODORE ROOSEVELT sought to force the innocent soldiers to turn in the guilty ones. To do so, Roosevelt threatened all three companies of soldiers with dismissal if the guilty ones were not found. None of the soldiers ever came forward. Seeing it as a conspiracy by the soldiers to cover for the guilty ones, Roosevelt dishonorably discharged 167 men and barred them from government service for life.

If not for the efforts of Senator Joseph Foraker of Ohio, the incident probably would have ended there. After reading the transcripts of the commission's hearings, Foraker

came to the conclusion that the evidence used to convict the soldiers was flimsy and unreliable. Foraker pressured the Senate into holding hearings into the dismissal. In these hearings, it became clear that many of the eyewitnesses who claimed to have seen the African-American soldiers shooting could not have, due to the darkness and their distance from the events. Other evidence used against the soldiers was also disproved. Nonetheless, the Senate voted to uphold the dismissal. The soldiers had their last chance when a Military Court of Inquiry convened in 1909. The court eventually ruled to reinstate 14 of the soldiers who had been dismissed. They never did indicate why those 14 were being reinstated while the other 153 remained discharged. In 1971, after reading John Weaver's book, *The Brownsville Raid*, Representative Augustus Hawkins of California introduced a bill calling for the reinstatement of the men dishonorably discharged. The next year, the Department of Defense recognized the miscarriage of justice by granting honorable discharges to the soldiers.

### Buck's Stove (1906)

A Supreme Court decision supporting the use of labor injunctions, *Buck's Stove* was one of a series of legal cases in the Progressive Era that worked to restrain the political actions of the labor movement. After the turn of the century, the rising tide of labor militancy had provoked a strong, coordinated response from business and financial interests. They demonstrated their antipathy toward labor and collective bargaining in an array of strategies from employer associations like the NATIONAL ASSOCIATION OF MANUFACTURERS and the American Anti-Boycott Association to strikebreaking with help from local police or state militia. Another tool was to appeal to the judiciary's known conservatism. Using the Sherman Antitrust Act of 1890, large corporations and small businesses alike sought court injunctions against strikes and boycotts as illegal restraint of trade. Courts had enjoined labor unions from carrying on community-level boycotts throughout the late 19th century, but they had not interfered with "We Don't Patronize" lists in union publications. The heightened conflict between capital and labor allowed for little room to bargain. In two separate court cases—*Loewe v. Lawlor* (known as DANBURY HATTERS) and *Buck's Stove*—the U.S. Supreme Court sided with businesses that sought relief, first as com-

compensation for financial losses during a boycott and secondly when a national labor organization refused to obey a court injunction.

The *Buck's Stove* case arose when the Iron Molders International Union struck Buck's Stove and Range in St. Louis. In the face of the company's refusal to bargain, the Iron Molders union declared a boycott. As part of the boycott, the AMERICAN FEDERATION OF LABOR (AFL) placed the firm on the "We Don't Patronize List" in its journal, the *American Federationist*. In 1907, the firm's owner, who belonged to an antiunion organization, asked the federal courts to issue an injunction against the AFL, citing its use of the boycott list as an unfair restraint of interstate commerce and a violation of the Sherman Act. The courts found in the firm's favor and ordered the AFL to remove Buck's Stove from the list. Rejecting the court's injunction as a violation of the rights to free speech and a free press, AFL president Samuel Gompers refused. The lower courts held that there was no right to free speech if it involved criminal activity. The federal district court found Gompers and his associates, AFL secretary Frank Morrison and UNITED MINE WORKERS OF AMERICA president JOHN MITCHELL, guilty of violating the Sherman Act and charged them with contempt of court. They fined the union leaders and sentenced them to jail terms. In the appeal, Gompers lost his case before the Supreme Court. By that time, however, the statute of limitations for contempt of court had run out. The Iron Molders Union and the company also had settled the strike. In response, the Supreme Court stayed the lower court sentencing. While union leaders were not forced to pay the fines or endure prison, the *Buck's Stove* case, like *Loewe v. Lawlor*, prompted new caution from union officers in how they used scarce time and resources. Costly court cases, whether fighting injunctions, antitrust suits, or violations of free speech, exhausted the labor movement financially and politically. At the same time, the widespread use of labor injunctions based on antitrust law inspired the AFL to return to the political arena. In the elections of 1908 and 1912, labor mobilized its members to vote for the parties and candidates that would address the mounting list of labor's grievances.

### ***Buck v. Bell* (1927)**

In 1927 the SUPREME COURT of the United States reviewed and upheld as constitutional a Virginia state law allowing for the compulsory sterilization of feeble-minded and defective persons. Carrie Buck, a Virginia teenager, was declared feeble-minded, despite the fact that she was a good student

and intellectually at par with her classmates; she also was to be sterilized under the Virginia law. Virginia's law and the Supreme Court decisions to uphold it were influenced by the EUGENICS movement, which promoted social controls to improve hereditary qualities and to regulate genetic deficiencies in human beings.

Carrie Buck's mother, Emma, a widow who lived at the margins of society in Charlottesville, Virginia, was deemed feeble-minded due to her "shiftless and immoral" lifestyle and placed in the Colony for Epileptics and Feeble-minded for life. Unable to care for Carrie after the death of her husband, Emma gave her into the care of the Dobbs family. Carrie became their house servant. Although she was doing well in school, the Dobbses withdrew her, so she could do more service for the family and also be lent to other families for chores. In 1923 Carrie became pregnant. Despite Carrie's claim that she had been raped by a family nephew, Mr. Dobbs, afraid of the shame Carrie's situation would bring to his family, filed commitment papers and claimed that Carrie was feeble-minded. Because of her pregnancy and her mother's feeble-minded status, Carrie became a prime target for sterilization by the Virginia Commission on Feeble-mindedness.

After giving birth to her child, Vivian, Carrie was quickly condemned to the Colony for Epileptics and Feeble-minded. There she was to be sterilized to promote the welfare of society. To build a case that Carrie's genetic stock was defective, her seven-month-old daughter was examined and deemed "not quite normal." Harry Laughlin of the Eugenics Record Office and Carnegie Institution, without ever meeting or examining Carrie, gave a deposition declaring Carrie Buck a mental defective and socially unfit. Although the evidence against her was weak, the U.S. Supreme Court upheld the institutionalization and sterilization of Carrie Buck.

The Court's decision was written by OLIVER WENDELL HOLMES, a Progressive justice and a supporter of eugenics. Holmes argued that the feeble-minded sapped the strength of the state and that compulsory sterilization would prevent society from being "swamped with incompetence." Furthermore, he argued that "Three generations of imbeciles are enough." Justice Pierce Butler, a conservative on the Supreme Court, was the only dissenter. The Supreme Court's affirmation of the Virginia sterilization law in *Buck v. Bell* allowed for the passing of similar laws in 30 states. Some 50,000 people were sterilized without their consent as a result of those laws. *Buck v. Bell* became a legal model for the Nazis during the Holocaust when 350,000 people were sterilized. *Buck v. Bell* was never directly overturned. In *Skinner v. the State of Oklahoma* (1942), the Supreme Court found that the state could not sentence criminals to compulsory sterilization, because the categories by which sterilization was imposed were "invidious discrimination"

## 44 Budget and Accounting Act

that undermined equal protection under the law. Eugenic sterilization declined in the aftermath of World War II.

### Budget and Accounting Act (1921)

The Budget and Accounting Act of 1921 was one of the most significant legislative enactments of the early 20th century. It provided guidelines for the modern budget and a framework for funding an activist state. The act required the president to submit a single, consolidated budget proposal to the Congress each year. It also established the Bureau of the Budget to provide the president with the resources necessary to produce a budget proposal and the General Accounting Office to give Congress the resources to ensure accountability. The Budget Act did more than coordinate the budget. It gave the president greater influence over how federal monies were allocated through the formulation of budget figures and priorities.

The movement toward a budget system in which the executive branch had greater control over federal spending had been building for years. It had its roots in the PROGRESSIVISM of the early 20th century. Progressive reformers sought to rationalize government through the elimination of corruptible interests and political machines. To stem the power of the political machines and challenge government corruption, especially on the municipal level, reformers placed more trust and authority in executive and administrative institutions. In doing so, they promoted the accumulation of power at the executive level.

A number of studies attempted to rationalize the budgetary process, including one conducted by President WILLIAM HOWARD TAFT's Commission on Economy and Efficiency (1910–12). Still, the call for reform of the budgetary process did not stop with investigations. Supported by members of both parties, the creation of a regular budgetary process was a plank for the Republican presidential campaign in 1916 and 1920 and the Democratic campaign in 1920. In 1919, hearings were held in both the House and Senate to research possible changes in budgetary procedure. The legislation made it through both houses of Congress, but President WOODROW WILSON vetoed it because of concern with the constitutionality of the bill. The next president, WARREN G. HARDING, signed the Budget Act in 1921. CHARLES GATES DAWES, who had been in charge of procurement for the American

army during WORLD WAR I, took over as the first budget director in that year. Dawes instituted several reforms in how government agencies kept records and accounted for revenue and expenditures. The Budget Act did more than rationalize the budgetary process. It established the foundation for the modern budget and the expansion of presidential power in the 20th century. In doing so, it helped to coordinate the modern state.

### Burke Act (1906)

The Burke Act of 1906, passed by Congress as an amendment to the Dawes Severalty Act of 1887, continued the federal policy of assimilation of Native Americans into white society. The policy of forced assimilation, which began with the Dawes Act, was a reversal of almost 50 years of policies regarding Native Americans. Previously, the federal government had forced indigenous peoples to relocate onto reservations in the United States.

Attempting to assimilate Native Americans, the Bureau of Indian Affairs tried to eliminate the tribal ownership of land and allot plots of land to individual owners. The Dawes Act allotted 160 acres to heads of families and 80 acres to single adults. Congress passed the Burke Act to hasten the transition to individual ownership by eliminating the 25-year trust period required under the Dawes Act. Under the trust system, individuals who were allotted land could not acquire full title to the property for 25 years. The Burke Act amended the allotment law to give the secretary of the interior the power to issue fee-simple titles, which were fees without restrictions on the transfer of ownership. The amendment removed all restrictions on the sale, taxation, and claims on property.

The assimilation policies at the turn of the century had undermined indigenous cultures in two ways. First, Indian children were removed from their families and sent to white-run boarding schools. Second, the policies prevented Indian religious rituals from taking place, and replaced them with Christian ones. But the government ultimately abandoned its assimilation policies, because the white administration of the allotment program was corrupt and inept. However, Native Americans lost much of their land in the process. Native Americans continued to resist assimilation into white society despite government efforts. Attempting to transform traditional, tribal societies into individualist, agrarian ones, Congress had hoped to hasten the forced assimilation of Native Americans with the Burke Act.

—Glen Bessemer

## business

One of the most far-reaching achievements of the turn-of-the-century United States was the rise of modern business. The reorganization of business transformed virtually every aspect of American life. Due to new forms of organization, American firms became larger and more profitable than anything that had come before them. Their growth led to fundamental changes in the American political and social structure. Americans simultaneously embraced and challenged the encroachment of capitalist enterprises in industry, finance, and transportation.

The concept of incorporation was key to the success of American business. Corporations had several distinct advantages over other forms of organization. The most basic advantage was the ability to pool small quantities of wealth from a large number of people. This allowed corporations to amass wealth that had previously been unimaginable. In addition, corporations offered investors protection against excessive liability. Unlike other forms of partnership, corporations were protected by the doctrine of limited liability. A shareholder in a corporation was committed only to the share invested in the enterprise, and individual investors could not be sued for additional damages. Incorporation made industries of scale not only possible, but also practical. Another advantage of the corporation was its perpetual life. Businesses organized around a mortal person would often fall into disarray when the person passed away. With a corporation, the shares owned by the recently deceased could easily be transferred to one's heirs. Such a transfer would have little if any impact on the life of the corporation. The corporation became so commonplace that the Supreme Court of the United States argued that it had all of the rights and responsibilities of the individual. It was an important legal and social distinction.

The modern corporation relied on new forms of structure and organization. The emergence of both vertical and horizontal methods of integration was crucial to the formation of large international businesses. Vertical integration is based on the practice of developing a corporate structure dedicated to obtaining control of supply, production, and distribution lines. Andrew Carnegie's Carnegie Steel, which later became U.S. Steel, was extremely adept in the art of vertical integration. Through a number of well-planned acquisitions, Carnegie gained control over virtually every

thing from the raw materials that were needed to produce his steel, to the marketing and distribution of the finished products. Horizontal integration, however, was even more prevalent in the emerging business climate of the late 19th century. It reflected business's pursuit of market monopoly. JOHN D. ROCKEFELLER'S STANDARD OIL was especially efficient when it came to horizontal integration. His acquisitions of competitors created such a monopoly that by the turn of the century Standard Oil controlled more than 90 percent of the oil refined in the United States. Carnegie and Rockefeller may have been two of the most successful integrators of their time, but they were by no means the only ones to use these forms of consolidation. Dozens of companies used one form of integration or the other.

The assembly line was another innovation that made the emergence of businesses of scale possible. Meat packer Gustavus Swift not only benefited from the use of vertical and horizontal integration, he also utilized the assembly line that HENRY FORD later perfected. Swift's assembly line was actually more like a disassembly line. He used the mechanized line to slaughter, pack, and ship animals. The development of what became known as "the American System" was crucial in the full utilization of the assembly line process's flexibility and efficiency. Once interchangeable parts were incorporated into the assembly line process, the factory began to replace the artisan's shop. Not long after, skilled workers themselves were either replaced by assembly line workers or incorporated into the process.

In order to manage these large new organizations, new levels of managerial bureaucracy were formed. The deskilling of industrial workers created a need for a new managerial class. No longer would apprentices and skilled workers control the means of production. Professional managers came to replace foremen, skilled workers, and small shop owners in supervising labor. In an ongoing attempt to increase efficiency, managers sought to regulate all facets of the production process. Others practically relegated human workers to the status of machines. FREDERICK WINSLOW TAYLOR provided the intellectual foundation for these attempts at removing human inefficiencies from the production process. He developed and promoted the concept of SCIENTIFIC MANAGEMENT. Taylor's *The Principles of Scientific Management* outlined his concept of scientific management. Each task was broken down into its most basic components. Each worker was gauged on his or her ability to complete the basic tasks using the most efficient methods in a prescribed time. Taylor also argued for higher wages and a more rational means of compensating workers. Businesses throughout the country paid homage to Taylor's theories; but for the most part, they were unable to integrate his ideas into their organizational structure. They also resisted paying workers more. These theories did, however,

fundamentally alter the way in which both business and labor were perceived.

Equally important to the development of modern businesses were new forms of internal communication. Carbon paper, the typewriter, and the adding machine were only a few of the devices that helped coordinate the internal activities of the increasingly large corporate structures. Without these aids to communication, it would have been virtually impossible for management to effectively organize businesses of scale and scope. New technologies allowed corporations to become bigger and more powerful. Alongside many of the traditional businesses grew other industries that supported business. Insurance, banking, and finance fostered and were fostered by new corporate giants.

New sales and marketing practices were other important factors that allowed for the expansion of American business in the 20th century. Without efficient modes of delivery and distribution, American corporations would have had relatively primitive means for marketing their wares. By the 20th century, the United States went from being a fragmented market, characterized by low volumes, restricted markets, and high prices, to a unified one, characterized by high volumes, a national market, and lower prices. This transformation altered not only the way that manufactures and commodities were marketed and distributed, but also had a profound impact on the life of the average American. New consumer goods made their way into urban and even rural homes. Montgomery Ward, Sears and Roebuck, and other distributors further advanced marketing in the United States by providing national mail order houses for rural customers. Products increasingly became less expensive and more readily available. As products became more readily available, ADVERTISING developed to market them to the growing consumer base. By the middle of the 1920s, the typical American had attained a standard of living that would have been incomprehensible just a half-century before.

Average Americans commercially benefited from the emergence of big business, but they did not all benefit in the same way. The managerial class and new corporate elite received the greatest benefits; as a result, American corporate leaders gained unprecedented power and influence. The ways in which a number of corporations used their influence caused a great deal of alarm. No form of business caused more concern than America's first really large business enterprise—the railroads. A number of politicians and writers voiced their concerns about the negative influence of the railroad. Perhaps no one was more successful in defining the cruelty of the omnipresent railroad than Frank Norris. His novel *The Octopus* (1901) defined the struggle

between a ruthless, all-powerful, malevolent railroad and traditional American life. According to Norris's portrayal, the Octopus, which was a metaphor for the Southern Pacific Railroad, not only destroyed the economic well-being of the typical American community, it would also eventually destroy the moral fiber of the nation if left unchecked. Norris was only one of a generation of authors and journalists, known as MUCKRAKERS, who attacked the emerging political and economic power and control of corporations.

As progressive reformers, muckraking journalists and politicians helped to usher in a political movement to limit the power of the corporation. The public reception of UPTON SINCLAIR's *The Jungle* is an example of this development. While Sinclair's book was a thinly veiled call for a socialist society, it was not received as one. Americans responded to Sinclair's novel by calling for corporate regulation. It led to the passage of the PURE FOOD AND DRUG ACT of 1906. Like the adoption of the Food and Drug Act, the Progressive movement called for new regulations to minimize the negative aspects of business without challenging its supremacy. The Sherman Antitrust Act and the CLAYTON ANTITRUST ACT were other attempts that symbolized the Progressive mission. Under trust-busting efforts such as the Northern Securities case (1904), Progressive Presidents ROOSEVELT and TAFT sought to control "bad" trusts, while assisting the development of "good" trusts. In the end, the laws only united the already feeble labor movement of the era.

Regardless of how Americans perceived the rise of business, corporations and corporate power were expanding greatly by the turn of the 20th century. Businesses grew not only in size and in scope, but also became more diverse and powerful. Modern corporations changed the way in which people worked, shopped, and lived. The growth of the American economy allowed for increases in discretionary income and challenged the ways in which people had lived for generations. Business, more than any other force, revolutionized American society.

### **Cable Act** (1922)

The Married Women's Independent Citizenship Act (also known as the Cable Act) granted female residents (either native-born or immigrant) who married men of a different nationality the right to U.S. citizenship either by retaining their premarital citizenship or, in the case of foreign-born women, of applying for naturalization separately. Such repatriation restored to women resident in the United States their rights as citizens; female citizens who married foreign nationals and lived abroad continued to be subject to expatriation, or loss of their American citizenship and its rights.

A natural extension of the concerns of the women's rights' movement, the Cable Act was the first step toward establishing equal nationality rights for women. Proponents of the measure included members of the Women's Joint Congressional Committee, the League of Women Voters, and the NATIONAL WOMAN'S PARTY. They argued that the EXPATRIATION ACT of 1907, which, for the first time, expatriated women who married immigrant aliens, threatened women's independent citizenship. It denied native-born women the same rights as men to marry whom they chose; it reinforced men's rights to grant citizenship to their spouses and children, while denying American women the same rights; and it allowed for the deportation of women who married non-citizens and, during WORLD WAR I, even subjected them to the loss of property, if their husbands were enemy aliens. Challenging the idea of women's dependent nationality, women's advocates endorsed the legislation authored by Representative John Cable of Ohio that gave back to women the rights of equal citizenship, even as it denied other women the same consideration. As the editors of the *Christian Science Monitor* proclaimed, the Cable Act had "freed a legion of women from an archaic law which took no cognizance of political and moral progress." At the same time, the Cable Act also retracted the right of automatic naturalization to immigrant women who

married American men. Racial bars instituted under other immigration legislation had double force in excluding foreign-born women from naturalized citizenship.

While women's organizations championed the law, the Cable Act was shaped as well by campaigns to restrict immigration, which culminated in such laws as the IMMIGRATION ACT OF 1917 (or Alien Exclusion Act) and the NATIONAL ORIGINS ACT of 1924. Anti-immigration sentiment expressed in the DILLINGHAM COMMISSION's reports (1911) and in an executive branch committee on naturalization (1906) sought to restrict access to the rights of citizenship. While foreign-born women who married American men previously were eligible for the benefits and rights of citizenship by the act of marriage, native-born women who gave up their rights to marry the citizen of another country were thought devoid of moral standing. In an era of strident patriotism and Americanization efforts, many thought that women who married foreign nationals should be penalized by losing their citizenship rights. These attitudes, however, were to change. Proponents of women's independent citizenship argued that women deserved the same citizenship rights and privileges as men. Fears of the new immigration also contributed to the change in law. The ratification of the Nineteenth Amendment giving women the right to vote transformed the pro-forma naturalization of foreign-born wives into political privilege. Agitation for married women's independent citizenship, which culminated in the Cable Act, took from immigrant wives these protections. Advocates of immigration restriction argued further that foreign-born women married to American citizens should no longer be eligible for special rights or considerations and had to meet the same requirements for immigration and naturalization as men, a process made more severe by the new immigration quotas.

**Cannon, Joseph Gurney** (1836–1926) *Speaker of the House*

At the turn of the century, Joseph “Uncle Joe” Cannon was one of the most powerful and influential politicians in the country. He served as the Speaker of the House of Representatives from 1903 until 1911 and exerted almost total control over the chamber. Born in 1836 in New Garden, North Carolina, Cannon attended the Cincinnati Law School and became a member of the Indiana bar in 1858 at the age of 22. A year later, Cannon moved to Illinois and became actively involved in politics. He was elected to the House of Representatives in 1872.

A conservative Republican, Cannon established a reputation as a fiercely partisan politician. As one of the leaders of the “Old Guard” Republicans, he staunchly opposed attempts by Populists and Progressives to enact legislation aimed at limiting the power of corporations or expanding the oversight role of the federal government. Cannon became Speaker of the House in 1903 and utilized arcane congressional rules to control House committees with an iron fist. He steadfastly opposed progressive reformers in both the DEMOCRATIC and REPUBLICAN parties, including THEODORE ROOSEVELT and WOODROW WILSON, and frequently used his power over House committees to block new legislation. Exercising the Speaker’s control over the Rules Committee, Cannon controlled the House in this manner between 1903 and 1910.

Cannon’s authoritarian leadership led to an important split in the Republican Party that contributed to its loss of the presidency in 1912. Party progressives were frustrated by Cannon’s ability to delay or block reform legislation. Under Roosevelt’s leadership, important reforms such as the HEPBURN ACT (1906), the PURE FOOD AND DRUG ACT (1906), and the MEAT INSPECTION ACT (1906) were enacted, but many other reforms were defeated. Shortly after his election in 1909, progressives in the party approached President WILLIAM HOWARD TAFT about weakening Cannon’s power. Taft rebuffed these overtures and began developing close ties with Cannon and the Old Guard. Frustrated by Taft’s refusal to oppose Cannon, a group of moderate and progressive Republicans led by New York reformer George W. Norris joined ranks with Democrats to limit the power of the Speaker. They shifted the power to appoint members to the Rules Committee from the Speaker of the House to the House as a whole. Cannon’s defeat was followed by another stinging rebuke when in 1912, after serving nearly 30 years in Congress, he failed to win reelection to his congressional seat. The split in the Republican vote in 1912

Joseph Cannon (*Library of Congress*)

brought Democrat Woodrow Wilson to the White House. Republican progressives eventually returned to the party, and Cannon was reelected in 1914. Cannon served another six terms until his retirement in 1923, but he never again wielded the same political clout.

**Capper-Volstead Act** (1922)

In response to worsening conditions in the rural economy, Congress passed the Capper-Volstead Act in 1922 to aid agricultural cooperatives. The agricultural depression that followed WORLD WAR I had a devastating impact on American farmers. As farm prices dropped, farm organizations once again sought relief from the economic crisis. For some farmers, nothing short of government price supports for farm commodities would do. Others wanted Congress

to maintain and even raise tariffs on agricultural goods. For the American Farm Bureau and its congressional allies, however, the surest way to protect American agriculture was to protect the growing number of farm cooperatives against the power of corporate agribusiness. Specifically, the Farm Bureau wanted to exempt farm cooperatives from the Sherman Antitrust Act of 1890. Agricultural corporations had used the Sherman Act as the legal basis for court challenges to agricultural cooperatives.

In Congress, the politicians who supported farm relief and liberal agricultural subsidies came to be known as the Farm Bloc. Organized by lobbyist Gray Silver of the American Farm Bureau, the Farm Bloc was made up of 25 senators and 100 representatives pledged to aid American farmers. It included such Republican progressives as Senators HIRAM WARREN JOHNSON of California, George Norris of Nebraska, and Arthur Capper of Kansas. Seeking to bolster the farm economy, the Farm Bloc developed legislation to address the problems in agriculture. There was no clear majority for government price supports to return agricultural commodities to parity, or, more specifically, the prices that matched the 1914 economy. Instead, the Bloc opted for more modest means of improving the farmers' lot. They were able to find common ground under the administration of WARREN G. HARDING and worked with the Department of Agriculture on a legislative agenda.

The first result of the Farm Bloc's efforts was the Capper-Volstead Act. According to Senator Arthur Capper, the bill was designed "to give to the farmer the same right to bargain collectively that is already enjoyed by corporations." A solid majority of Congress passed the bill, which exempted farm cooperatives from antitrust laws in order to cooperatively produce, market, handle, and price their products. Earlier, Congress granted general antitrust protection to farm cooperatives and labor unions in the CLAYTON ANTITRUST ACT of 1914. Because the law remained vague, however, the Clayton Act was no more effective in protecting farm cooperatives from antitrust suits than it had been in protecting unions from labor injunctions. The Capper-Volstead Act specifically empowered farm cooperatives by clarifying the activities covered by the antitrust exemption and extending the protection from antitrust laws to a broad class of agricultural cooperatives. While it fell short in addressing the farm crisis, the Capper-Volstead Act signaled the sustained power of farmers' political interests and organizations at a time when the nation was becoming increasingly urban and industrial. It serves today as the major legal protection for agricultural cooperatives from antitrust prosecutions.

### Carnegie Endowment for International Peace

The Carnegie Endowment for International Peace was one of a group of conservative peace organizations that lobbied the government to abide by international law and build collective security as a way to keep peace and world order. Considered "political internationalists," conservative peace groups included bankers, lawyers, politicians, and academics as their members. The Carnegie Endowment was the largest of these peace organizations. The president of Columbia University, Nicholas Murray Butler, headed the organization, and James T. Shotwell, a Columbia University professor, served as director of the Endowment's Division of Economics and History. Because the Carnegie Endowment included many important leaders in government, business, and higher education, it had a significant influence on disarmament policies in the United States and Europe.

One example of the close links the endowment had to elites in government was when a former law partner of Secretary of State Kellogg left the endowment to serve as assistant secretary of state. In addition, the Carnegie Endowment funded other internationalist organizations such as the League of Nations Non-Partisan Association (LNNPA) and the Foreign Policy Association (FPA). In addition, conservative peace groups with close ties to elites such as the Carnegie Endowment, the League of Nations Non-Partisan Association, and the National Committee on the Cause and Cure of War (NCCCCW), worked for American participation in the World Court.

Overall, the Carnegie Endowment for International Peace preferred the indirect lobbying of political leaders and other elites to the direct pressure tactics used by more radical peace groups. In 1927, to use one important example, Shotwell visited the French foreign minister Aristide Briand to lobby for the United States and France to formally outlaw war. In the end, Briand utilized many of Shotwell's suggestions when he sent a draft of a treaty to Washington on June 20, 1927. When Secretary of State Frank Kellogg hesitated in responding to the Briand proposal, peace groups pressured him to accept the French pact.

Liberal peace organizations such as the National Council for the Prevention of War (NCPW) and the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM (WILPF) agreed with more conservative groups about the need for a World Court and for the United States to join the League of Nations. They disagreed politically, however, about militarism and disarmament. Liberal peace groups

pushed more actively for disarmament and encouraged reductions in naval appropriations. Meanwhile, the conservative groups such as the Carnegie Endowment advocated U.S. participation in the World Court, but they were less strident about naval disarmament.

The debate over the proposals of Kellogg and Briand illustrated the influence that the Carnegie Endowment for International Peace had on the foreign policies of the United States and the European countries. In the end, many liberal and conservative peace leaders cooperated to promote Briand's draft treaty in Washington. But when Secretary Kellogg proposed an alternative multilateral treaty in the place of Briand's bilateral treaty, the Carnegie Endowment eventually supported it, although reluctantly. The KELLOGG-BRIAND TREATY, which formally outlawed war, was signed by 62 nations in 1928.

**Catt, Carrie Lane Chapman** (1859–1947) *suffragist, feminist, peace activist*

Carrie Lane Chapman Catt, a noted woman suffragist, was born in Wisconsin in 1859. After working her way through school and teaching school, she became superintendent of schools in Mason City, Iowa. After the death of her first husband, Leo Chapman, she joined the Iowa Woman Suffrage Association, eventually becoming the organization's state organizer. In 1890, Carrie Chapman married George Catt, who encouraged her to pursue her suffrage activism.

In 1900, Catt assumed the leadership of the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION (NAWSA). Under her first tenure, which lasted until 1904, she strengthened the national structure, the treasury, and the administration of the organization. In 1904, with her husband dying, she resigned to care for him. After his death, Catt worked on the suffrage campaign in New York State. Catt's suffrage activism was not only a reflection of her ideological commitment to the cause, but also the result of her relationships with progressive men, one of whom, George, willed her enough money to live on while she continued to work on the suffrage issue.

In 1915, NAWSA was in organizational shambles under Anna Howard Shaw's direction. Armed with money that a woman had willed to the cause, Catt returned to lead NAWSA with her own staff. She demanded that the organization become more centralized and hierarchical under her command. Charismatic and well-organized, Catt gained the loyalty of suffrage activists from around the country. As head of NAWSA, Catt proposed her "Winning Plan," which

proposed to gain passage of a federal WOMAN SUFFRAGE amendment within six years in conjunction with state campaigns. The plan called for state suffrage associations to lobby their federal representatives to pass and their state legislators to ratify the amendment. It also used the national office to pressure the Democratic and Republican parties to include a suffrage statement in their platforms and keep the suffrage issue alive through publicity campaigns. Even though publicity was the cornerstone of NAWSA's methods, anti-suffragists regularly derided the activists. NAWSA represented the more moderate wing of the suffrage movement, a fact that contributed to its success. In stark contrast to the more radical NATIONAL WOMAN'S PARTY, NAWSA appeared genteel and more acceptable to the men in power, a key constituency that NAWSA was trying to reach.

The breakthrough for Catt and NAWSA came in New York in 1917, when women won the right to vote at the state level. The victory in the East reenergized the struggle at the national level. The House passed the federal suffrage amendment in 1918, but the Senate voted it down, causing Catt to mobilize again. The Senate finally passed the woman suffrage amendment in 1919. In August 1920, the Nineteenth Amendment giving women the right to vote was ratified by 36 states.

Although suffrage certainly preoccupied Catt, she participated in other reform efforts during the suffrage fight. She was active in the Woman's Peace Party, which attempted to pressure the belligerent countries to come to the negotiating table during WORLD WAR I. Somewhat ironically, Catt also served on the Women's Committee of National Defense, a government agency that coordinated women's voluntary work.

After the ratification of the Nineteenth Amendment, Catt founded the League of Women Voters and served as its honorary president through the rest of her life. She remained active in peace activism as well. Catt died in 1947 in New Rochelle, New York. Undeniably, Catt's political skills and tenacity, along with the efforts of the foot soldiers of NAWSA and other groups, contributed to the success of the suffrage campaigns at the federal and state levels.

**child labor**

Throughout U.S. history children have worked. In pre-industrial America, children worked on family farms, as

craft apprentices, and in a variety of other jobs. As large-scale manufacturing increasingly came to characterize the economy, several economic, social, and cultural changes led to the abolition and mitigation of some types of child labor. Child labor was not, however, completely abolished.

According to published statistics 18 percent of children aged 10 to 15 were employed in 1900. These figures undoubtedly understate the number of children working. Children played an important role in America's economy. They could be found working in almost any area of the economy. In the textile industry, for example, 25 percent of the workers were below the age of 15 and the ratio of children to adult workers was the highest of any industry in the United States. In the textile mills, children worked as spinners, constantly walking up and down between the spinning machines, brushing lint from the frames, watching the bobbins for breaks, and making repairs to the threads. The hot humid air that kept the thread from breaking necessitated keeping the windows closed. The atmosphere

became filled with lint that the children breathed all day long. Children worked 10 to 12 hour days in such conditions and for low wages.

Children also worked long hours in America's coal mines. Children officially went to work in bituminous coal mines at the age of 12, began work as coal-breakers at age 14, and went underground at 16. These were the legally established ages, but a great many children went to work at earlier ages because enforcement of the laws was lax. Coal-breakers sorted through the coal after it was mined, leaning over the loads of coal, breathing in coal dust all day long. Underground, the children were subject to all the dangers that made coal mining one of the most dangerous occupations. In fact, children suffered accidents at a rate three times that of adults.

Many other child laborers faced similar dangers working in the seafood canning industry, vegetable and fruit canning, the glass industry, and as newsboys, peddlers, and bootblacks. In the seafood canning industry, children

Young boys selling newspapers (*Library of Congress*)

as young as five years old helped shuck oysters and peel shrimp. They suffered cuts from the oyster shells and knives. In vegetable and fruit canning, children sometimes worked 80 or 90 hours per week, because the product was perishable and needed to be canned quickly. In addition, the canning industry was not regulated in any state until 1920, because it was classified as agricultural. In the glass industry, child workers were forced to stand or crouch all day, often next to a furnace heated to 2,500 degrees. Cuts and burns were common, in addition to the dangers posed by the atmosphere filled with fumes and dust. Newsboys have taken on a mythical status in American culture as little businessmen. In reality, they worked long hours in a job that exposed them to the dangers of city streets and could be financially ruinous. The newsboys bought all the papers, so the cost of any that remained unsold at the end of the day came out of their pockets.

A number of factors combined in the early 20th century to abolish or regulate child labor. Some of these factors emerged from the reform movements of the Progressive Era while others were due to changes in the economy and technology. During this time, a new conception of childhood developed. Many reformers feared that the tremendous increases in industrialization, immigration, and urbanization threatened the future of America. Concurrently, they believed that America's children were the future of the nation and needed to be saved from the evils of industrialization.

The reformers pushed through a variety of state laws making education compulsory up to a certain age and restricting the work of children less than 16 years of age in some industries. The coverage of these laws was inconsistent. In 1912, for example, only nine states had laws prohibiting the employment of children under the age of 14 in factories, under 16 in mines, and required the eight-hour workday for children aged 14 to 16. Twenty-two states still permitted children less than 14 years old to work in factories. Thirty allowed boys under 16 years to work in mines, and 31 states permitted children under 16 years of age to work more than eight hours a day. Moreover, many laws were not enforced. In 1912, for example, 23 of the states that had age restrictions for employment required no documented proof of age.

The weakness and inconsistency of the state laws was principally due to opposition on the part of employers and working families. Many working-class families needed the paychecks of their children to survive. They would lie about their children's ages in order to get them into work. Most of the opposition came, however, from employers who claimed that child labor was good and necessary. These opponents, who were most active in states with industries dependent on child labor, resorted to a variety of arguments in opposing the laws. Working children were a blessing for work-

ing families in reducing poverty. By working at an early age, opponents of child labor laws argued, children gained valuable skills that they would use later in their work lives. Schooling was a waste for working-class children, because they could learn all they would ever need to know on the job. Child labor laws restricted the child's inherent right to work. Opponents of the child labor laws also argued that child labor was a necessity. Workers over the age of 16 were slow, clumsy, or just too big to accomplish some tasks. It took the nimble fingers of a child to accomplish some tasks. Many industrialists claimed that the very existence of many industries depended on child labor. If child labor were outlawed, manufacturers argued, they would not be able to remain competitive in the world economy and might be forced to move to another state that did not have stringent child labor laws.

The poor enforcement of state child labor laws led reformers to seek a federal child labor law. The first federal child labor bill was introduced in 1906. It sought to impose penalties for transporting across state lines goods produced by children less than 14 years of age. The bill was defeated in the House of Representatives. Opposition to the bill came from two sources. First, lawmakers repeated the arguments listed above. Second, there were congressmen who argued that it was an unlawful extension of the federal government's powers.

Child labor opponents did not rest, and by the mid-1910s, public opinion in most of the country was behind a federal child labor law. In 1915, a bill was introduced in the Congress that would, if passed, outlaw the transport of goods produced by child labor. The bill easily passed the House but never made it to a vote in the Senate, due to the opposition of southern senators whose states relied on child labor. In 1916, opponents of child labor tried again by introducing the KEATING-OWEN ACT, which easily passed both houses of Congress and became law on September 1, 1917. The law banned the employment of children under 14 in factories, workshops, and canneries, and children under 16 in mines and quarries. It also prohibited children under 16 from working more than eight hours a day and between the hours of 7 P.M. and 7 A.M. Numerically, the law barely affected child labor. It freed 150,000 children from work in mines and factories, but 1,850,000 still toiled at home, in fields, and on the streets. Proponents of the new law hoped, however, that it would serve as an example for states to pass their own child labor laws.

The role as a model for local efforts is about all the Keating-Owen Act was ever to accomplish because the Supreme Court ruled it unconstitutional in 1918 in *Hammer v. Dagenhart*. The case was concocted by the executive committee of the Southern Cotton Manufacturers. A circuit court judge ruled the Keating-Owen Act unconstitutional and granted a permanent injunction against enforcing the

law. The Supreme Court ruled, on appeal, that the act was an unwarranted exercise of the federal government's powers and an invasion of states' rights.

Child labor law advocates were again successful in passing federal child labor law legislation in 1918, but the Supreme Court ruled the law unconstitutional in 1922. The final effort at banning child labor came in the 1922 campaign to pass a constitutional amendment outlawing child labor. The amendment passed both the House and the Senate, but it failed to win the required two-thirds majority of the states. It was to be the last effort to federally legislate child labor prior to the 1930s.

Despite the failure of federal child labor laws, the number of children working did decrease during the 1910s and 1920s. Some industries that relied on child workers made technological innovations that replaced child workers with machines. Many states passed or strengthened their child labor laws. In 1904, for example, 17 states set some sort of limit on work by children under 14, and by 1929 all states set some limits and 29 outlawed entirely. In 1904 two states had outlawed children under 16 working more than eight hours a day. By 1929, 36 states had such laws. Thus, the battle against child labor had succeeded to an extent, but it was not until the economic collapse of the Great Depression and the post-World War II affluence that economic considerations minimized the role that child labor plays in the United States economy.

## Children's Bureau

Created by a 1912 act of Congress, the United States Children's Bureau was charged "to investigate and report . . . upon all matters pertaining to the welfare of children and child life among all classes of our people." The Children's Bureau emerged from concerns of the early 20th century over the health and welfare of America's children. Social reformers feared that future generations were endangered because many children were forced to work at an early age, lived in unsanitary conditions, did not receive an education, and were malnourished. Led by LILLIAN WALD, founder of Henry Street Settlement House in New York City, and FLORENCE KELLEY, head of the National Consumer League, a group of reformers developed the idea of a federal agency that would promote the health and welfare of children. Lillian Wald recounted how, after reading about a government official investigating the damage done by the boll weevil, she wondered why the U.S. government

could not have a "bureau to look after the Nation's crop of children?" She and other reformers believed that a federal agency was necessary, because the welfare of children was a nationwide concern and a federal agency could collect data on child welfare throughout the country.

Wald, Kelley, and other reformers undertook a nationwide campaign to mobilize public opinion for the Children's Bureau. In 1909 their cause was boosted significantly when President THEODORE ROOSEVELT came out in support of the idea. Between 1906 and 1912, however, 11 bills failed to make it through Congress, largely due to reservations about expanding the powers of federal government. The challenge of the PROGRESSIVE PARTY at the polls in 1912 compelled lawmakers to pass some progressive measures. The campaign finally succeeded with the passage of the act creating the Children's Bureau in 1912. President WILLIAM HOWARD TAFT signed the bill into law on April 9, 1912. Congress granted the first appropriation of \$25,640 later that year. The Children's Bureau was originally in the Department of Commerce and Labor. It was transferred to the newly created Department of Labor in 1913. Julia Lathrop became the first woman to head a federal bureau when she was confirmed by the Senate as chief of the Children's Bureau.

Initially the bureau did not have any administrative power. Its purpose was to research issues that affected children. Among the issues initially suggested for investigation were infant mortality, the birth rate, juvenile delinquency, orphanages, child labor, diseases of children, and sanitation. The Children's Bureau's first big project was to attack the infant mortality problem. It did this by studying the problem and publishing advice pamphlets. The bureau distributed 30,000 copies in six months of its first pamphlet, *Prenatal Care*. Between 1914 and 1921, it distributed nearly a million and a half copies of its second pamphlet on prenatal and infant care. In addition to its efforts with the public, the Children's Bureau also lobbied lawmakers on behalf of issues pertaining to children.

The Children's Bureau assumed new responsibilities in 1921 with the passage of the Maternity and Infancy Act. Popularly known as the SHEPPARD-TOWNER ACT, this act authorized the federal government to allocate \$1,200,000 each year to the states to promote health service for children, infants, and pregnant women. The Children's Bureau was made the administrator of these funds. This position established the bureau as the liaison between the states and the federal government, which increased its power over child welfare policy nationwide. Although state organizations were not under any legal control of the Children's Bureau, they acted as its subsidiaries because of its preeminence in the field of child welfare policy. The Children's Bureau's position allowed it to shape the chartering of child welfare programs in the states, including MOTHERS'

PENSIONS. The leaders of the Children's Bureau favored public child welfare agencies over private. Women such as Julia Lathrop believed that social reform needed to be professionalized, and she used her position as head of the Children's Bureau to support state agencies that employed professional methods of SOCIAL WORK. Her power came from her control of the Sheppard-Towner funds.

The Children's Bureau's role diminished in the late 1920s due to fighting between it and the Public Health Service, another federal agency concerned with health and welfare issues. Congress allowed the Maternity and Infancy Act to lapse in 1929 and transferred the health and medical functions of the Children's Bureau to the Public Health Service. The Children's Bureau remained a strong advocate for children after 1930, but it never again enjoyed the power that it had in the 1920s.

## cities and urban life

During the early decades of the 20th century, cities came to dominate the economic, social, and cultural landscape of the United States. For the first time, in 1920, more Americans lived in urban places than rural. By 1930, 56.3 percent of Americans lived in urban places. These numbers do not, however, tell the complete story of the city's place in America. The industrial expansion of the U.S. economy took place in its cities. The cities became the site for America's cultural development and the symbol of America's progress as a great power. To migrants from rural America and abroad, the city was a beacon that offered opportunities unavailable in the communities from which they migrated. These and a variety of other factors led the explosion of cities into the mainstream of American thought and life.

The first indication of the rising importance of cities during this period was the increase in urban population. In 1900, 39.7 percent of Americans lived in urban places. By 1930, 56.3 percent of Americans called a city home. From 1900 to 1930, the U.S. population increased 61.6 percent while the urban population increased 128.8 percent. In 1900 there were 38 cities with populations over 100,000. By 1930 there were more than 75.

This explosion in population came from several sources. First, the United States experienced a rise in the birth rate and a decline in the death rate. Thus, some of the population growth in cities was due to natural increase in the population. Most of the population growth came, however, from migrating individuals. Rural birth rates were increas-

ing at a time when the demand for farm labor was falling. Mechanization decreased the need for farm workers, and economically tough times for farmers led to a decrease in the number of farms. Many young rural Americans chose therefore to migrate to the cities. New city residents also came from the migration of African Americans from the South, especially during the GREAT MIGRATION. An unprecedented number of foreign immigrants also sought their fortunes in American cities. Between 1900 and 1920, an estimated 8,778,000 immigrants came to America to stay. The vast majority of them remained in America's cities.

The people flocked to the cities primarily because of the job opportunities. The American economy underwent incredible change at the end of the 19th century as a wave of consolidation altered American industry. Driving this consolidation was the rise of the business corporation. Corporations brought a managerial and organizational revolution to American industry that allowed a tremendous increase in the size of manufacturing plants. Huge factories employing thousands of workers became common in cities all over America. The General Electric plant in Schenectady, New York, employed 15,000 workers in 1910. The Pullman Car Company, International Harvester, Goodyear Tire and Rubber, and U.S. Steel all employed over 15,000 workers at their main plants by the middle of the 1910s. The Ford Motor Company also employed 15,000 workers by the mid-teens, and by 1924 it employed 68,000 workers at its new River Rouge plant in Dearborn.

The exploding population required cities to expand. In an unprecedented building boom, houses, apartment buildings, factories, stores, and office buildings all sprang up. Skyscrapers reached ever-greater heights and came to define the city. Cities also expanded outward by annexing neighboring towns.

As cities expanded, several factors combined to reshape their spatial arrangements. Some of these factors encouraged movement to the outer fringes of a city, while others concentrated activity in the city center. Technological and social factors helped spur the move by some residents out of the city center. Before transportation improvements made expansion possible, city residents lived in mixed neighborhoods that included residents of all classes. Most neighborhoods formed around a common ethnicity. As the size of the factories located in the center city grew, and the number of new immigrants from southern and eastern Europe increased, many wealthy and middle-class residents wanted to escape from the center city. The move of individuals to the outer fringes of the city was made possible by the development of transportation technologies, namely the electric streetcar and the automobile. The spatial arrangement of people and businesses had always been determined by the time it took a person to get to work. During the period before the creation of URBAN TRANSPORTATION systems,

American cities were packed around the core, because residents had to walk to all activities. By the mid-19th century, horse-drawn streetcars appeared, making it possible for residents to live outside the city center. In the late 19th century, the invention of electric streetcars revolutionized urban transportation. The new streetcars were capable of traveling at much greater speeds, which made it possible for city residents to live farther away from their jobs than in the past. Electric streetcars caught on quickly, and by 1902, 97 percent of urban transit mileage had been electrified.

City growth contributed to the social differentiation and separation among city residents. The streetcars made it possible for the wealthy and middle class to move out of the city center while the working class stayed. This rearrangement of people altered the social landscape of cities as residents sorted themselves out based on economic class and race, instead of ethnicity. The wealthy and middle class followed the streetcar lines and settled in the outer sections or in suburbs. The working-class residents were left behind where they lived in the older housing stock that had been abandoned by the wealthy.

Social differentiation also took the form of segregating African Americans into urban ghettos. Before World War I, African Americans lived in small enclaves in America's cities. As African Americans migrated to the cities in large numbers during the Great Migration, they pressed against the established racial boundaries, which often led to a violent backlash from white city residents. Opposition forced the now larger African-American population to live in the same area as the smaller group had previously. The African-American sections of cities became the most densely crowded sections, as residents were forced to divide and redivide apartments and older homes to make living spaces. These ghettos were some of the most expensive places to live, because landlords knew that the African Americans had no other place to go due to segregation.

At the same time that many city residents were moving out of the city center, a building boom was taking place in the city center as American industry sought to centralize financial, industrial, commercial, government, and entertainment functions. The skyscraper became the visible symbol of this centralization. Made possible by new technologies, the skyscraper offered building developers a way to counter the high cost of land in central business districts and helped businesses operate more efficiently by placing all the necessary inputs closely together.

This physical expansion, both up and out, required improvements in public services. New roads had to be built and old roads paved, streetcar lines extended, electric and telephone lines strung, and sanitation facilities built. Because these were seen as essential for cities' health, they were done either by the cities or by private companies regulated by the city. City services were not, however, always

New York City street crowded with pedestrians (Hulton/Archive)

equally distributed. Politically well-connected developers could, for example, convince city governments to extend water service to a neighborhood they were developing, aiding in the development of such a neighborhood.

The physical expansion of cities altered human relationships within them. In the older, more compact cities, residents interacted on a face-to-face level. The modern city became characterized by more impersonal relationships, due to the sheer size of the cities and the number of people with whom an individual interacted daily. This impersonal nature led many Americans to see the cities as dangerous places. Authors such as Theodore Dreiser wrote best-selling novels in which young female migrants came to the city and fell victim to its dangers. In these stories, unsavory men who sought to exploit innocent young females for immoral purposes lured their victims into a life of sin. To counter the perceived evil nature of the city, concerned social reform organizations such as the YOUNG MEN'S CHRISTIAN ASSOCIATION (YMCA) AND YOUNG WOMEN'S CHRISTIAN ASSOCIATION (YWCA), founded programs and institutions to help young city residents find their way.

At the same time that many Americans viewed the city as dangerous, the city also took center place in American culture. Young migrants were attracted to the options for POPULAR CULTURE and RECREATION in the city. The electrification of the city streets opened new public spaces by making it safe to venture out at night. A vibrant nightlife emerged from which residents could choose an ever-increasing variety of activities ranging from attending motion pictures to going to an amusement park. The cities also drove cultural change. The mass population in the cities provided a market for entertainment, making it profitable for producers. Jazz musicians, for example, relied on the African-American populations in northern cities to buy their recordings and attend their shows.

The power that cities exerted over all parts of American society made America an urban country both in its demographics and its culture. Whether one celebrated them or feared them, the city became the center of American economic, cultural, and social life during the urban explosion of the early 20th century.

## citizenship

*Citizenship* has a range of meanings in American political culture. It can signify an individual's legal and political standing or his or her national origin or allegiance; refer to practices regarding civic duty and political participation; specify eligibility for the benefits or responsibilities of citizens; or denote a sense of belonging and formal membership in a community. In its early history, citizenship in the United States was largely determined by state, not national, laws. State legislatures wrote the laws delineating the economic and social rights of citizens and established the rules for voting and political participation. The Fourteenth and Fifteenth Amendments changed that by asserting national rights in their provisions for equal protection, due process, and African-American suffrage. Still, the practice of citizenship was governed less by rules than by informal customs and practices until the 20th century.

For most of the nation's history, native-born white men had broad legal rights of property and contract and almost

universal access to the ballot. Women and minority and immigrant men, in contrast, had fewer political and economic rights and almost no political standing. While the privileges and responsibilities of citizenship expanded in the first three decades of the 20th century to include not only legal and political rights but access to social entitlements, women and minority men gained access to these rights only as a result of persistent political agitation and protest. For immigrant men and women, however, the history of citizenship over the same 30 years was especially volatile. IMMIGRATION had been largely unrestricted, with the exception of the Chinese Exclusion Act, passed in 1882. With the establishment of the Immigration Restriction League in 1894, however, campaigns to reduce immigration and narrow the grounds for citizenship met with growing success. New immigration laws, such as the ANARCHIST IMMIGRATION ACT (1903), and the IMMIGRATION ACT OF 1917 changed the rules about who was allowed to enter the United States. Asian immigration was formally barred; alien radicals were subject to deportation, and the Immigration Act of 1917 created a literacy test for those wishing to relocate in the United States. Efforts to redirect and reduce immigration culminated in the passage of the 1921 QUOTA ACT and the 1924 NATIONAL ORIGINS ACT, which severely restricted the number of immigrants from southern and eastern Europe and reinforced older bans on Asian immigration. Along with the tightening of regulations for immigration, there were changes in naturalization laws and more rigorous scrutiny when resident aliens applied for citizenship.

Political citizenship in terms of the right to vote was fairly informal and open to white men of most communities prior to 1900. The rules regarding who was allowed to vote were more notable in their broad exclusions (of women, for example) than for how voters should register or record their ballots. Voting began to change in the late 19th and early 20th centuries when, in the South, legislatures passed voting laws that newly excluded African Americans and poor white men, by means of poll taxes, literacy tests, and infamous "grandfather clauses," which prohibited anyone who had not voted in the 1860 election and their linear descendants from voting. Such restrictions were not unique to the South, although it had, by far, the most racially restrictive public laws. Legal segregation in public transportation and services underwrote the second-class citizenship of African Americans in the region, and laws that severely restricted voting only confirmed their status. By the 1890s, many northern state legislatures also revised rules and procedures for voting, introducing the Australian, or secret, ballot on the one hand but also new restrictions of voter eligibility on the other. Partially as a result of these new laws, voter participation among men dropped precipitously in the early 20th century. At the same time, these

were the decades during which the long battle for WOMAN SUFFRAGE finally achieved its objective.

Political participation through voting and political office was and is only one aspect of citizenship. Being a citizen, especially a male citizen, meant not only rights but obligations to pay taxes and perform jury duty and service in the militia. By the 20th century, state militias were chiefly voluntary; but the coming of WORLD WAR I brought military conscription for men. In response to President WOODROW WILSON's declaration of war, CONGRESS passed the SELECTIVE SERVICE ACT of 1917. Military service became a means for the AMERICANIZATION of young immigrant and ethnic men; it also stirred demands for greater equality among African Americans in the aftermath of the war. VETERANS of the war demanded more from their governments on returning home than they had before their service, and veterans' organizations such as the AMERICAN LEGION played an increasing role in government foreign policy as well.

The charged political atmosphere during the war focused on the continued presence and influence of "hyphenated Americans" and radical aliens in the country. Pressure to conform to American standards, to bar or confine the teaching and use of languages other than American English, and to either reorganize or disband ethnic organizations in the name of national unity led to new efforts to assimilate those immigrants already in the United States. Americanization campaigns and local Americanization committees sought to influence and transform school curricula, pressure resident aliens to take citizenship papers or to leave the country, and influence employers to provide programs to educate immigrant workers. The RED SCARE that followed the war sought to control public opinion, suppress radical organization, and promote conservative patriotism as the true expression of citizenship.

The years from 1900 to 1930 slowly expanded the definition of citizenship by creating new rights and entitlements. Social citizenship in the United States, however, lagged behind European nations in how the nation provided for the unemployed, sick, and injured. New government programs, most organized at the state level, such as MOTHERS' PENSIONS and WORKMEN'S COMPENSATION, addressed a specific population and severely restricted eligibility. The only national program in place during the Progressive Era was the system of Civil War pensions. World War I veterans, in contrast, only became eligible for a future SOLDIERS' BONUS with the passage of the Soldiers' Adjusted Compensation Act in 1924.

Along with the reform of election and immigration laws, the long-awaited granting of woman suffrage and the reform of laws concerning married women's citizenship in the CABLE ACT rationalized the eligibility for and content of American citizenship. While the new laws excluded

specific groups from entry into the country and/or eligibility for national citizenship, immigration law now clarified the barriers to entry and participation. Moreover, the Nineteenth Amendment granting women the right to vote removed the single most important exclusion from equal citizenship in a democracy. State laws and local ordinances continued to regulate and restrict political and economic participation by minority groups, but the overall impact of the Progressive Era legislation was to formalize the laws governing citizenship and to expand its meaning in economic and political life.

## civil liberties

The preamble to the Constitution commits the United States to a government that secures "the blessings of liberty" to all future generations. That promise guarantees to protect the rights of individuals and the minority against the majority will and the actions of government. In short, civil liberties are those personal rights protected against the common will.

The SUPREME COURT entered the 20th century believing that courts were actively protecting Americans' liberty by preventing government from infringing upon or violating individual contract and property rights. In the wake of the *Slaughterhouse Cases*, state and federal courts overturned legislation that regulated industry, taxed income, or provided for the common welfare. These laws restrained government intervention in the economy but also restricted the rights of political dissenters. At the same time, many Americans espoused energetic government that would intervene in and legislate for the general welfare. In response to these sometimes contradictory impulses, the courts began to direct their focus to liberty concerns flowing from the First Amendment's speech, press, religion, and assembly guarantees. Essentially the courts, and in particular the Supreme Court, sought to balance what Zachariah Chaffee in 1920 characterized as "a conflict between two vital principles . . . between order and freedom."

Beginning with WORLD WAR I, the Wilson administration and CONGRESS perceived the need for uniform support of the nation's war efforts. Accordingly, Congress passed a series of laws to put the nation on a war footing,

among them the ESPIONAGE ACT of 1917. That act made it unlawful to “utter, print, write or publish any disloyal” language about the government or its war efforts. Charles Schenck was convicted of violating that law by advocating resistance to the military draft. Justice OLIVER WENDELL HOLMES, writing for a unanimous Supreme Court in *SCHENCK v. U.S.*, affirmed Schenck’s conviction, finding that the First Amendment did not protect speech that presented a “clear and present danger,” one of the “evils that Congress has a right to prevent.” Later that year, the Court in *Abrams v. U.S.* affirmed the conviction of Jacob Abrams for advocating strikes against munitions factories. In that case, Holmes dissented from the Court’s holding, arguing that the government must establish a “present danger of immediate evil” for speech to be unlawful. While the Court disagreed, Holmes’s powerful dissent carried significant future weight.

Immediately following the war and in response to radical movements and the RUSSIAN REVOLUTION, President Wilson’s attorney general, A. MITCHELL PALMER, created an antiradicalism division of the Department of Justice and named J. Edgar Hoover to run it. Between 1919 and 1920, that division arrested more than 6,000 people as radicals in what became known as the RED SCARE. States also passed various laws designed to protect against radical elements. In response to those efforts, ROGER BALDWIN formed the AMERICAN CIVIL LIBERTIES UNION (ACLU) in 1920 from an earlier organization that had protected war dissenters. Among its missions, the ACLU provided litigation support in defense of individual liberties and labor rights, including the defense of John Scopes for teaching evolution in Tennessee.

Historically, the Bill of Rights only applied to federal government and not to state actions. By the 1920s, however, state efforts to control radicals raised the issue whether the First Amendment should restrict state authority over speech. In response, the Supreme Court in *Gitlow v. New York* (1925) declared that speech and press freedoms “are among the fundamental personal rights and liberties” protected by the Constitution against encroachment by the states. While the Court sustained Benjamin Gitlow’s conviction for advocating proletarian revolution, speech freedoms now protected individuals against state and federal abuse. As in *Abrams*, Justice Holmes, this time joined by Justice LOUIS BRANDEIS, argued that the conviction be overturned. In powerful language, Holmes defended the need for speech, offering that, “every idea is an excitement” that must be heard in a democratic society, unless that speech resulted in a substantial and immediate danger. The majority felt otherwise, and Holmes’s dissent would not find general acceptance until after 1930.

In an article in 1890 and later in a dissent in 1928 in *Olmstead v. U.S.*, Brandeis sowed the seeds of privacy-

based civil liberties that were only later accepted. In his article, *The Right to Privacy*, Brandeis joined with fellow author Samuel Warren to propose that the Constitution guaranteed “the right to be let alone.” While on the Court, Brandeis proclaimed that “the makers of our Constitution . . . conferred, as against the government, the right to be let alone—the most comprehensive of the rights and the right most valued by civilized man.” This concept laid the foundation for the constitutional right of privacy that underlies much of modern jurisprudence and thought.

The Supreme Court between 1900 and 1930 most often struck a balance in favor of government restrictions on individual rights. However, through powerful dissenting arguments, Supreme Court justices planted the ideas of civil liberty that future Courts would embrace. Those ideas form the basis of our modern views of free expression, privacy, and liberty.

## Clark Memorandum

In 1928 Under-Secretary of State J. Reuben Clark issued a report that repudiated the ROOSEVELT COROLLARY, a policy that had extended the reach of the Monroe Doctrine by stating that the United States not only would protect the Western Hemisphere from interference by the major powers of Europe but also promised to intervene in the domestic affairs of Latin American countries if they failed to protect American interests. The Clark Memorandum rejected this position, stating that the Monroe Doctrine could not be used to justify American intervention in the region. The doctrine had referred only to European interference, not to the right of the United States to intervene in Latin American nations.

Between 1929 and 1933, President Herbert Hoover followed policies outlined in the Clark Memorandum. He made a 10-week goodwill tour in Latin America before he was inaugurated into office. His administration moved to withdraw troops from Haiti. The president announced that the United States would recognize any new government that came to power in the region, regardless of whether or not the United States favored it. In addition, he refused to allow American intervention when several Latin American nations defaulted on their debts during the world economic crisis in 1931.

Even though the Clark Memorandum rejected the Monroe Doctrine as the rationale for intervention, it did not preclude entirely the U.S. right to interfere in Latin America. In practice the memorandum meant that the United States simply found other explanations for intervention in the region.

The Clark Memorandum set a precedent for the Good Neighbor Policy of President Franklin Delano Roosevelt. In 1933, Roosevelt declared the policy of good neighbors, which was intended to express mutual respect for the rights of all countries in the Western Hemisphere. The Good Neighbor Policy represented a shift in the means the United States used to ensure its power in the region. Rather than use military intervention, American administrations utilized economic or diplomatic leverage to sustain a foothold in Latin America.

### Clayton Antitrust Act (1914)

The Clayton Antitrust Act of 1914 was an effort to clarify the Sherman Antitrust Act of 1890 and protect labor unions from antitrust rulings. The need to change the Sherman Act grew more apparent between 1896 and 1914 as labor unions faced a barrage of antitrust actions. When workers from many different industries joined labor unions in increasing numbers after 1900, the chief beneficiary proved to be the conservative AMERICAN FEDERATION OF LABOR (AFL). Led by Samuel Gompers, the AFL focused its efforts on organizing skilled, white male workers. While some business leaders, such as those in the NATIONAL CIVIC FEDERATION, viewed the AFL as a safe alternative to more radical unions like the INDUSTRIAL WORKERS OF THE WORLD (IWW), the majority of corporations resisted all organizing efforts. The courts proved to be their first line of defense.

Between the 1890s and 1914, corporations, judges, and politicians opposed to unionization used the Sherman Antitrust Act to break strikes either through intimidation or injunctions against strikes and boycotts. The Sherman Act originally was enacted to prevent monopolies, ensure competition, and check the growing power of corporations. In actual practice, however, antitrust legislation was used primarily to prevent the spread of organized labor, with conservative, antiunion judges ruling that unions and strikes interfered with interstate commerce and free trade.

The AFL concluded that federal antitrust legislation constituted the greatest impediment to further organizing. When the labor federation changed its position on political nonpartisanship and helped secure the election of Demo-

cratic presidential candidate WOODROW WILSON in 1912, AFL president Samuel Gompers used his influence to pressure the new president and the DEMOCRATIC PARTY to overhaul federal antitrust legislation. When finally enacted, the Clayton Antitrust Act established that workers had the right to organize and that strikes were not illegal. It further restricted federal injunctions against unions and legal strikes.

Gompers insisted that the Clayton Act was “the greatest measure of humanitarian legislation in the world’s history” and would be remembered as labor’s “Magna Carta.” However, President Wilson was reluctant to enact “class legislation” and allowed powerful congressmen to insert loopholes in the law. The changes ensured that employers would continue to benefit from judicial intervention in labor disputes. Over the long term, the Clayton Act proved largely ineffective, prompting critics from both the left and the right to question Gompers’s tactics. Corporations opposed to organized labor were still able to rely upon judicial relief, as anti-union judges largely ignored the legislation and continued to issue restrictive injunctions.

### Committee for Public Information (Creel Committee)

President WOODROW WILSON formed the Creel Committee on April 14, 1917, to mobilize public support for American entry into WORLD WAR I. Prior to the war, there was widespread support for the nation to maintain its NEUTRALITY in international conflicts. Although many prominent public figures supported American intervention, others vocally championed pacifism. Among both radical and progressive organizations were voices that urged that the war raging in Europe was nothing more than a fight between competing capitalist factions and that the United States should isolate itself from the conflict. Isolationist and pacifist sentiment was strong enough that, in seeking reelection in 1916, President Wilson ran on the slogan “He kept us out of war.”

In order to mobilize public support for American involvement, the Wilson administration launched an all-out propaganda campaign headed by the Committee on Public Information, or the Creel Committee. Headed by journalist George Creel, the committee was created on April 14, 1917. Although Wilson had run on the promise of keeping the country out of the war, the administration had sided with the British and French from the outset. As a result, part of the mission of the Creel Committee was to

persuade the public that Germany was responsible for the war. The pro-war, anti-German efforts of the Creel Committee neglected few venues for propaganda, including renaming sauerkraut “liberty cabbage” and German measles “liberty measles.” It encouraged public high schools to drop the instruction of the German language and supported banning German books and music.

Run almost single-handedly by Creel, the Committee for Public Information hit upon the idea of the Four-Minute Men to spread its message. The Four-Minute Men addressed movie audiences to underscore the importance of registering for the draft, buying war bonds, and rationing food and war-related materials. Eventually, the Four-Minute Men spoke to public gatherings throughout country. Creel also enlisted the support of the entertainment industry. He got some of the nation’s biggest stars, including Douglas Fairbanks, Mary Pickford, George M. Cohan, Charlie Chaplin, and others, to create patriotic movies and

Poster for *Pershing's Crusaders*, the first official American war film released by the Committee for Public Information (Library of Congress)

songs. The committee produced pro-war movie shorts and distributed thousands of pamphlets exhorting the need for vigilance against German aggression at home as well as abroad. In many overt and subtle ways, the Creel Committee fueled anti-German sentiment. Such national prejudice frequently spilled over into discrimination or even hostility toward German Americans.

The Creel Committee had the additional objective of undermining the legitimacy of those who opposed the war. It did so by churning out propaganda that portrayed the war as a “Crusade for Democracy.” In order to combat radical organizations that opposed the war, the efforts of the Creel Committee were reenforced by the ESPIONAGE ACT of 1917 and the SEDITION ACT of 1918. The Espionage Act prohibited the distribution of leftist antiwar material and imposed a \$10,000 fine and/or prison term of up to 20 years for those who violated the law. Although controversial, the law was upheld by the Supreme Court in *SCHENCK V. UNITED STATES* (1919). Similarly, the Sedition Act made it a crime to “willfully utter, print, write or publish any disloyal, profane, scurrilous, or abusive language” about the government or to “willfully urge, incite, or advocate any curtailment of production necessary or essential to the prosecution of the war. . . .”

The Creel Committee was largely successful at mobilizing support for the war. Within months, more than 10 million men had signed up for the military draft; and defense production and liberty bond sales skyrocketed during the war. The committee effectively silenced critics of the war with its campaigns. Between 1917 and 1919, it spent more than \$2 million and helped create a rising tide of pro-war patriotism. Many foreign-born workers came to believe that the war was one for democracy at home as well as abroad, and they carried the spirit of industrial democracy into postwar labor struggles, such as the STEEL STRIKE OF 1919. In contrast, conservative politicians and business leaders, many of whom viewed strikes as threats to democracy, tapped into this wave of patriotism once the war had ended. They argued that Bolshevik sympathizers and supporters of the RUSSIAN REVOLUTION inflamed worker discontent and incited political demonstrations. By the end of the war, under the influence of such propaganda, many had come to believe that all dissent was “un-American.” The conservative backlash was largely effective in its support for the RED SCARE and other postwar labor repression. By 1921, political radicals, liberals, progressives, and labor unions were all in retreat.

## Communist Party

In the aftermath of the RUSSIAN REVOLUTION of 1917, American radicals and socialists formed several competing communist parties in 1919. In March 1919, the Third Communist International announced that it would actively support and work toward the spread of communism throughout the world. American socialists who supported the Russian Revolution met in September 1919 to form an American Communist Party. Disagreements over the pace at which revolution should be spread resulted in the formation of two parties—the Communist Labor Party and the American Communist Party. JOHN REED, who had been one of the few Americans to witness the Russian Revolution firsthand, was among those who formed the smaller Communist Labor Party. The American Communist Party was the party officially recognized by the Soviet Comintern, which was responsible for overseeing the spread of communism.

While many American socialists supported the goals of the Russian Revolution, rival parties kept the Left relatively weak. It soon fell under attack. The strike wave of 1919 resulted in a conservative backlash against American radicals. In April 1919, 36 government officials, including Attorney General A. MITCHELL PALMER and Supreme Court Chief Justice OLIVER WENDELL HOLMES, received “May Day” bombs. Palmer and the federal government responded between November 1919 and January 1920 by launching a series of raids against radicals and suspected radicals, especially those of foreign ancestry. The RED SCARE of 1919–20 severely undermined the effectiveness of communist parties at all levels.

In 1924, under orders from the Soviet Comintern, the two communist parties agreed to merge. The new party went through several different names before settling on the Communist Party of the United States of America (CPUSA) in 1929. When the two factions joined in 1924, the party launched its weekly newspaper, the *Daily Worker*, which at its peak had a circulation of 35,000. Throughout much of the 1920s, the Communist Party had a small, but extremely dedicated following. In 1929, for example party officials claimed to have 7,000 members. The party’s highest vote total in any presidential election came in 1932 when William Z. Foster received 102,000 votes. The Socialist Party of America remained free of any hint of foreign control and consistently had a much larger following, with its perennial presidential candidate, EUGENE VICTOR DEBS, garnering close to a million votes in 1912 and again in 1920. Still, the postwar split among factions had denied the more moderate Socialist Party of support.

Despite this small following, the Communist Party had a significant impact on political and social developments throughout the 1920s. Led by Foster and James P. Cannon, the Communist Party defended the rights of workers,

opposed the KU KLUX KLAN and capital, and it advocated equality for African Americans and immigrants. In 1925, the Communist Party formed the International Labor Defense Fund (ILDF) to defend workers and others it viewed as under attack from the “ruling class.”

One of the driving forces behind the ILDF was the SACCO AND VANZETTI case. The two Italian immigrants had been tried, convicted, and sentenced to death for armed robbery and murder. The case became a cause célèbre for many on the political left who were convinced of Sacco and Vanzetti’s innocence. Although the ILDF’s defense of Sacco and Vanzetti ultimately proved ineffective, it earned the Communist Party a reputation for defending those who opposed American capitalism. The Communist Party also attempted to recruit African Americans throughout the 1920s. The Sixth World Congress of the Communist International in 1928 declared African Americans an oppressed people. Party leaders were instructed to increase their efforts on behalf of African-American workers. The party made important inroads with African Americans in pockets throughout the South and in large urban centers, such as Harlem and Chicago. Despite these efforts, the Communist Party remained weak and largely ineffective until the Great Depression in the 1930s.

## Congress

For most of the 19th century, the dominant branch of the federal government was the Congress. Major political conflicts and initiatives for reform arose primarily from the Senate and the House. Its leaders became household names, and its failure to contain political conflict, from the sectional debate over slavery that led to the Civil War to arguments about immigration, had significant consequences for the nation. Between 1900 and 1930, however, the Congress lost power while the presidency gained in stature. As the United States emerged as a world power, the presidency took on a new role in governing the nation. Compared to most of the 19th-century presidents, THEODORE ROOSEVELT and WOODROW WILSON had significantly greater power to initiate legislation, create new agencies and bureaus, appoint and oversee government employees, set aside national lands and resources, and allocate funds. While Congress continued to play a vital role, the expanding powers of the Executive Branch and greater public skepticism about Congress diminished its prestige and authority.

In these decades, the REPUBLICAN PARTY dominated the U.S. Congress, much as it did the presidency. Between 1900 and 1911 and from 1919 until 1932, Republicans ruled the House of Representatives; and from 1900 to 1913 and 1919 to 1932, they also controlled the Senate. It was not simply that the Republicans held an edge over the Democratic Party in number of seats. During most of the period, the Republicans had a substantial majority that made it possible to dominate the legislative agenda. These majorities also reinforced the power of the leaders of the House and Senate, as long as party discipline was in force. In particular, the Speaker of the House, JOSEPH GURNEY CANNON of Illinois, had an iron grip on the House legislative agenda. His power derived from the House custom of giving to the Speaker of the House the power to appoint committee chairs. Under Cannon's term as Speaker (from 1903 to 1911), the control of such appointments was refined to an art. His Old Guard Republicans simply kept legislation from the floor of Congress. These rules not only concentrated power in the hands of the Speaker and the majority party, they also became the chief obstacle to passing reforms.

Rebelling against "Cannonism," the Congress instituted fundamental changes in how it governed itself. As PROGRESSIVISM swept through the Midwest and western states, newly elected Republicans displayed a growing discontent about the power of Cannon and the "Old Guard." Under the administration of President WILLIAM HOWARD TAFT, Cannon continued to block any legislation that threatened to change the status quo. Most galling was the fight over the tariff. Long a supporter of high protective tariffs, Cannon undermined the effort to revise duties downward in the PAYNE-ALDRICH TARIFF ACT and persuaded Taft to sign a bill that raised some rates. The new alliance between Taft and Cannon suggested that it was time to challenge the speaker's authority. Senators ROBERT LA FOLLETTE of Wisconsin, HIRAM WARREN JOHNSON of California, and Representative George Norris of New York formed the National Progressive Republican League for that purpose. By 1911, they had dismantled Cannon's regime in the House by working with other congressional Republicans and reform Democrats to change the rules by which the House was governed. Committee chairs were now determined by seniority, not appointed by the Speaker of the House.

Ironically, the new system of seniority, in which committee chairmanships were determined by the years that a senator or representative served, gave even greater weight to conservative politics. It shifted regional power to the South, where incumbents were elected for consecutive terms and thus could gain and hold on to positions in critical committees, like committees on Ways and Means and Rules in the House and Finance and Foreign Relations in the Senate.

### conscription

The United States entered WORLD WAR I on April 6, 1917. Its ground forces at the time numbered only 128,000 men with only one infantry division. General JOHN JOSEPH PERSHING, newly appointed commander of the AMERICAN EXPEDITIONARY FORCE, called for a force of three million men that, in his assessment, was needed to claim victory in the war. President WOODROW WILSON's administration was faced with a dilemma as to how best to fill the gap between these two figures. The president turned to a military draft, or conscription, as the means to build an army.

Since its inception, the United States had a tradition of voluntary military service. Only during the Civil War, in fact, had a draft been relied upon to provide soldiers for wartime. Even during that crisis, the imposition of a draft had caused antidraft riots in the anthracite region of Pennsylvania and in New York City. For that reason, President Wilson had hoped to rely on a call to public service. Conscription, however, was the only way to raise a huge army in a short time.

Initially, Wilson opposed a military draft, but he later supported and defended it as a "disagreeable but necessary evil." There was, at the time, some public opposition to the "European war" and to conscription specifically. It was a long six weeks between the time Congress declared war and the passage of the SELECTIVE SERVICE ACT of 1917, which implemented the military draft. Wilson appointed General Enoch Crowder to head the new Selective Service System. All men between the ages of 18 and 45 were required to register. No exemptions, outside of those in vital wartime industries, were allowed. No one was allowed to hire a substitute, as was the case during the Civil War. Crowder set up local draft boards staffed by community volunteers, who decided who would be sent into, or deferred from, military service. The use of community volunteers, in addition to government propaganda promoting patriotic service, prevented "the streets from running red with blood" on registration day, as many had feared.

The COMMITTEE FOR PUBLIC INFORMATION (CPI), created by President Wilson shortly after America joined the war in 1917, raised public support for the war effort through propaganda. War posters urged Americans to join the army. Movie stars, marching bands, and billboards celebrated those who "did their duty." Fighting to keep the world "safe for democracy" was a potent recruiting slogan.

Recruitment poster for the U.S. Marines, ca. 1918 (*Library of Congress*)

Speakers from the CPI gave speeches in schools, camps, and public gatherings of all kinds. They were highly effective in inspiring patriotic fervor and stirring anti-German feeling.

Registration day, for those who did voluntarily register, was a day for patriotism. Twenty-four million men responded to the call and registered, and in only a few months, the United States Army grew to over four million soldiers. For the first time in the history of the United States, women also were allowed to join as volunteers. Twenty-one thousand women served in the Army and Navy Nurse Corps, and another 13,000 worked as clerks for the U.S. Navy and Marine Corps. Their service came less as a response to compulsory military service than as an expression of patriotism or a desire for adventure.

To maintain the peace and ensure the success of the draft, Congress and the Wilson administration instituted a number of measures. Congress passed the ESPIONAGE ACT of 1917 and the SEDITION ACT of 1918 as well as the TRADING WITH THE ENEMY ACT, all to suppress popular opposition to the conscription in speech, writing, or public protest. The Justice Department prosecuted antiwar socialists and members of the radical INDUSTRIAL WORK-

ERS OF THE WORLD (IWW) under these acts. Government officials also prompted support for military service by playing on public fears of violent radicals and German spies who, they said, were active throughout the United States. CPI posters encouraged citizens to report anyone who they thought might have pro-German sympathies. In fact, approximately 337,000 men refused to answer the draft call. Called “slackers” in the jargon of the day, many of these men were hunted down by civilian agents of the Justice Department. Under the name of the American Protective League, they organized raids in New York City. In addition, some 65,000 men objected to war and became conscientious objectors, due to their religious beliefs. Many of these were also imprisoned. By World War II, the idea of a compulsory military draft in the United States was no longer foreign. Conscription became the major means by which the ARMED FORCES raised troops for foreign wars until the 1970s.

### **Coolidge, Calvin John** (1872–1933) *president of the United States*

A staunch conservative and supporter of business, Calvin Coolidge became the 30th president of the United States when he assumed office following the death of WARREN GAMALIEL HARDING. Born in 1872 in Plymouth, Vermont, Coolidge was raised by his father after his mother's death. Active in politics, his father held several jobs, including farmer and storekeeper. He taught young Calvin to be honest, hardworking, fair, religious, and conservative. Coolidge was the first in his family to attend college, graduating from Amherst College in Massachusetts in 1895. He then studied law privately and passed the bar in 1897. In 1905, he married Grace Anna Goodhue, who was a teacher at the Clark Institute for Deaf Children.

A lifelong Republican, Coolidge entered politics at an early age. He first ran for public office in 1898, winning a seat on the city council of Northampton, Massachusetts. Over the next decade, Coolidge held numerous elected offices in Northampton, finally becoming mayor in 1908. Though reserved, Coolidge developed into a capable public speaker and earned a reputation for honesty, fairness, compassion, party loyalty, and fiscal conservatism. He proved willing to support efforts to improve the lives of those less fortunate, so long as it didn't cost too much money. Elected to the Massachusetts Senate in 1911, Coolidge became the lieutenant governor in 1915. In 1918 he was elected governor of Massachusetts. As governor, Coolidge supported the

ratification of the Nineteenth Amendment giving women the right to vote, efforts to reduce the workweek for women and children, and other progressive reforms. He was not, however, aligned with Republican progressives who had supported THEODORE ROOSEVELT, and his support for progressive legislation had limits.

Coolidge first entered the national spotlight in 1919. For several years, police officers in Boston had struggled to improve their pay and working conditions without success. Frustrated by the lack of response from city officials, officers formed the Boston Social Club and applied to the AMERICAN FEDERATION OF LABOR (AFL) for union recognition. Boston city officials refused to recognize the union or meet its demands for pay increases. On September 9, 1919, three-quarters of the city's police force went out on strike. The move infuriated local government officials, who appealed to Coolidge and President WOODROW WILSON for help. The 1919 police strike occurred at the height of a wave of postwar strikes and radicalism, which included the STEEL STRIKE OF 1919 and the SEATTLE GENERAL STRIKE. Led by Attorney General A. MITCHELL PALMER, the federal government responded by cracking down on

organized labor, progressive reformers, radicals, and anyone who seemed to threaten the social order. Initially, Coolidge appeared reluctant to act; but when rioting broke out in Boston, he responded swiftly and dramatically. Stating that, "There is no right to strike against the public safety by anybody, anywhere, any time," Coolidge called out the state militia and permitted the Boston police commissioner to fire any striking officers. New recruits replaced the striking officers who were not given their jobs back when the strike ended.

The swift and aggressive manner in which Coolidge dealt with the strike earned him high praise from conservatives throughout the country and catapulted him into the 1920 race for the Republican presidential nomination. The Republican convention nominated Warren G. Harding as its presidential nominee and selected Coolidge to be the party's vice presidential candidate. Harding and Coolidge aligned themselves with the party's Old Guard and in opposition to party progressives. Promising to return the country to prosperity and "normalcy," Harding and Coolidge defeated their Democratic rivals, James Cox and Franklin D. Roosevelt, in a landslide. The electoral vote was 404 to 127. Between taking office in 1921 and 1923, Coolidge played a barely visible role in the Harding administration and received little national attention. By 1922, when President Harding found himself besieged by scandal and corruption, his health took a turn for the worse. He died of a heart attack on August 2, 1923, and Coolidge took the oath of office at 2:47 A.M. the next day.

When Coolidge assumed office, he was immediately confronted by rampant rumors of scandal and corruption among Harding's cabinet officers. Many of the charges of corruption aimed at the Harding administration centered on Attorney General Harry Daugherty. Initially reluctant to fire one of Harding's closest confidants, Coolidge finally asked Daugherty to resign in 1924. That same year, an even larger scandal, known as the TEAPOT DOME scandal, became public. Public confidence in the presidency was at an all-time low. Coolidge confronted these scandals head-on and quickly removed from office anyone involved. In office, he continued to be reserved, earning him the nickname "Silent Cal." Efficient, productive, and honest, Coolidge convinced the nation that the government was in the hands of someone they could trust. He easily won the Republican presidential nomination in 1924. With running mate CHARLES GATES DAWES, Coolidge handily defeated challenges from John W. Davis, the DEMOCRATIC PARTY nominee, and ROBERT LA FOLLETTE, the candidate of the reformed Progressive Party. Coolidge won the electoral vote 382 to 136 for Davis and 13 for La Follette.

Elected in his own right, Coolidge presided over the country during a time of general economic prosperity.

Calvin Coolidge poses with his two sons, 1924 (*Library of Congress*)

Between 1922 and 1927, the economy grew 7 percent annually. Although the economic prosperity primarily benefited corporations and the wealthy, the general public benefited as well. Coolidge and his secretary of commerce, Herbert Hoover, believed that the best way to perpetuate this economic boom was for the federal government to give whatever assistance was necessary to the private sector. As Coolidge put it in 1925, “the business of America is business.” Under his secretary of the treasury, ANDREW WILLIAM MELLON, one of the administration’s primary objectives was to reduce federal taxes. Arguing that a large tax cut was the best way to ensure continued prosperity, Coolidge proposed a series of reductions that would benefit all taxpayers and eliminate income taxes for the poorest citizens. These cuts were passed in 1926.

Foreign policy issues also shaped Coolidge’s presidency. Anti-Japanese sentiment had been growing, especially in the West, as more Japanese immigrants came to the United States. Congress passed legislation that prohibited Japanese from entering the country and set strict quotas for other Asian immigrants. Following upon the QUOTA ACT of 1921, the new act sharply reduced the quota for immigrants entering the United States from southern and eastern Europe. Though Coolidge personally opposed the legislation and attempted to block it, he agreed to sign the NATIONAL ORIGINS ACT of 1924. When in 1919 Congress had refused to join the LEAGUE OF NATIONS following the end of WORLD WAR I, the nation’s role in world affairs became unclear. Not wanting to antagonize isolationists in the REPUBLICAN PARTY, Coolidge was still convinced that the nation ought to be more active internationally. In 1924, he secured the passage of the DAWES PLAN, which reduced German reparation payments and secured American loans to stabilize the German economy. His administration also convinced the Senate to pass the KELLOGG-BRIAND TREATY outlawing war. Although it lacked an effective enforcement mechanism and quickly proved unrealistic, the pact captured the optimistic mood of the 1920s. In the final analysis, however, the Coolidge administration had no great vision or overarching agenda other than perpetuating the economic boom that had begun in 1922. To this extent, Coolidge could claim success; but by 1929 it was clear that the boom of the Roaring Twenties had been built on excess consumer spending and overproduction. Not only were real wages stagnant and unemployment figures on the rise, but also certain sectors such as AGRICULTURE, textiles, and coal had never recovered from the postwar recession of 1921–22. When the inevitable slowdown came, the hands-off approach established by Coolidge and continued by his successor, President Herbert Hoover, resulted in a complete economic collapse and the Great Depression. Coolidge died in 1933, only a few years after he left office.

### cosmetics and beauty industry

Prior to the 1920s, cosmetics were part of the prostitute’s dress. In Victorian America, women who used cosmetics contradicted expectations for women to be pious and selfless. Women should not, after all, draw attention to their appearance. As the United States entered the modern era after WORLD WAR I, advertisers and marketers sought to define what made women “modern.” Their definition rested on consumption of cosmetics and other beauty products.

Partially the result of publicity techniques developed during the war, the ADVERTISING industry took off in the 1920s. From the perspective of advertisers, Americans had to be taught how to shed their puritanical notions of thrift and how to consume. While earlier economic growth periods had relied on manufacturing, it was the consumer economy that generated growth in the 1920s. The cosmetics industry was an important part of that development. The war also provided better-paying jobs and greater economic and social independence for women. With more disposable income, women chose to purchase cosmetics. The proliferation of chain stores and dime stores in cities further expanded the availability and attraction of new beauty products.

Hollywood contributed significantly to the appeal of cosmetics. Colored eyes and lips, powder, and rouge were tools that Hollywood makeup artists like Max Factor and Helena Rubinstein used to adorn female actresses. As Hollywood increasingly set the cultural trends for the rest of the country, cosmetics became more acceptable for women to wear. They were encouraged to shed their selfless images for pretty faces that required powder and rouge. Advertisers emphasized that women needed to attract men through their appearance and their smell. To do so, women needed lipstick, mouthwash, and perfume. Attracting men was one goal that advertisers promised women would achieve with cosmetics; happiness was another. It could be attained through material acquisition and more self-indulgent behavior. Hair and clothing styles changed alongside the emergence of cosmetics. Beauty parlors proliferated, which was another venue for cosmetics sales. In 1927, chemical inventions allowed women to “perm,” or permanently wave, their hair.

The emphasis on physical attraction reflected changing attitudes about gender relations. Increasingly, women

and men engaged in sexual relations before marriage, often with the person they intended to marry. This trend counteracted behavior during much of the Victorian era, when men often engaged in premarital sex with prostitutes while women were encouraged to be chaste.

Cosmetics were disproportionately associated with younger women who wished to be defined as modern. Younger women's use of cosmetics sometimes resulted in the ire of Americans who were a generation older. Cosmetics also defined part of the youth culture that wished to distance itself from parents by smoking, consuming alcohol, dancing, and listening to JAZZ.

Much of the cosmetics industry focused on changing the attitudes of the white middle-class in order to accept images of women that differed from the selflessness of an earlier time. However, what came to be labeled as "modern" was already being practiced by single working-class women who challenged social mores about women's proper behavior long before middle-class youth embraced cosmetics and aesthetic definitions of beauty. African-American women also invested in the cultivation of beauty, defining their own race-specific standards. Indeed, Madam C. J. Walker and Annie Turnbo Malone made their fortunes selling cosmetic products to black consumers. Cosmetics became and remained a major industry in these years.

### criminal justice

The criminal justice system in the United States underwent dramatic changes in the late 19th and early 20th centuries. At the turn of the century, police departments across the country attempted to professionalize their workforce. There was an effort to lift the standards of police work by training men and establishing a merit system for hiring and promotion. August Vollmer, police chief of Berkeley, California, was a leader in the movement to upgrade the standards of the police force. In 1916, Vollmer developed the first academic law-enforcement program at the University of California at Berkeley. By 1915, 122 out of the nation's 204 largest police departments were regulated under civil service systems.

Despite efforts to modernize policing across the country, police departments still faced the problems of discipline,

graft, corruption, and police brutality. In the early 20th century, "nightstick" justice was still common. For example, a policeman new to the New York City police force was told that his job was to "protect the good people and treat the crooks rough." His role was to protect law-abiding citizens. At the same time, the police who walked the city streets presumed that people with past criminal records were guilty and needed to be intimidated through brute force.

In addition to the police force, widespread reforms during the Progressive Era permanently altered the criminal justice system. Between 1900 and 1920, progressives initiated many reforms in the treatment and punishment of offenders. Reformers set out to establish individualized programs for rehabilitation. In state after state, a broad coalition of judges, district attorneys, wardens, superintendents, citizens, settlement house workers, criminologists, social workers, psychologists, and psychiatrists helped to pass probation, parole, and indeterminate sentencing laws for adult offenders, and created juvenile courts for delinquents.

In the early 20th century, probation became a common alternative to incarceration for adult offenders. Probation was the immediate release of a criminal into the community after conviction. Limitations were placed on the freedom of offenders, and they remained under supervision by authorities. In 1900, six states had probation systems; by 1920, 33 states provided for probation. Another alternative to traditional incarceration was indeterminate sentencing, when the offender was sent to prison for an indefinite term until the criminal was "cured." Before 1900, judges set the specific term of sentencing for adult offenders. After 1900, judges set minimum and maximum terms. Meanwhile, parole boards held discretionary power and decided the precise time of release within the limits set by the judge. The parole system spread across the country as rapidly as other innovations in criminal justice. In 1900, only a handful of states allowed for paroles. By 1923, over half of all offenders in the nation were released by parole.

Between 1900 and 1920, reformers created a new juvenile justice system. Progressives thought that it was inhumane to lock up juveniles in the same institutions as habitual criminals. Under these circumstances, reformers argued, the prison system of the 19th century served as schools in which troubled youths learned the ways of vice. Consequently, in the late 19th century, many states had set up separate reform schools for boys and girls as an alternative to prison. Expanding on the idea, progressives created special criminal courts to administer juvenile justice. The juvenile courts gave the criminal justice system broad discretionary authority in dealing with delinquents, troubled youths, and neglected and abused children. The juvenile courts originated from a movement of "child savers," led by settlement house workers such as JANE ADDAMS at Hull-

House in Chicago, Illinois. In 1899, a groundbreaking law in Illinois set up a juvenile court for Cook County, which included the city of Chicago and its suburbs. Although the Illinois law separated juveniles from adult offenders, it continued to place delinquents in the same institutions as children who had not broken the law but were abandoned, abused, or neglected.

The juvenile courts extended state control over poor children and imposed middle-class Protestant values on them and on working-class families who were, more often than not, Catholic or Jewish immigrants. Many officials who served on juvenile courts considered delinquency not an illegal act but a “state, condition, or environment into which the child enters.” Thus, they intervened to prevent troubled children from becoming criminals, rather than institutionalizing children after they had already broken the law. On the other hand, parents were not wholly victims of the juvenile justice system. Instead, working-class and immigrant parents used the courts as a tool of last resort to control their rebellious children. More often than not, parents, not social workers or policemen, brought troubled children into court.

Early in the 20th century, the movement against vice and immorality reached its peak, climaxing during the PROHIBITION era. In many cases, vices were made illegal by new legislation in the 20th century, but the public and authorities still either tolerated the activities or looked the other way. For example, gambling was an illegal vice, and many cities cracked down on gambling establishments periodically. But after a wave of arrests, gambling tended to bounce back.

The campaign against sexual immorality met with more success. In 1910, Congress passed the MANN ACT, or “White Slave Traffic Act.” Intended to prevent women who lived in cities from falling prey to a life of immorality and prostitution, the Mann Act prohibited harboring women across state lines for the purposes of commercialized vice. The Red-Light Abatement Movement, the effort to close down vice districts where houses of prostitution were concentrated, also peaked in the early 20th century. Between 1910 and 1917, at least 43 cities created vice commissions that investigated the underworld of vice and prostitution. A wave of crackdowns on red-light districts took place across the country. But after the police shut down houses of prostitution and arrested prostitutes in cleanup campaigns, vice seemed to resurface. Vice also gave rise to opportunities for police corruption.

In the 1920s and 1930s, crime prevention increasingly became a national issue. Before the 20th century, the criminal justice system operated mostly at the state level. The number of prisoners in federal institutions slowly gained ground compared to the number housed in state prisons. In 1910, there were 66,831 prisoners in the state system,

compared to 1,904 in federal institutions. By 1940, there were 146,325 in state prisons and 19,260 in the federal system.

In 1919, the adoption of the Prohibition Amendment (the Eighteenth Amendment), which made the liquor trade illegal, contributed to the increasing power of the federal government in the criminal justice system. In the same year, the enforcement mechanism to the Prohibition Amendment, the Volstead Act, also was passed. Violating the Volstead Act was a federal crime. As a result, the law put thousands of people in jail across the nation.

With enormous profits to be made in bootlegging and blind pigs (illegal after-hour drinking establishments), organized crime flourished during the Prohibition era. Bootlegging, gambling, and prostitution were part of the underworld culture of organized crime. After 1925 Al Capone, the boss of organized crime in Chicago, ruthlessly murdered his rivals until he went to jail for tax evasion. Ultimately, criminalizing the liquor trade proved to be a failure, and the Prohibition laws were repealed in 1933. Prohibition was unenforceable in a nation that was “dry” in public, but “wet” behind closed doors.

In 1929, crime symbolically became a national issue when President Herbert Hoover stated in his inaugural address, “Crime is increasing.” He proposed a federal commission to study the problem. The result was the National Commission on Law Observance and Enforcement, chaired by George W. Wickersham, a former attorney general in the administration of WILLIAM HOWARD TAFT. In 1931, the Wickersham Commission published 14 reports, studying police behavior, penal institutions, and the causes of crime. It accused the criminal justice system of brutality, corruption, and inefficiency. In the end, the commission’s recommendations collected dust on the shelf, but the commission brought crime to the public’s attention as a national issue. As a member of the Wickersham Commission, Morris Ploscowe had asked whether the state of the criminal justice system suggested that something was wrong in “the very heart of . . . government and social policy in America.” According to legal historian Lawrence Friedman, the role of the federal government in responding to crime increased when the New Deal “sucked power” from the states to deal with the economic crisis of the Great Depression.

**Currency Act (1900)**

The Currency, or Gold Standard, Act of 1900 placed the United States firmly on the gold standard. What may seem to be a trivial event, however, was the result of one of the most turbulent battles in U.S. history. Disputes over currency raged during the final decades of the 19th century. For nearly a hundred years, the United States had used two metals, gold and silver, for coining legal currency. In 1873 this practice changed. Due primarily to the high price of silver, the United States passed a law that made gold the basis of its currency. At first this act drew scant attention. Soon after, however, due to major ore discoveries, silver became more plentiful and less expensive. As a result, American farmers and silver miners called for the coinage of silver. They referred to the Act of 1873 as the "Crime of 1873." In 1878, this pressure led to the issuance of silver certificates, and silver dollars. Many farmers believed that these measures were not sufficient to carry out the business of the country. This argument was especially prevalent in the southern and western states. As borrowers, farmers also were concerned with deflation of the economy and falling agricultural prices. To increase the flow of currency and spur on inflation, they rallied around the call for the free coinage of silver, "Free Silver."

Their pleas were finally recognized when William Jennings Bryan became the presidential nominee for the DEMOCRATIC PARTY in 1896. In Bryan's famous "Cross

of Gold" speech, he stated that "you shall not press down upon the brow of labor this crown of thorns; you shall not crucify mankind upon a cross of gold." His opponent, Republican candidate William McKinley promised to pass a law that would settle the question once and for all. McKinley's supporters believed that gold was the only stable basis for currency, and that the U.S. position in the world economy required that it base its currency on gold. If he were elected, the United States would officially convert to the gold standard.

The sides were clearly drawn, and the election was heated. Bryan was at a significant disadvantage. Businessmen, fearful of many of his policies, foremost of which was his stance on currency, donated unprecedented amounts to the REPUBLICAN PARTY. McKinley spent as much as \$7 million on the election. Bryan had only \$300,000 to spend. The election was a landslide victory for McKinley. He received 271 electoral votes. Bryan received only 176.

As promised, the McKinley administration sponsored the Currency Act of 1900. Its advocates claimed that prosperity followed closely behind the passage of the act, but it had little to do with the new prosperity. New discoveries of gold increased the flow of currency. Gold became even more plentiful than McKinley and his supporters had hoped. Regardless of the policy's merits, gold standard advocates won the battle. As a result, gold remained the standard until the 1970s.

## **Danbury Hatters (*Loewe v. Lawlor*) (1908)**

In the Danbury Hatters case, the United States Supreme Court ruled that a 1902 boycott launched by the United Hatters Union in Danbury, Connecticut, violated the Sherman Antitrust Act of 1890. The labor movement had been gaining strength throughout the 1890s and into the first decade of the 20th century. Union membership grew at a rapid pace, from 447,000 in 1897 to 2 million in 1904. Many employers vigorously resisted this expansion of organized labor. Anti-union employers often went to great lengths to keep their employees unorganized and found numerous allies in courts and legislatures, both at the state and national level.

As the Danbury Hatters case indicates, antiunion employers were frequently able to turn pro-labor legislation against workers and unions. The Sherman Antitrust Act had been enacted in response to growing concerns about the power of large corporations that monopolized entire industries. Employers immediately turned the Sherman Act against workers and unions. They did so by convincing courts and legislatures that unions, strikes, picketing, and boycotts interfered with free trade and prevented competition. Until the CLAYTON ANTITRUST ACT replaced it in 1914, the Sherman Act was invoked frequently to break strikes and undermine the power of labor unions.

When unions found their ability to conduct strikes limited by court injunctions, they increasingly turned to boycotts. Because boycotts were not limited to employees in a specific workplace, they frequently proved more effective than strikes. Confronted by a boycott by all union members in a community, employers often agreed to meet union demands. As the strength of organized labor increased, so too did the opposition of anti-union employers. The NATIONAL ASSOCIATION OF MANUFACTURERS (NAM) helped coordinate the counterattack by hiring strikebreakers, providing spies, keeping lists of labor activists, and financing legal challenges. A related organization,

the American Anti-Boycott Association (AABA), pursued similar goals in court challenges to union boycotts.

When the United Hatters' Union launched its boycott against a company owned by E. W. Loewe, Loewe, with support from the AABA and NAM, took the union to court. The Supreme Court heard the case in 1908 and ruled that boycotts did in fact constitute a violation of the Sherman Act. The ruling required that the union compensate Loewe with triple any damages the boycott may have caused. The ruling, along with other antiunion decisions such as *BUCK'S STOVE*, severely undermined the ability of unions to put pressure on employers, secure union contracts, and organize new union members.

## **Darrow, Clarence Seward (1857–1938) defense attorney, labor activist**

For more than a generation, Clarence Darrow earned a reputation as a champion of organized labor, political radicalism, and progressive reform. A fierce opponent of the death penalty and a supporter of civil liberties, he was the nation's most famous defense attorney between 1905 and 1930. The son of a furniture maker, Darrow was born in Kinsman, Ohio, in 1857. Outspoken, ambitious, and non-conformist, he was profoundly influenced by the political and economic changes that convulsed the country between 1860 and 1880. Darrow studied law at the University of Michigan and passed the Ohio bar in 1878. He spent the next nine years practicing law in Kinsman, Andover, and Ashtabula, Ohio; but the ambitious lawyer was determined to play a larger role.

In 1887 Darrow moved to the bustling metropolis of Chicago. His early activities in the city reflect his determination to establish himself as an influential attorney. Almost immediately upon his arrival, he became involved in efforts to defend anarchists implicated in the Haymarket bombing of 1886. Defending anarchists, however, did not pay well, and Darrow developed close ties with judge and future Illinois governor John Peter Altgeld, who helped him secure a lucrative job as a lawyer for the Chicago and North Western Railway in 1890.

A few years later Darrow quit his job defending the Chicago and North Western Railway to defend EUGENE VICTOR DEBS, the head of the American Railway Union, who had been arrested and convicted on a charge of contempt of court for his part in the Pullman strike in 1894. Though the Supreme Court upheld Debs's conviction, Darrow became famous as an ally of organized labor and a determined defense attorney. He solidified his reputation by defending miners arrested in connection with the 1902 ANTHRACITE COAL STRIKE and WESTERN FEDERATION OF MINERS leader WILLIAM HAYWOOD.

Haywood had been accused of masterminding the 1905 murder of Idaho's Governor Frank Steunenberg. Amidst the chronic violence between western miners and mine operators, the trial received national attention. Some described the case as "the greatest trial of modern time." Idaho's Senator William E. Borah led the prosecution. Each side blatantly attempted to rig the jury, bribe or coerce witnesses, and otherwise influence the outcome of the trial. Darrow's moving 11-hour summation was widely credited for Haywood's surprising acquittal.

Darrow secured his reputation as the great defender with the case of LEOPOLD AND LOEB, the SCOPES TRIAL, and the defense of Ossian Sweet. In 1924, he agreed to defend Nathan Leopold, the 19-year-old son of a millionaire box manufacturer, and Richard Loeb, the 18-year-old son of a former vice president of Sears Roebuck. The two had been accused of murdering 14-year-old Bobby Franks. Faced with overwhelming evidence, Darrow convinced the pair to plead guilty so that he would be able to argue against their execution in front of a judge instead of a jury. The trial has often been called the first modern trial as both sides relied heavily upon psychiatrists and attempted to explain the motivation for the murder. Darrow's 12-hour summation, which is considered a classic legal oration, was filled with poetry and a scathing critique of the death penalty. It convinced Judge John R. Caverly to spare the pair's lives.

In 1925, at the age of 70, Darrow, a long-time member of the AMERICAN CIVIL LIBERTIES UNION (ACLU), agreed to be the lead defense in the Scopes Trial. John Scopes, a high school biology teacher, was accused of violating a Tennessee law barring the teaching of evolu-

tion. The trial highlighted divisions that had developed between religious and cultural modernists and religious fundamentalists. By the time of the trial, those who viewed the theories of Charles Darwin as apostasy had succeeded in getting anti-evolution statutes passed in 15 states. With William Jennings Bryan, a three-time presidential candidate, as the chief attorney for the prosecution and Darrow the lead attorney for the defense, the stage was set for a titanic clash of egos, values, and ideas. The climax of the trial came when he ruthlessly questioned Bryan, who consented to take the witness stand as a biblical scholar, on the literal truth of the Bible. Darrow, who effectively undermined Bryan's credibility and won the public relations battle, convinced the jury to find Scopes guilty, so that the law could be appealed before the Tennessee Supreme Court. While the jury found Scopes guilty and fined him \$100, the ruling was overturned on a technicality.

In a time before radio and television, public speeches and debates were an essential form of communication and a primary means of shaping and influencing public opinion. Through his oratory, Clarence Darrow became a popular hero. His eloquent closing statements were often broad critiques of big business, injustice, the death penalty, and American society in general. From a legal and political perspective, Darrow was extremely effective. In his long career, he never lost a death penalty case; and his closing statements formed a body of political discourse that influenced policy and were closely followed by a captivated public. Darrow was a master attorney and had few equals.

### **Dawes, Charles Gates** (1865–1951) *U.S. vice president*

Born in Marietta, Ohio, in 1865, Charles Gates Dawes established a number of major accomplishments both in the private and public sectors during the course of his life. After completing a bachelor's degree from Marietta College in 1884 at the age of 19, he studied law for two years at the University of Cincinnati. Having been admitted to the bar in his early twenties, he subsequently relocated to Lincoln, Nebraska. Dawes had decided to move to Lincoln not only to practice law, but also to take advantage of its growing economic opportunities.

Calvin Coolidge and Charles G. Dawes (on the right) (*Library of Congress*)

While in Lincoln, Dawes began to amass a small fortune that he used to purchase, starting in 1894, some 28 gas and electric plants across the United States. Having further expanded his economic well-being with these gas and electric plants, he founded the Central Trust Company of Illinois—often referred to as the “Dawes Bank”—in 1902. Dawes served as president of this financial operation until 1917 when he enlisted in the United States Army. During his 26 months of active duty, Charles Dawes went from the rank of major to brigadier general. His primary responsibil-

ity as a member of General Pershing’s central staff during WORLD WAR I was to devise and implement an effective supply procurement and distribution system. During congressional hearings following the war, Dawes earned the nickname of “Hell and Maria” for his blunt response to allegations that the army had been charged excessive prices in France for draft animals to move supplies to the front. Accordingly, Dawes exclaimed, “Helen Maria, I’d have paid horse prices for sheep if the sheep could have pulled artillery to the front!”

Despite facing stiff opposition from fellow members of the Republican Party, Charles Dawes supported President WOODROW WILSON’s efforts to secure congressional approval of the TREATY OF VERSAILLES and U.S. membership in the newly formed LEAGUE OF NATIONS. Despite his support for Wilson’s treaty, Harding appointed Dawes director of the newly created Office of the Budget.

Using the principles of efficiency that he had honed while serving as the chief officer for procurement and distribution of supplies to the AMERICAN EXPEDITIONARY FORCE during World War I, Charles Dawes committed himself to the task of reforming budgetary procedures for the government of the United States during the early 1920s. Under his leadership, each department of the federal government now had to prepare a true budget that projected future expenditures and was expected to stay within those budget projections. It is estimated that the budget reform implemented by Dawes saved the U.S. government some \$2 billion annually during the early part of the 1920s. Dawes’s growing reputation for efficiency and fiscal management ultimately led the League of Nations in 1923 to appoint him chair of an international committee to deal with the question of German war reparations, which Germany no longer could afford to pay, creating much instability in the international economy. The final report issued by the Dawes commission provided facts on Germany’s budget and resources, outlined measures needed to stabilize the currency, and suggested a new schedule for meeting the payments due the international community as reparations for the war.

Because of his work on the German reparations issue, Charles Gates Dawes was named the corecipient of the 1925 Nobel Peace Prize. Dawes donated the prize money to Johns Hopkins University to establish the Walter Hines Page School of International Relations. Charles Gates Dawes reached the pinnacle of his public life in 1924 when he was elected vice president of the United States. He served in this capacity during Calvin Coolidge’s administration from 1925 to 1929.

**Dawes Plan** (1924)

Because the U.S. ability to trade with Europe was compromised with the outbreak of war in 1914, the restoration of international trade became a major focus of recovery efforts following the cessation of hostilities in 1918. Prior to the onset of WORLD WAR I, the United States imported more goods from Europe than it had exported to the European continent. The destructive nature of the war severely crippled the European economy—both in terms of infrastructure and the availability of labor. Before the war U.S. citizens owed some \$3 billion to Europeans. After the war, European citizens owed private Americans \$3 billion and their governments owed another \$10 billion. Wartime loans from the United States to Europe constituted the primary source of this capital imbalance.

Complicating the ability of European nations to repay these loans to the United States was the reparations that Germany owed to the international community as a result of the TREATY OF VERSAILLES in 1918. Ravaged by war, the French wanted to cripple Germany at the Peace Conference. Accordingly, the French along with the British included in the final treaty a “war guilt clause” that held Germany directly responsible for damages caused by the war. To determine the amount of reparations, the Versailles Treaty established a commission to make a specific dollar amount recommendation. In 1921, the Reparations Commission concluded that the German nation, which also had been ravaged by the war, owed the international community \$33 billion.

The repercussions of this extensive bill undermined international economic relations for more than a decade. The international trade system depended on the flow of capital between nations to maintain at least a semblance of equitable trade relations between nations. European nations, which owed the United States some \$13 billion, relied on U.S. investments and the sale of goods to raise the capital for repayment of these loans. In addition, the reparation payments from Germany served as a critical source of capital for loan repayments.

Given the extensive payments by the Reparations Commission forced on Germany in 1921, the German government soon found itself increasingly unable to make the necessary payments to the international community. By 1922–23, Germany defaulted on its payments. As reparations further eroded the German economy, other European nations were left without the necessary infusion of capital to meet their loan repayments to the United States. As a result, Great Britain began calling upon the United States to cancel the debts that they owed the American government and private banks. Great Britain argued that the United States should write off these loans and consider them part of their contribution to the Allied victory over Germany.

With the international economy in jeopardy, the U.S. government reevaluated the issue of German reparations. Accordingly, in 1924, under the auspices of the U.S. Department of State, CHARLES GATES DAWES was sent to Germany to discuss their economy and to devise a means for the government better to meet its international obligations under the Treaty of Versailles. The resulting Dawes Plan sharply reduced German reparations from \$542 million to \$250 million annually and renegotiated the schedule for the payment of these monies. Dawes also devised a systematic program to promote direct capital investment in the German economy by such leading U.S. financial institutions as the J. P. Morgan Company. Despite the revised schedule of payments, the Dawes Plan proved to be a superficial solution. The European economy could not bear the heavy weight of both loan repayments and reparations. Similarly, the U.S. economy could not provide enough capital to keep the European economy afloat. Reparations and debt issues contributed to the structural weaknesses in the world economy that led to the economic crash of the 1930s.

**Debs, Eugene Victor** (1855–1926) *socialist leader, labor activist*

Eugene V. Debs was one of the most prominent and effective socialist politicians and labor organizers of the late 19th and early 20th centuries. Born in Terre Haute, Indiana, in 1855, Debs left home at an early age and took a job at a local railroad as a locomotive fireman and quickly joined the Brotherhood of Locomotive Firemen. By 1880, Debs had become the secretary-treasurer of the national brotherhood. From this early involvement with organized labor, Debs became convinced that American capitalism and industry exploited workers, created a wealthy elite, and threatened to undermine traditional midwestern values.

Initially, Debs attempted to work within the political system to push for reform. In the early 1880s, he joined the DEMOCRATIC PARTY, winning election to the Indiana state legislature in 1884. Despite this brief foray into mainstream party politics, Debs continued to focus his efforts on organizing railroad workers. In 1893 he became president of the nation's largest union, the American Railway Union (ARU). Debs was immediately thrust into the national spotlight as he led the ARU in several railroad strikes between 1894 and 1895. In 1894 the ARU conducted a successful strike against the Great Northern Railroad and launched a similar strike against the Pullman Palace Car Company

in May 1894. The Pullman Company had reduced wages by 25 percent in reaction to the Panic of 1893 and in the spring of 1894 refused to negotiate with the ARU. When the company refused to agree to arbitration, the Chicago ARU local voted to walk off the job.

Debs called for a national boycott of the Pullman Company, and sympathy strikes spread to 27 states, but he also rebuffed those in the ARU and the larger labor movement who advocated a general strike that would bring Chicago to a standstill. When violence broke out in Chicago and elsewhere, George Pullman called on Illinois's progressive governor, John Peter Altgeld, to employ the state militia to restore order and break the strike. When Altgeld refused, President Grover Cleveland and Attorney General Richard Olney ordered 2,500 federal troops to take control of the situation and charged Debs with violation of the Sherman Antitrust Act (1890). The intervention of federal troops not only ended the strike, but also led to the destruction of the ARU when in 1895 Debs was sentenced to a six-month prison sentence for contempt of court.

Caricature of Eugene Debs, pictured wearing a crown labeled "Debs' American railway union" (Library of Congress)

Federal intervention and the final outcome of the Pullman strike convinced Debs that those who had advocated expanding labor politics into a larger class struggle had been correct and that Progressive and Democratic Party calls for gradual reform were doomed to failure. While in prison, Debs spent considerable time reading the works of Karl Marx and shortly after joined the recently formed Social Democratic Party (SDP). Debs assumed the post of secretary-treasurer of the SDP and attempted to reconcile differences between the SDP and the Socialist Labor Party, playing an instrumental role in merging the two factions into the Socialist Party of America (SPA). Debs also played a leading role in mobilizing the left wing of the labor movement between 1900 and 1920, helping to form the INDUSTRIAL WORKERS OF THE WORLD in 1905. As head of the Socialist Party, Debs ran for the presidency in 1900, 1904, 1908, 1912, and 1920. Although he received only 96,000 votes in 1900, by 1904 the SPA had become the largest third party in the country. That year Debs received more than 400,000 votes and tallied 897,000 votes in 1912.

When war broke out in Europe in 1914, Debs and the SPA opposed American intervention and warned the public against American involvement. When Congress and President Woodrow Wilson declared war against the Central Powers on April 6, 1917, Debs reiterated his opposition to the war. Wartime legislation, specifically the ESPIONAGE ACT of 1917 and the SEDITION ACT of 1918, made it illegal to criticize the American government and its involvement in the war. Debs, however, continued to criticize Wilson and the war effort. Following a speech in Canton, Ohio, Debs was arrested and charged with sedition. After a short trial, he was convicted, sentenced to a 10-year prison term. His prison term did not diminish his popularity among socialist voters. When Debs ran for the presidency in 1920 from his cell in the Atlanta Federal Penitentiary, he received almost 1 million votes. Nevertheless, the SPA and the socialist movement in general lost ground during the Red Scare of 1919–21. Debs was released from prison in 1921 and died five years later in 1926.

## Democratic Party

One of the two national political parties between 1900 and 1930, the Democratic Party frequently found itself the minority party. It won the presidency only twice in the first

three decades of the 20th century. The party had even less success in Congress, controlling the House of Representatives from 1911 to 1919 and the Senate only from 1913 to 1919. The primary reason that the Democratic Party failed to achieve greater political success was that for much of this period the party was deeply divided and lacked an effective national agenda. In the decades after the American Civil War, the Democratic Party had most of its support located in the rural Midwest, South, and West. It opposed strong central government and state intervention in the economy and local matters, like education. It distrusted the eastern financial and business elites. As the nation became increasingly urban and ethnically diverse, the Democratic Party made important inroads with urban immigrants and Catholics. In the 1890s, the Democratic Party achieved political success by attracting the support of struggling farmers and radical reformers, who had given rise to the Populists, and by addressing the concerns of urban immigrants. These agendas were not, however, compatible.

The Panic of 1893 and the ensuing depression marked an important turning point in the party's fortunes. As more and more rural farmers found themselves facing bankruptcy, radical agrarian organizations gained strength. The Democratic Party responded to the challenge from the Populists by reiterating its opposition to the business elite, resisting protective trade tariffs, and supporting cheap money policies. These themes culminated in the presidential election of 1896 and helped ensure that the party remained out of national power until 1912. In that election, William Jennings Bryan won the Democratic presidential nomination with his moving "cross of gold" speech, in which he blamed the depression of 1893 and the economic difficulties of ordinary workers and farmers on bankers and industrialists. Wherever Bryan went on the campaign trail, he drew large and enthusiastic audiences. Under the direction of McKinley and party leader Mark Hanna, the REPUBLICAN PARTY secured the support of business and financial leaders and raised and spent much more money than did the Democrats. The Democratic Party was also divided over Bryan's monetary policy and his attitude toward organized labor. These divisions in the party and Bryan's focus on agrarian issues dampened enthusiasm among urban immigrants and industrial workers and led to McKinley's narrow victory.

At the national level, Bryan maintained his control over the party until the election of 1912. He was the party's presidential candidate in 1900 and again in 1908, suffering decisive defeats each time. The presence of Bryan at the head of the national ticket alienated many of the party's urban immigrants and Catholics, who were growing in numbers and influence. In many large cities in the East and Midwest, the Democratic Party had established a dominant presence. Party leaders rewarded loyal party supporters with jobs or city contracts. In return, party

leaders demanded political loyalty. Long-standing political machines controlled the party and its patronage jobs in New York, Chicago, Boston, Detroit, and elsewhere.

Success at the state and local level did not translate into success at the national level until 1912. In 1911 Democrats, capitalizing on the unpopularity of Republican president WILLIAM HOWARD TAFT, took control of the House of Representatives for the first time since 1895. Taft had alienated important elements in his own party and was viewed as indecisive and ineffective. The Democratic nominee was little-known New Jersey governor WOODROW WILSON. When progressive Republicans, led by ROBERT LA FOLLETTE and THEODORE ROOSEVELT, broke ranks with Taft and formed the PROGRESSIVE PARTY, the Democratic party took advantage. Wilson won the election easily.

Strong leadership and the passage of a number of progressive reforms marked Wilson's first term in office. Progressives in both parties had been attempting to pass reform legislation for more than a decade only to have it blocked by the conservative Speaker of the House JOSEPH GURNEY CANNON. With progressive Democrats in control of both the presidency and Congress, the Wilson administration addressed the concerns of organized labor with the CLAYTON ANTITRUST ACT (1914), the ADAMSON ACT (1915), and the child labor KEATING-OWEN ACT (1916). Between 1912 and American entry into WORLD WAR I in 1917, the Wilson administration developed a cordial relationship with the AMERICAN FEDERATION OF LABOR (AFL). Democrats also created a FEDERAL INCOME TAX and passed the FEDERAL RESERVE ACT (1913) to oversee the nation's banking industry and the FEDERAL TRADE COMMISSION ACT (1914) to oversee business practices.

The outbreak of World War I presented Wilson and the Democratic Party with important questions and challenges. The country had a long-standing tradition of NEUTRALITY. Wilson, who strongly supported England and France, publicly insisted that the United States would remain neutral in the conflict while he privately worked to ensure the defeat of Germany. During the election of 1916, Wilson promised to keep the country out of war and narrowly defeated Republican nominee CHARLES EVANS HUGHES. When German submarines resumed attacking American ships carrying supplies to Great Britain, however, Congress declared war on April 6, 1917.

At war's end, Wilson hoped to use the power of the United States to ensure a lasting peace. In January 1918, he announced a "fourteen point" peace plan. He was determined to bring about a workable peace agreement that would not be excessively harsh on Germany. In order to do so, he decided to attend the Paris Peace Conference personally and spent seven months in exhausting negotiations. The British, French, and Italians all had committed and lost significant resources in the conduct of the war and

insisted that Germany make financial and territorial reparations. Wilson finally relented and the final peace agreement, known as the TREATY OF VERSAILLES, was signed in June 1919. Wilson hoped that the creation of the LEAGUE OF NATIONS would counterbalance punitive measures of the treaty. Once back in the United States, the exhausted Wilson submitted the treaty to Congress for approval. Congressional Republicans, led by Senator HENRY CABOT LODGE, worried that American involvement in the League of Nations would entangle the country in foreign affairs. Wilson embarked on a cross-country tour to promote the treaty, but the effort proved too exhausting; on October 2, 1919, he suffered a massive stroke. While recovering, Wilson refused to compromise with Lodge and other Republicans, and the treaty was defeated when it failed to get the necessary two-thirds support.

By 1919, the Democratic Party was losing strength. The Republicans had taken back the House and the Senate in the elections of 1918, and Wilson's lingering disability meant a lack of leadership at the head of the party. Following the end of the war, the economy went into a tailspin. A strike wave broke as workers, frustrated by rising inflation and liberated from wartime pledges not to strike, demanded pay increases. Wilson's attorney general, A. MITCHELL PALMER, had become convinced that labor unions and political radicals posed a serious threat and met their resistance with his own counterattack, a series of raids in which labor militants and radicals were arrested and held without bail. Later, they were either released or deported. The RED SCARE alienated labor support from the Democratic Party.

The defeat of the Versailles Treaty and the Red Scare of 1919–21 enabled the Republican Party to regain the presidency in 1920 with the election of WARREN GAMALIEL HARDING, who promised to return the nation to normalcy. In the elections of 1920 and 1924, the Democratic Party revealed that the cultural and social issues that had begun to divide it in the early 20th century had come to a head. In both elections, the issues of PROHIBITION, evolution, the legacy of the Wilson administration, and the KU KLUX KLAN split the convention votes over platform and candidate. Unenthusiastically, the party nominated nondescript businessmen to run against similarly bland Republicans. Throughout the 1920s, the Republican Party relied upon close ties with business leaders, conservative economic policies, and a prolonged economic boom to dominate the national political scene. In 1928, the candidacy of ALFRED E. SMITH signaled a sea change in Democratic Party fortunes. While he lost the presidency, the party showed surprising strength among ethnic voters in northern urban strongholds. The new Democratic base, drawing on the support of labor, ethnic voters, Catholics, and the new middle class, grew as the economy worsened

in the late 1920s. While it retained much of its southern rural constituency, a new factor was the growing number of African-American voters who began to shift their loyalties to the Democratic Party after being disaffected by Republican policies. Despite these trends, the Democratic Party controlled neither the presidency nor the Congress until its return to power when Franklin Delano Roosevelt was elected in 1932.

### Dempsey, William Harrison "Jack" (1895–1983) *heavyweight boxing champion*

Jack Dempsey, one of the most dominant and charismatic boxers in American history, held the heavyweight championship between 1919 and 1926. Dempsey emerged on the boxing scene just as the sport was reaching the peak of its popularity. One of 11 children, Dempsey was born in Manassa, Colorado, in June 1895. He got involved in boxing at an early age. Absolutely ruthless in the ring, he generated great strength from his legs and packed an incredibly powerful punch. As a result, Dempsey was the most feared and successful boxer of his generation, compiling a record of 60 wins, 50 by knockout, with only six losses.

By the 1920s the United States was still convulsed with economic fluctuations, labor disputes, and the Red Scare. Many yearned for nonpolitical distractions, and sports—professional boxing in particular—fit the bill. Because boxing was still developing as a sport and few fighters had professional managers, Dempsey had a difficult time finding boxers who were willing to take him on. He bounced around from one mining community to another, fighting as often as he could. Dempsey's professional career finally took off when he met Jack "Doc" Kearns, who became his manager. Dempsey and Kearns decided it was time to hit the big time, and the pair moved to New York, where Dempsey handily defeated all the top heavyweight title contenders.

Dempsey finally got a shot at the heavyweight title in 1919 in a bout with reigning champ Jess Willard. Willard, near the end of his career, was not in top shape. When he saw the "Manassa Mauler," he told his wife he was afraid he would not survive the fight. Dempsey showed Willard no mercy, knocking him down seven times in the first round and fracturing his jaw. As heavyweight champ, Dempsey

Jack Dempsey in the ring, ca. 1921 (Library of Congress)

found few opponents willing to challenge him. He had no title fights in 1924 or 1925. Dempsey finally lost his title belt in 1926 when challenger Gene Tunney defeated him. The following year, Tunney agreed to a rematch. Before a huge crowd, Tunney was again defeating the challenger on points when Dempsey knocked him to the canvas. Instead of beginning the 10-count right away, the referee waited until Dempsey had retreated to a neutral corner, giving the champ an extra four to five seconds. “The long count,” as it became known, allowed Tunney time enough to recover, and he went on to win the controversial bout on points.

Although others have had a longer reign as heavyweight champion, Dempsey’s impact is hard to exaggerate. Dempsey realized the importance of self-promotion. His boxing exploits were captured on film and shown to audiences across the country, giving him the kind of exposure no other fighter had ever enjoyed. Part of Dempsey’s popularity was due to the desire of many white boxing fans for a great white champion. Jess Willard’s victory over African-American heavyweight champion JACK JOHNSON had remained controversial. When the untainted, handsome, rugged, and gregarious Dempsey arrived on the

scene, he was, for many white boxing fans, the right kind of champion.

As champion, Dempsey helped popularize the sport. Prior to the 1920s, professional prizefights had a small but loyal following. With his arrival, the sport’s popularity expanded to the point that a crowd of 105,000 saw Dempsey’s 1927 rematch with Gene Tunney, and the fight generated a purse of \$2.6 million. Dempsey’s popularity continued well after the end of his boxing career, and he was not bashful about exploiting it for political purposes. During the 1930s, Dempsey was an ardent New Dealer and made numerous campaign appearances on behalf of Franklin Delano Roosevelt and other Democrats.

### **Dewey, John** (1859–1952) *education reformer*

An educator and philosopher, John Dewey was best known as America’s preeminent philosopher of education and founder of pragmatic philosophy. He placed his greatest efforts into convincing Americans that ethics could be directly applied to life in the new industrial world. Dewey argued that the survival of democracy depended on the application of philosophical ethics to everyday life. It was in his attempts to relate his philosophy to education that he made his greatest impact.

Dewey was born and raised in Burlington, Vermont. He graduated from the University of Vermont in 1879 and afterward worked as a teacher for two years. He then enrolled in graduate school at Johns Hopkins University in Baltimore to study philosophy. After earning his doctorate in 1884, Dewey went to teach at the University of Michigan, where he remained until 1894. It was during his time in Michigan that he developed his interest in using philosophy to solve social problems. There he also met his wife, Alice Chipman, whom he married in 1886. In 1894, Dewey took a job at the University of Chicago. It was there that he developed his belief that philosophy should be empirically based and socially concerned. This pragmatic philosophy attempted to connect philosophy to everyday issues.

Dewey came to believe that the consequences of his philosophy would best be revealed in education. To test his theories, Dewey established a school called the Laboratory School. He also published his first book on education, *The School and Society*, in which he laid out his philosophy of what role education should play in a democratic society. He wrote that each school should function as a community that

reflects the larger society and trains children into membership in that society. Once the schools accomplished that by instilling students with a “spirit of service and providing him with the instruments of effective self-direction, we shall have the deepest and best guarantee of a larger society that is worthy, lovely, and harmonious.”

In 1904, Dewey joined the faculty at Columbia University, where he remained for the rest of his career. During his years at Columbia, he became publicly known. He wrote several books elaborating his philosophical argument that ethics was not a separate domain from everyday life, but should be manifest in social, political, and economic issues. In 1916, he published *Democracy and Education*, in which he laid out his conception that democracy was not just a political system but also a form of social life that required educated citizens. His conception of education differed from other educational philosophers. Education was a social process, Dewey argued, that nurtured the social, intellectual, and aesthetic growth of individuals, which then led to the renewal of society. Because of the importance that education held for their futures, democratic societies required an education that would nurture in individuals social relationships and control, while fostering social change without disorder.

On a practical level, Dewey urged educators to create schools that taught schoolchildren how to be individual actors in a democracy. Because a democracy required that each individual make decisions, education should, argued Dewey, train students in scientific inquiry. An important component of his proposed curriculum was the education of the whole individual through instruction in both intellectual and manual subjects. The purpose of this was to give all students, regardless of their future occupation, an appreciation of the skills on which the new industrial society depended. Dewey argued that this type of education would flow naturally with children’s natural curiosity and sense of wonder. In order for students to have the opportunity to develop decision-making abilities, he argued that the schools must be reformed as democratic communities in which students are allowed to make decisions on their own and create their own knowledge. Students would do this by engaging in ongoing communication, experimentation, and self-criticism, which they would undertake in student-centered instruction through small-group work and project activities.

Dewey’s educational plans formed the basis of many of the educational reforms that emerged during the Progressive Era. Many of his reforms were not implemented as he had intended. Proponents of vocational education, for example, used his call for training in both manual and intellectual subjects to justify educating some students solely in vocational subjects. In addition, many teachers used small-group work as an addition to their regular teaching

as rather than making it the core. Whether his philosophy was accepted whole-cloth, partially, or rejected all together, Dewey shaped the debate in American education that continues today.

## Dillingham Commission

In the Progressive Era, increasing immigration and fear of foreign nationals led Congress to create the Dillingham Commission to investigate current trends and recommend changes in immigration law. Through much of the 19th century, the United States had an “open door” immigration policy that allowed individuals and families from Europe to enter the country with relatively few restrictions. As the economy of the United States became more concentrated in urban areas and focused on industrial production, the volume of migrants to America steadily increased. The growing congregation of immigrants in urban centers quickly became an issue of much concern. As a result, it gave rise to a vocal anti-immigrant movement by the end of the 19th century. Although Congress enacted legislation that restricted the ability of Chinese immigrants to enter the United States in 1882, immigrants from areas other than China and Asia faced few restrictions in migrating to the United States before the outbreak of the European war in 1914. With a liberal immigration policy and steady improvements in transatlantic transportation, European migrants were able to reach the United States in ever-increasing numbers and from a wider range of areas between the 1880s and the war. In 1882 some 788,922 immigrants entered the United States, and 1,285,349 in 1907. The countries of origin dramatically shifted as well. Although there was little immigration from eastern and southern Europe in the 19th century, by 1907 these countries combined sent nearly 75 percent of the immigrants who arrived in the United States.

As the United States witnessed major economic changes during the last quarter of the century, immigrants often became the scapegoat for the rapid changes taking place in American society. The vocal anti-immigrant sentiments of this time period ultimately pushed Congress to appoint the so-called Dillingham Commission to investigate immigration-related issues. Headed by Senator William P. Dillingham of Vermont, a moderate restrictionist, the committee ultimately issued a 42-volume report that played on the fears held by the growing anti-immigrant faction in the United States. Despite drawing alarming

conclusions about the effects of immigration on American society, the evidence amassed by immigration officials across the United States did not support the arguments of Senator Dillingham and his fellow committee members about the need for immigration restrictions. The committee argued in its report that the so-called new immigrants were racially inferior to the old immigrants from northern and western Europe. Manipulating statistical data on these “new” immigrants, the Dillingham Commission provided a “scientific” argument calling for legislation to restrict their entry to the United States. In essence, the Commission’s contention that the “new” immigrants from southern and eastern Europe were incapable of becoming Americans found a welcome audience in the United States, especially as hostilities in Europe broke out and calls for “Americanization” of immigrants reemerged. The passage of the IMMIGRATION ACT OF 1917 was only the first in a series of increasingly restrictive immigration policies, culminating in the 1924 Immigration Act, which Congress adopted in response to the Dillingham Commission’s recommendation to close the immigration door, especially for immigrants from Asia, Africa, and southern and eastern Europe.

### direct election of senators (Seventeenth Amendment) (1913)

Reform movements in the late 19th and early 20th centuries had as a primary goal the expansion of democracy in the political system. Shifting the power to elect senators from state legislatures to the voting population was one of the most important means of democratizing the system. In an era of concentrated wealth and political power, money played a large role in determining both who was elected to political office and in how the government acted. For many progressives, the symbol of the corrupting influence of money in government was the United States Senate. Indeed, they pointed to the Senate’s loss of public esteem as a result of how the Senate seemed to operate both as a “rich man’s club” and as an obstacle to political reform. In 1906, David Graham Phillips, a muckraking journalist, published a series of essays in *The Treason of the Senate*, which exposed corruption and bribery in the Senate chambers. Between 1900 and 1910, three senators were indicted for accepting bribes, and 12 more faced charges of corruption. The reform press saw the Senate increasingly as an “obstructive, spoils-seeking, courtesy-bound, corporation-fed” group.

The chief problem, reformers argued, was that the Constitution had given the authority to select senators to state legislatures, where Senate seats were, some said, “a matter of purchase.” In 1907, Senator Simon Guggenheim admitted that he had received his Senate seat by contributing to the political campaigns of Republican members of the Colorado legislature. There was a groundswell of popular support for the passage of an amendment for the direct election of senators. By 1912, the House of Representatives had already considered an amendment five times, but each time the Senate blocked the amendment. In 1912, when the issue was raised again in the wake of the Senate expulsion of William Lorimer, a Chicago political boss, for vote-buying, 29 states already had moved to elect senators by popular vote. WOODROW WILSON, then governor of New Jersey, had earned public respect for blocking the appointment of a political boss to the Senate, and Franklin Delano Roosevelt gained political visibility when he led insurgents against the appointment of a Tammany candidate to the Senate. Faced with this new political climate, the Senate passed the resolution for what would become the Seventeenth Amendment, for the direct election of senators. The required number of states ratified the amendment in 1913, and it became law in the 1914 election year.

The struggle to pass an amendment for the popular election of senators was only one of a series of political reforms central to PROGRESSIVISM. In seeking greater political access for ordinary people, progressive reformers and politicians sought to expand the franchise in a rational manner (the extension of the vote to women) and to grant to ordinary citizens the powers of initiative and referendum, which enabled direct legislation; recall, to make representatives and judges more responsive to popular opinion; and the direct primary, a means of dismantling the power of party bosses in the electoral process. These later reforms, unlike woman suffrage and popular Senate elections, were not adopted into the Constitution. They remained in the province of progressive state politicians. By 1914, 12 states, all of them west of the Mississippi, had adopted some form of direct democracy. None of the democratic reforms, however, changed the way in which the Senate or politicians fundamentally did business. The Senate has remained for most of the 20th century a governmental body with a disproportionate number of wealthy members, and direct primaries did not stop political party bosses from working the backrooms of conventions to ensure their candidates’ success.

## dollar diplomacy

In what was later called *dollar diplomacy*, the U.S. government attempted to control the finances of nations in Latin America and Asia to protect U.S. business interests. Under dollar diplomacy, American administrations applied economic intervention in order to prevent military intervention. As proponents of policy in the WILLIAM HOWARD TAFT administration said, it used dollars instead of bullets.

President Taft was not as interested in international relations as his predecessor, THEODORE ROOSEVELT. Taft's secretary of state, Philander C. Knox, worked hard, however, to promote the economic interests of the United States overseas. Although the previous administration had made an agreement with Japan in 1905 to limit its involvement in Manchuria, the Taft administration aggressively sought to increase American economic interests in the region. Knox worked to include the United States in a group of Western powers attempting to build railroads in China. When the European powers agreed to the consortium, the United States tried to exclude the Japanese from the construction of railroads in Manchuria. The railroad building project then collapsed when Japan formed an alliance with Russia.

The Taft-Knox foreign policy in the Caribbean was a continuation of Roosevelt's policy in the region. The Taft administration sought to keep the European powers out of the region at the same time that it expanded American influence. Under the policies of dollar diplomacy, the Taft administration attempted to replace European investments with investments from the United States.

Taft and Knox were not unwilling to turn to military intervention when financial backing was not enough. The Taft administration sent troops to Nicaragua to support the insurgents when a revolution broke out in 1909. The U.S. troops seized the customs houses until peace was restored. Then Knox increased the economic influence of the United States in the country by encouraging American bankers to provide loans to the insurgent government. Taft sent troops to Nicaragua again two years later when an insurrection broke out. This time, they stayed for over a decade.

## dress

In the early decades of the 20th century, American society attached great significance to the clothes people wore. As

new fashions and styles of clothing emerged, debate over their effect on the social and moral order also arose. Americans believed that morality was communal; therefore, what one wore was a public expression bound up with the moral order of the community. Changes in clothing styles could be seen as a threat to the moral order. Debates over dress occupied a significant place in American society because styles were changing tremendously throughout the first three decades of the century.

Before the turn of the century, only wealthy women had the ability to purchase new clothes often enough to make changing styles possible. Most Americans either made their own clothes, bought rough, ready-made clothing, or had their clothes made by a tailor. Ordinary people tried to make each item of clothing last as long as possible. In the late 19th and early 20th centuries, the availability of better-styled ready-to-wear clothing changed this practice. Ready-to-wear refers to clothing made in large quantities in different sizes, just as it does today. The economies of scale realized in making large numbers of women's shirtwaists, for example, allowed the manufacturers to sell them at a price that women could afford. It became possible, therefore, for women of all social backgrounds to wear new styles of clothing.

The opportunity to wear the latest fashions meant a great deal to many men and women, especially immigrants. Many immigrants used their clothing to express their identity as Americans. They were no longer forced to maintain the dress of their native land, but they could instead dress like any other American. Some critics argued that the availability of ready-to-wear clothing convinced the lower classes to buy clothes for the purpose of appearing above their station in life. Despite lower prices, many working-class men and women could not afford the new styles, and their desire to own new clothes had a negative effect on their economic situation.

The most significant shifts in clothing were twofold. First, the women's ready-made clothing industry developed the shirtwaist, a tailored blouse tucked into a skirt. The shirtwaist allowed women to change their dress more frequently and to vary the color and style of their blouses. It also gave to a new generation of working women a professional look. The parallel development for men was the soft collar shirt. In the 19th century, detachable starched cloth and paper collars gave businessmen a formal look, while working men were more often seen in a working man's blouse or shirt with a soft collar. Better fabric and a soft collar democratized men's clothing.

Some of the most strident debates occurred over women's clothing. Changes in women's clothing styles actually began as a health crusade at the end of the 19th century. Dress reformers argued that dresses that reached the

ground gathered all sorts of dirt and germs as they swept along city streets. Women's dresses also contained numerous creases and folds of heavy material that trapped dirt and disease. Reformers also demonstrated that the weight of women's clothing made it difficult for women to carry out many everyday activities. Partially in an attempt to improve health, clothing designers began to raise the hemlines of women's dresses and use less material. The changes caused considerable debate. Critics argued that the new styles symbolized a moral collapse as women's ankles became visible and fashion became overly important to many American women. Shorter hemlines also touched off a debate about femininity, as many argued that rising hemlines threatened women's special place as the moral center of society.

By the mid-1920s, fashion had emerged as a powerful force in opposition to community morality. Hemlines that had risen to the knee in the early 1920s came back down, but not because of moral outrage. Hemlines were simply following fashion. Americans had not yet accepted that fashion should be used to express their individuality, but the groundwork was laid for the role that fashion would come to play in American culture.

**DuBois, W. E. B. (William Edward Burghardt DuBois)**  
(1868–1963) *scholar, writer, civil rights activist*

A writer and sociologist, DuBois was a leader in the African-American struggle for racial equality and social justice. Although his political and social views evolved over time, DuBois consistently struggled to win access to America's economic riches and political rights for African Americans. He is perhaps best known for his dispute with Booker T. Washington over the proper strategy for winning civil rights. In this dispute, DuBois rejected Washington's conservative policies and argued that confrontational strategies were needed. The height of his influence came in the years stretching from 1909 to 1934 when he used his position as editor of the *Crisis*, the journal of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE, to further the African-American civil rights struggle.

DuBois was born in Great Barrington, Massachusetts. He graduated from Fisk University and went on to do graduate work at Harvard and the University of Berlin. In 1895 he became the first African American to earn his doctorate from Harvard and wrote his doctoral dissertation, which was later published as *Suppression of the African Slave Trade in the United States, 1638–1870* (1896). After teaching at Wilberforce College and the University of

Pennsylvania he became professor of history and economics at Atlanta University, where he conducted many important sociological studies of African-American life. In 1899, he published his influential *The Philadelphia Negro*, and a series of studies thereafter.

DuBois's political and social ideals evolved throughout his life. He initially accepted Booker T. Washington's conservative strategies, agreeing with Washington that African Americans could embrace self-help and community development and temporarily temper their demands for political and civil rights. During his early career DuBois also argued that African Americans were distinct from white Americans and therefore should seek the development of separate identities and cultures within the same society. However, as southern states enacted Jim Crow laws and disenfranchised black voters, DuBois began to distance himself from the philosophy of Washington. In his 1903 work, *The Souls of Black Folk*, DuBois attacked Washington over his strategy in regard to education, suffrage, civil rights, and the African-American relationship with the South.

By this time, DuBois had decided that African Americans needed “a talented tenth” to lead the struggle for civil rights. Washington's brand of industrial education, DuBois argued, would never produce an educated leadership. He also argued, in repudiation of Washington, that African Americans should fight for immediate political and civil rights. Only through immediate and militant action could African Americans force white Americans to change. In adopting this position, DuBois rejected Washington's belief that the future of African Americans lay in the South. DuBois argued that the Jim Crow South was not changing, and therefore African Americans should move, if necessary, in their struggle for equal rights. In making these arguments, DuBois distanced himself both from Washington and from his earlier thought. He firmly rejected SEGREGATION and the development of separate cultures that he had earlier embraced.

In 1905 DuBois helped create a practical outlet for his philosophy by helping to found the NIAGARA MOVEMENT. In opposition to the more moderate course of Booker T. Washington, the Niagara Movement espoused direct protests and demanded immediate civil and political rights. Washington used the influence he had built up through the Tuskegee Institute and his connections with white philanthropists to oppose the new direction of civil rights activism. By 1911 the Niagara Movement had failed. However, many of its leaders, including DuBois, became founding members of the NAACP.

During his time in the NAACP, DuBois had his greatest influence on American racial issues and politics. In 1909, he quit his job at Atlanta University and moved to New York City to work full-time for the new civil rights organization. The NAACP succeeded where the Niagara Movement had failed. Largely due to its biracial composition,

W. E. B. DuBois (Library of Congress)

it was immune to Washington's ability to restrict the flow of funds from white donors to African-American organizations. DuBois founded *The Crisis*, the NAACP's monthly journal, and used it to espouse his ideas on the issues of the day. From 1910 until he resigned as editor in 1934, DuBois used *The Crisis* to push a militant civil rights agenda focused on political agitation. Although he was often at odds with more conservative members of the NAACP, he managed to keep control of the content of *The Crisis* throughout most of his tenure.

During his time as editor, DuBois's political and social ideals continued to evolve. He often found himself in opposition to other African-American leaders in the 1920s. On

the one hand, he drew fire from more conservative NAACP leaders who did not support his militant ideals. On the other hand, he faced opposition from other African-American leaders who did not believe he was militant enough. By the early 1920s, DuBois had come to believe that socialism offered a political choice for African Americans. However, because he embraced a moderate evolutionary socialism, he came under attack from African-American leaders who believed that a more radical brand of socialism or communism offered African Americans more. DuBois also became interested in Pan-Africanism, a movement that sought to unify Africans and people of African descent worldwide, but he faced opposition from MARCUS GARVEY and his UNIVERSAL NEGRO IMPROVEMENT ASSOCIATION.

By the end of the 1920s, DuBois had embraced Marxism as the answer to the African-American struggle. Because racism was based in maintaining the African Americans as a permanent lower class, DuBois argued, the answer to their plight was the overthrow of the capitalist economic system and all classes. Surprisingly, his interest in Pan-Africanism led him back to supporting segregation as a strategy for improving the lives of African Americans. DuBois argued that segregated schools and hospitals were better than no schools and hospitals. This rejection of the NAACP's ideal of integration and his turn to radical politics alienated him even further from the NAACP leadership; in 1934 he resigned from the organization he had helped create. For the rest of his life, he continued to write and struggle for the rights of African Americans, but he never again achieved the prominence he enjoyed during his years with the NAACP. DuBois died in self-imposed exile in Ghana after joining the Communist Party and renouncing his U.S. citizenship.

### economy

The years from 1900 to 1930 witnessed the maturing of the United States as an industrial and financial power. The growth of BUSINESS at home and abroad, the merger movement of the early 20th century, and banking and financial reform, as shown in the CURRENCY ACT of 1900 and the passage of the FEDERAL RESERVE ACT (1913), contributed to the ascendancy of American economic power. During these decades, the United States changed from a debtor nation, which imported and borrowed more from nations than it exported, to a creditor nation, to which many European nations owed both war debts and peace loans. The United States took the lead in the production of steel, oil, and automobiles, which rapidly supplanted the older industries of iron, coal, and rail as the leading sectors of the world economy.

Foreign trade and foreign investment grew substantially through these years, as the United States expanded into new markets. Latin America, Mexico, and the Caribbean long had been the destination of American agricultural commodities and manufactured goods. After the turn of the century, tentative steps toward developing a market in Asia and the expansion of trade with Canada and Europe shifted the balance of trade in America's favor, especially after WORLD WAR I. This also stabilized the U.S. dollar. Protective tariffs continued to play a role in fostering American industry and protecting its agriculture. The restrictive trade policy of the United States and its high tariffs, however, undermined the health of the world economy as a whole.

For most of its history, the well-being of the United States has hinged on the state of its farm economy. The turn of the century witnessed the "golden age" of AGRICULTURE, as farm producers grew and sold a large share of the world's agricultural exports, especially in wheat, cattle, and cotton. From 1900 to 1920, the value of cultivated land and agricultural crops increased by nearly 400 percent, as prices soared to 300 percent of their 1900

value. Trends toward more intensive farming and use of scientific farming methods, however, slowed the growth of improved land. As part of a trend toward more scientific methods, new agricultural colleges sprung up, which taught young farmers to keep books, count costs, and calculate profit and loss. Farm agents in newly developed Agricultural Extension services pushed farmers toward scientific livestock raising, the use of alfalfa, rust-resistant wheat, and expanded egg and poultry, milk, sugar, and citrus fruit production. The gas engine tractor also replaced earlier equipment. These changes increased the value of crops and livestock produced from \$4,717,000,000 in 1899 to \$19,331,000,000 in 1917. The agricultural labor force remained about the same size, or 11 million laborers, despite expanded production.

By the 20th century, manufacturing dominated the nation's economy and surpassed in value the agricultural sector. A slight decline in food exports between 1900 and 1913 was more than compensated for by iron and steel manufacture, which was surpassed only by raw cotton in the value of its exports. Refined copper and copper products, refined mineral oils, lumber, timber, and wood products, cars and carriages, cotton goods, and agricultural implements topped the list of goods exported. After 1897, there was a great increase in foreign trade, despite the prohibitively large tariffs instituted in the late 19th century (especially the Dingley Tariff of 1897). After 1889, the United States achieved a positive trade balance, as both agricultural and manufacturing goods came to represent a larger proportion of the nation's economy. Industry led the way. By 1913, manufactured goods constituted 48.8 percent of all exports, in contrast to 35.3 percent of trade in 1900. Europe declined as a destination for American-made goods. In 1900, Europe received 75 percent of all U.S. exports. By 1917, this had declined, despite the need for war matériel, to two-thirds. In 1919, after the war had ended, Europe received only 40 percent of all American exports, while U.S. exports to Canada and Asia doubled.

The war in Europe intensified these trends. Arms and munitions, chemicals, and transport vehicles, as well as cotton and wool textiles, oil and coal, and foodstuffs were exported to Europe in ever-growing quantities as the conflict wore on. Unable to continue domestic food production and in desperate need of war material, combatant nations considered natural allies of the United States—Britain, France, and Italy—increased their demand for such goods, driving up domestic prices, wages, and profits. A British blockade did obstruct trade with Germany, Austria, and their allies, but these had never been major markets for American goods. With the U.S. declaration of war in April 1917, the need for the production of arms, munitions, and other war matériel further increased. For the first time, the United States produced its own high-grade textiles and chemicals, two products that had a profound effect on the postwar domestic economy. Finally, the war forced the United States to build its own merchant marine and import directly from source countries, rather than using European brokers.

The United States emerged from World War I as the only major power with a stable economy. War and its consequences weakened European economies at the same time it strengthened the industries and finances of the United States. New markets were opened to American agricultural and financial goods, and more importantly, American businesses capitalized on strengths they had developed over decades. Corporate managers reorganized and merged businesses. New technology, hiring policies, and improved management led to greater efficiency and growth in worker productivity. The prosperity of the postwar years was rooted in the boom in industrial production. The Gross National Product (GNP) rose from \$85.1 billion in 1923 to \$103 billion in 1929. Income from such sources as payrolls, pensions, dividends, and profits grew from \$74.2 billion in 1923 to \$89 billion in 1928. Corporate income increased nearly 25 percent, from \$8 to \$10 billion. Savings, building and loan assets, insurance assets, and stock holdings all increased, as did total wages.

The cornerstone of this prosperity was the **AUTOMOBILE INDUSTRY**, which was growing in size, influence, and wealth. The most famous of the manufacturers, and the one whose name became synonymous with **MASS PRODUCTION** and the assembly line, was **HENRY FORD**. His efforts to “get prices down to buying power” transformed the auto industry as he streamlined car production, and his “Five Dollar Day,” which boosted the wages of skilled workers in his employ, gave Ford much of the publicity he needed to maintain a stable labor force. His sales and profits soared, as they did among all automobile companies.

Originally a highly competitive industry with a wide range of producers, the auto industry in the 1920s featured some of the most dramatic mergers. William C. Durant, a

carriage manufacturer, took over the Buick Motor Car Company in 1905. By 1908, with loans from the Dupont Company, Durant had combined a number of small companies into General Motors (GM), soon “the greatest industrial corporation in the world.” By 1920, when he was forced out as company president, Durant had managed to take over 40 percent of the domestic automobile market. In 1923, Walter P. Chrysler, head of production at GM, resigned to buy and reorganize the Maxwell Motor Company, renamed the Chrysler Corporation. By 1928, Chrysler bought Dodge Brothers and formed a corporation to rival Ford and GM. Within a year, the “Big Three” automakers were producing 83 percent of all automobiles.

The automobile and the assembly line were only two outward symbols of industrial expansion and prosperity. The making of automobiles required other industrial products: steel, glass, leather, chemical paints, and textiles in car manufacture; rubber for tires; oil refining for gasoline; and the construction of new roads. In the 1920s alone, more than a billion dollars was spent on highway construction and nearly half a billion on city streets. In the wake of the automobile boom, the number of car sales agents, filling stations, garages, motor homes, tourist motels, restaurants, and attractions also grew rapidly. With the widespread use of the automobile came the further expansion of cities and a boom in building construction. Apartment buildings, houses, factory and commercial construction, new schools, churches, and hospitals were the product of the suburbanization encouraged by the automobile. Innovations in electrical manufacturing and communications triggered a remarkable increase in domestic goods. These industries (radio, electric light, phonograph, telephone, and furniture, among others) expanded domestic markets and turned over high rates of profit in the prosperous years of the 1920s.

The key to much of the success in corporate profits was the growth of productivity. Since the turn of the century, corporations had used the ideas of **FREDERICK WINSLOW TAYLOR** to streamline work processes. Managers used time-and-motion study to simplify human action in the workplace for greater efficiency. They centralized decision making about production, personnel, and distribution. In addition, **INVENTION AND TECHNOLOGY** had a tremendous impact. By 1928, the Committee on Economic Trends reported that the nation’s per capita productivity had increased in eight years by 35 percent.

Increased productivity and profits, expanding markets, and the use of consumer credit made possible new corporate consolidations and mergers. Following the pattern of the automobile industry, almost every sector of the economy witnessed this phenomenon. Over the course of the 1920s, more than 8,000 businesses disappeared, captured by corporate takeovers. Banks, utility companies, and retail stores led the way. In banking, merger mania and

the development of branch, or chain, banks, aided industry concentration. In 1920, there were 1,280 branch banks; a decade later, there were over 3,500. In 1919 alone there were 80 bank mergers; in 1927, there were 259. From 1919 to 1924, utility companies consolidated into huge regional conglomerates. More than 3,700 local companies vanished as 10 holding companies controlled 72 percent of all power. What was true in manufacturing and power was equally true of wholesale and retail businesses. Chain stores, like chain banks, sprang up all over the nation, forcing out smaller family-owned grocery markets and ethnic food stores. Large chains such as Atlantic and Pacific Tea (A&P) soon dominated the retail food market, growing from 400 stores in 1912 to over 15,000 in 1932. In 1918, there were 29,000 chain retail stores; by 1929, they had increased to 160,000, including drugstores, grocery stores, and clothing stores.

Through the course of the First World War, the United States moved from being a debtor to a creditor nation. Both the U.S. government and private investors lent combatant nations more than \$10 billion for the war effort and reconstruction. In addition, private lending and postwar trade imbalances shifted from a nearly \$3 billion deficit to a more than \$3 billion surplus. The response to this shift, however, was not to lower tariff barriers and encourage trade but to resurrect the higher customs duties and protect American goods. In 1922, under the influence of business and farm LOBBYING AND INTEREST GROUPS, Congress passed the FORDNEY-MCCUMBER TARIFF, which restored prewar taxes on imports.

Trade and economic ties with other countries spurred economic growth at home and internationally. The war had already increased the U.S. presence abroad. In the years that followed, the United States increased its dominance of the world economy as it took its products, branch businesses, and investment capital abroad. American products, such as wheat, corn, steel, and automobiles, found new foreign markets. In mass communications too, American motion pictures, cable, radio, news services, and advertising dominated the market. As some observed, America's "economic miracle" in the 1920s was based on access to consumer goods, mass production, and easy credit at home and abroad.

Trade was further supported by American finance and investment abroad. The Federal Reserve Act of 1913 provided the legal basis for branch banks in other countries. The demand for capital was so strong that by 1920 there were over 180 foreign branches and affiliates of American banks. Capital followed, as businesses increased their stake from an estimated \$3.8 billion in 1919 to \$7.5 billion in 1929. Market-oriented Ford, General Motors, and International Business Machines increased their investments in foreign countries. There was new emphasis as well

on developing raw materials. Before the war, the United States had primarily exported resources from its domestic stores. During the 1920s, American corporations developed a global strategy in acquiring raw materials and mineral sources in other countries. Oil corporations expanded into Mexico, Venezuela, and Colombia. Rubber companies turned Liberia into an American protectorate. American mining corporations like the Anaconda Company, Union Carbide, and the Guggenheim Brothers exploited deposits of copper, zinc, manganese, chrome, nitrates, and other minerals in Latin America.

Another area of U.S. involvement was the increasing availability of loans to stimulate development abroad. To aid in postwar reconstruction under the DAWES PLAN of 1924, the United States arranged to lend \$100 million to Germany and scaled down war reparations to ease its financial burden. From 1924 to 1929, German banks and corporations borrowed from 50 to 80 percent of their capital loans from American banks. At the same time, British and French war debts limited their ability to seek credit from the United States, a cycle that figured prominently in the world economic crisis of the 1930s.

The 1920s is often characterized as a decade of economic rebirth and widespread prosperity. But higher productivity and national income did not help certain industries and regions, which suffered severe economic depression. By 1920, the wartime prosperity in agriculture had evaporated in the postwar international economy. During the war, farmers took on new debt in response to an expanding market both at home and abroad. European nations had been hungry for American wheat, corn, and cotton. Farmers mortgaged property to expand their acreage, equipment, and production. As battlefields were returned to peacetime agriculture, the international market collapsed. American farm products had to compete with Argentinian and Canadian wheat and beef, Egyptian cotton, and European foodstuffs.

The decline in the farm economy was precipitous and severe. Farm income dropped over 50 percent from 1919 to 1921. More than 13 million acres were abandoned in the first decrease in land tilled in American history. Farm bankruptcies skyrocketed. In 1905, farm bankruptcies were only 1.5 per 10,000 farmers; in 1920, that figure had soared to 20 per 10,000. The total number of bankrupt farms amounted to 453,000 over the course of the decade. Agricultural commodity prices were to blame. In 1920, the price of the leading 10 crops declined by 57 percent; in 1921, they were one-third of the prices in the previous year. The loss of family farms due to debt and bankruptcy reinforced the trend toward corporate farming.

In their experience of the 1920s as a decade of decline, farmers were not alone. As one historian wrote, "Hundreds of thousands of workers did improve their standard of

living in the 1920s, but inequality grew.” Real wages stagnated over the course of the decade, and there was a great disparity of income among workers as new industries like automobile and electrical manufacturing benefited and older industries like coal and textiles experienced declining wages and unemployment. These factors contributed to the economic crisis of the 1930s.

## education

The modern educational system in the United States took shape during the period from 1900 to 1930. As part of the Progressive reaction to the growth of cities, the effects of industrial society, and the new immigration, educators reformed school curricula from kindergarten to universities. They created the modern school system, in which the state mandates schooling to a certain age and education beyond elementary schools is tracked according to assumptions about a student's future occupation. The ideas of JOHN DEWEY, which emphasized learning through practical application, were influential in the emerging education reform. Most importantly, American universities became the site for the production of knowledge and training of experts.

The educators who reformed the schools during the first three decades of the 20th century were reacting to social, economic, and cultural changes in American society. In the eyes of many reformers, American society had begun to disintegrate due to the pressures brought to bear by modern industry, mass immigration, and rapid urbanization. In response, reformers embraced the doctrine of efficiency as the means for saving American society. Social efficiency was the belief that all the different parts of society could be formed into an efficient functioning whole. Educators believed that they could use the schools to prepare each student for his or her place in society, thus making America socially efficient and ending the threat to the social order. These beliefs steered educators as they modernized schools during the early part of the century.

Although school systems chose to modernize in different ways, the educational changes across the country shared certain characteristics. First, educators extended schooling to include a much larger proportion of children. Second, schools expanded and differentiated their curricula. Third, educators sought to use the schools to solve

social and economic problems. Fourth, schools sought to individualize the school program. Educational institutions from grade school to the university based their modernization efforts on these principles.

During this period, the most significant change in American schools was the tremendous increase in the number of students attending school, particularly high school. Between 1900 and 1930, the proportion of 14- to 17-year-olds enrolled in high school grew from 10.6 percent to 54.9 percent. Total enrollment increased almost 700 percent. In comparison, the total population of 14- to 17-year-olds increased by just over 50 percent. The increase in high school enrollment far outstripped the growth of the high school-aged population. The percentage of 17-year-olds who graduated from high school increased from 6.4 percent in 1900 to 32.1 percent in 1930. A variety of factors contributed to these increases. The most significant were compulsory education laws and the fact that high school education had become more valuable.

State legislatures across the United States passed compulsory education laws in reaction to changes occurring in the economy. By the 20th century, the apprentice system for learning a trade was all but nonexistent. In addition, many of the jobs in large factories that dominated American industry did not offer opportunities for advancement. Educators feared that the young men and women entering factory work faced a life of toil without the hope of advancing to better-paid positions. Educators also feared that the immigrants streaming into the United States would not adopt American ways and values if they did not receive an education. To counteract these threats, educators undertook efforts to bring more children into school. Compulsory education laws were favorite tools in their efforts. Most states passed compulsory education laws in the late 19th century and expanded the targeted ages early in the 20th century. By the end of the first decade, many states had passed laws that mandated education up to at least 14 years of age. Many of these laws exempted youths aged 15 and 16 only if they proved that they could read and write at a satisfactory level.

High school also became more valuable as a path to a career. Many large manufacturers began to require a high school education for new employees. High schools also began to offer practical courses that prepared students for jobs immediately upon graduation. These changes helped increase the high school enrollments throughout the country by making high school beneficial for a larger number of teenagers.

The growth in the number of high school students changed the methodology of education. Prior to the 20th century, schools focused on teaching basic literacy and arithmetic at the grade school level. High schools offered courses of study targeted toward preparing students for

Four African-American women participate in a cooking class. (*Library of Congress*)

college. Students who did not fit the system stayed out of school. Any child who completed elementary school and was not interested in college would drop out. Children who were unable to complete the regular courses in the elementary schools because of physical or mental handicaps did not attend schools. Educators thought that children leaving school early was a threat to society. Because they had placed themselves at the center of a healthy social order, educators moved to expand their offerings to attract more students. They did this by differentiating the curriculum to appeal to the widest range of students.

In all grade levels, educators created programs for students unable to complete the regular course of study, including students who were deaf, blind, developmentally disabled, delinquent, gifted, anemic, and suffering from tuberculosis. In the high schools, educators first differentiated the curriculum in their effort to meet the needs of students who attended school only because they were

required to attend. At the turn of the century, America's high school students could choose from two to five courses of study, in which most of the classes were required. Educators felt that the influx of a group of students who were not interested in the courses of study offered would disrupt regular classes. They were compelled, however, to offer all students an education. Schools, therefore, set up special classes. The problem arose of what to teach in these classes. Teachers eventually settled on a course of manual training, in which the schools would teach the students basic manual skills that might help them once they left school. As compulsory education laws forced more students into high school, educators expanded these programs.

From its beginning, manual training developed into vocational education. Initially, schools expanded manual training to make education more practical for all students. At the same time, educators realized that many youths were leaving public school to enter private business schools,

which taught skills such as stenography and bookkeeping. To attract these students, schools began to teach business skills. Educators soon applied the same model to appeal to students who left school as soon as legally possible to work in industry. Manual training courses evolved into vocational education. Schools began to offer courses in trades such as bricklaying, painting, dressmaking, and automobile mechanics.

Educators' belief in vocational education led them to differentiate the curriculum by sex. Because female students faced restrictions in the labor force, educators saw it as socially wasteful to offer them training in all fields. Thus, educators introduced vocational courses in dressmaking, millinery, retail selling, and domestic science. Restricting students to specific courses was a change from the 19th-century system in which all students could select their course of study. The differentiation by sex in vocational education spread to other areas of the curriculum, leading to further discrimination against female students.

From these beginnings, vocational education came to define the American high school as general education, while college preparation curricula also assumed students' vocational paths. Many vocational education proponents, however, began to discern a problem with the educational system. School systems realized that many students were so far below grade level that they never reached high school before they turned 16, at which time they could legally leave school. The danger in this, according to school officials, was that these were the students most in need of vocational training. Schools reacted in two ways. They created junior high schools and instituted INTELLIGENCE TESTS.

The idea behind junior high schools was that the oldest grades of elementary schools would be separated and provided with the same type of differentiated curriculum offered at the high schools. Students who planned on continuing through high school took academic courses while those students who never intended to go to high school studied vocational subjects. School officials believed that this served the needs of all students equally.

Intelligence testing also worked to keep students at the grade level deemed appropriate for their age. The tests were first extensively used by the U.S. Army in WORLD WAR I. America's schools adopted them immediately after the war. By the mid-1920s, the school systems of 37 out of the 40 largest cities used intelligence testing to place students in instructional tracks. Many school systems gave students intelligence tests as early as first grade and assigned them to instructional tracks based on the results. Instruction was then differentiated between the tracks. Students who received the lowest scores were taught basic literacy and vocational skills while those who scored the highest were offered an education that prepared them for high school. By matching instruction to the perceived intel-

ligence of the students, the schools hoped that all students could pass to the next grade level each year. However, there were problems built into the tests. Intelligence testing was in its infancy, and tests were biased in favor of native English-speaking students. Thus, across the country, foreign-born students were placed in the lower instructional tracks in a much greater proportion than their percentage in the population as a whole. Fortunately, most schools realized these problems; and by the 1930s they decreased their reliance on intelligence tests.

The separation of students into tracks remained an integral part of the schools. Coupled with the continued belief in social efficiency, tracking led to the abandonment of a broad, meaningful education for large numbers of American students by the late 1920s, as schools struggled to offer education to an ever-increasing student body. They discovered that, beyond a certain point, education ceased to offer vocational value for students who planned to work in factories. The schools' goals for these students became simply to pass them from grade to grade without expecting much from them. The general track, as it was known in many school systems, failed to challenge students. It offered grade promotion in return for good behavior in school. Students were not expected to demonstrate mastery of any subject beyond the basics.

America's colleges and universities went through changes similar to those of its secondary schools. In seeking to modernize, colleges first sought to make themselves the center for the production and dissemination of knowledge. Second, they promoted the use of scientific knowledge to improve agriculture and industry and to address economic and social problems in collaboration with government and business interests. Third, colleges expanded their programs in an effort to spread knowledge to as many people as possible.

Much in the same way as high schools, colleges in the 19th century had offered limited courses of study. As society and the economy became more complex, college presidents began to see a need for a more complex curriculum. They realized that the experts needed in the industrial economy would need to be trained at the universities. Professionals such as chemists, physicists, social workers, engineers, and lawyers required training. America's colleges and universities developed specialized curricula to meet these needs. In order to teach these new subjects, university faculty members had to become experts themselves. Faculty thus began to undertake research as part of their roles as educators. It was the beginning of the university as an important site for scientific, economic, and social research.

Many other professions were beginning to require education past high school, but not four years at a university. Outside of the university, new post-secondary educational institutions emerged. Normal schools for teacher training,

business schools, and nursing schools arose to meet the needs of newly specialized professions. In addition to the training offered to students pursuing a definite occupation, colleges began to offer classes to students not necessarily interested in a degree. Many college presidents believed that the knowledge being discovered by university faculty should be spread. Colleges developed classes and lecture tours that reached out to interested citizens not enrolled in a university.

The knowledge gained through research was not used solely for instructing new students. University faculty began to work with government and private organizations to help solve problems. Agricultural colleges developed new crops, fertilizers, and farming techniques to help farmers, and also extension programs. University social work programs undertook studies on which government and private agencies based their policies. Finally, new professional schools of education emerged to reinforce progressive reforms and to further modernize school systems. Collaboration between universities and other agencies became an important component of the modern educational system.

## elections

The political culture of the late 19th century gave a central place to the ritual of election campaigns. Torchlight parades and party picnics were the occasion for fiery partisan oratory, and elections took on the aura of great battles between the Grand Old Party (Republicans) and the Dinner Pail Brigade (Democrats). By 1920, however, POLITICS had been transformed. A critical realignment in 1896 made the REPUBLICAN PARTY the majority party in both the White House and Congress, and the competitiveness that characterized elections evaporated. High levels of voter participation declined, as the old battleground states of Ohio, Indiana, New York, Connecticut, and, to a lesser extent, New Jersey and Pennsylvania became rock-solid Republican. As the minority, the DEMOCRATIC PARTY relied on its strength in the South and the rural Midwest.

There were other changes as well. The ratification of the Nineteenth Amendment (1920) for WOMAN SUFFRAGE gave the vote to women. In many respects, however, voting and electoral politics were of declining significance. The initiative for legislation came increasingly from LOBBYING AND INTEREST GROUPS, and the center of political gravity shifted from local party politics to mass democracy. At the same time, elections—at least national presidential elections—remained the central drama of American political life.

After 1900, several political reforms—new voting regulations, early registration, residency requirements, and stricter enforcement of voting laws—changed who was defined as a citizen and a voter. More independent voters and declining party loyalty increased such practices as split-ticket voting (where individuals voted for candidates of more than one party) and the use of pasters (stickers with independent candidates' names). Initiative, referendum, and recall and the direct primary changed how politicians and party officials did business, as did the increasing levels of campaign funding required by improvements in communication and in how party campaigns were conducted. Fear of the power of immigrant political machines encouraged an URBAN REFORM movement, which worked to shift power away from ward organizations to central government. The introduction of citywide elections and the shift toward city commissions undermined ward-level politics. By the 1920s, the spate of laws restricting immigration also diminished the importance of the immigrant and ethnic vote.

The expansion of the right to vote to women ironically helped to lower voter participation rates. In 1920, for example, the rate had fallen to 53 percent. Following declines in party identification, fewer voters voted. What was more, newly enfranchised women were not voting in the same proportion as men. Women did not vote as a bloc as many opponents of suffrage had feared. Rather, women seemed to have as many political opinions and as varied political interests as men. Their presence as voters—and later as candidates for political office—was deemed negligible. The changing composition of the American electorate, from the new women voters to the naturalized citizens and second-generation ethnic children, eventually caused a realignment in the two major political parties that brought about Democratic dominance of the federal government in the 1930s.

Before 1930, however, the mainstream political parties had little to distinguish them in terms of issues. For the Republicans, monetary policy, especially establishing the Gold Standard for the dollar and support for high protective tariffs, dominated their platform. Democrats stood against the enhancement of federal power and for a greater voice for the people in politics. Both parties endorsed the sanctity of property rights and the virtues of democracy.

The sameness in their platforms sparked dissent in the creation of third-party candidacies. Throughout the period from 1900 to 1930, third-party activity on the local and state levels allowed the election of socialist and farmer-labor aldermen, mayors, state representatives, and members of Congress. In successive elections of 1912, 1916, and 1920, socialist EUGENE VICTOR DEBS received increasing support from voters disenchanted with the business-oriented politics of the Republican and Democratic Parties. The Progressive Republicans' revolt against the "Old Guard" gave rise to the PROGRESSIVE PARTY campaigns of 1912 and 1924. Throughout the period, the Prohibition Party also ran national campaigns dedicated to building a consensus for state control of alcohol and eventual passage of the Eighteenth Amendment, which instituted national PROHIBITION.

In 1900, the election of William McKinley to a second term in office was a confirmation of fundamental shifts in party loyalty in the late 19th century. The previous elec-

tion had been a critical one, in which party support shifted and the Republicans became the majority party in Congress and the White House. The Democratic Party, which was divided between a solid South and uneven support in the rural Midwest, lost critical ground by nominating Bryan again. His support for Free Silver (inflation through monetary policy) alienated urban voters from both the working class and the middle class. The Republicans had for their platform a consistent emphasis on the Gold Standard for money and a high protective tariff. Besting for a second time Democrat William Jennings Bryan, McKinley benefited from a large campaign fund and a well-orchestrated political campaign under Republican businessman Mark Hanna. McKinley won the election by a margin of 7,218,491 to Bryan's 6,356,734.

With the assassination of McKinley in 1901, THEODORE ROOSEVELT assumed office. When he campaigned for office in his own right in 1904, his popularity among voters buoyed him against his opponent, the Democratic

Theodore Roosevelt at the first Progressive Party convention in Chicago, Illinois, 1912 (*Library of Congress*)

candidate, corporate lawyer Alton B. Parker. Not only was Roosevelt better known and liked, but also he was the incumbent. His boisterous campaign to regulate trusts and his support for healthy government-business relations gave him an edge with both sides of the class divide. Roosevelt won the election 7,628,461 votes to Parker's 5,084,223. The electoral vote was even more decisive, with Roosevelt winning 336 to Parker's 140.

Custom prevented Roosevelt from running for his second full term, since he had already served nearly eight years in the White House. The Republican Party still controlled crucial states, and it continued to have majority strength, so eventually Roosevelt gave the go-ahead to WILLIAM HOWARD TAFT, his handpicked successor, to run for the presidency on the Republican Party ticket. In that campaign year, 1908, Bryan once again stood as Democratic candidate for the White House. His conservative populism played well in the rural South and Midwest, but it did not convince the majority of voters. Taft, running a low-key and conservative campaign, won the election handily, 7,675,320 votes to Bryan's 6,412,294. Socialist Debs, on this third campaign for the presidency, won more than 420,000 votes.

In 1912, tensions within the Republican Party, and the renewed ambition of former president Theodore Roosevelt, helped spark the creation of the Progressive (or Bull Moose) Party. By this time, there were clear divisions among Republicans. Opposition to Taft and to the Old Guard in Congress under JOSEPH GURNEY CANNON prompted the creation of a National Progressive Republican League under ROBERT LA FOLLETTE. In the election campaign, there was a strong contrast between reform politics aimed at bolstering the federal government power, idealized under the rubric of Roosevelt's NEW NATIONALISM, and the more competition-centered, small business language of the NEW FREEDOM under WOODROW WILSON. Running as the incumbent, Taft spent most of his attention and fire on the Progressive Party. While Roosevelt continued to have a grasp on the public's loyalty and imagination and outpolled Taft, Woodrow Wilson won the election. The split between Progressive voters and Republican stalwarts opened the door for the Democrats to take the White House for the first time since the election of 1892.

Woodrow Wilson's presidency confirmed that a Democratic Congress had overcome the obstacles to reform. In the first four years of his presidency, Wilson used Democratic majorities in the House and Senate to pass several important pieces of legislation, including the child labor KEATING-OWEN ACT, the ADAMSON ACT, the FEDERAL RESERVE ACT, and the UNDERWOOD-SIMMONS TARIFF, which finally lowered the high protective tariff rates of Republican administrations. In 1916, running against Wilson, Republican CHARLES EVANS HUGHES tried to mobi-

lize the discontent with the reforms from both Republicans and Democrats. As incumbent, however, Wilson held the edge, and the Republican Party still suffered from its earlier split. Wilson narrowly defeated Hughes, riding on his pledge to keep the country out of WORLD WAR I. With a margin of 9,127,695 votes to Hughes' 8,533,507, Wilson was reelected.

Changes in the electorate were not at first noticed during the Republican ascendancy of the 1920s. Republican politicians followed the call of their presidential candidate, Senator WARREN GAMALIEL HARDING of Ohio, for a "politics of normalcy." As the "best available man," he became the party's candidate in preference to other reforming politicians. His opponent, Ohio politician James Cox, similarly won the Democratic Party nomination by defeating the politics of reform within the party. Such Wilson administration stalwarts as Attorney General A. MITCHELL PALMER and William McAdoo, the president's son-in-law, lost out in the struggle to find a consensus candidate. Winning the election by a nearly two to one margin in popular votes (16,143,407 votes to 9,130,328), Harding became president not so much because voters rejected reform in general as because they refused to endorse the particular reforms that had dominated American politics since Wilson's election in 1912.

Harding's death and the subsequent presidency of CALVIN COOLIDGE distanced the Republican Party from charges of corruption and graft, and in 1924, he ran for president in his own right against an opposition split between a new farmer-labor alliance and a Democratic Party with a divided constituency. Ever since the election of 1896, the Democrats had kept a balance between urban immigrant voters and their larger national base among rural and southern voters. By 1924, the strain of trying to keep together the party was beginning to show. Democratic voters and politicians were divided over the KU KLUX KLAN, Prohibition, and FOREIGN POLICY. The Klan, which had become powerful in local and state governments across the nation, was the object of an anti-Klan resolution in the party convention. For every state, which, like New York and Minnesota, had passed anti-Klan laws, however, there were other states where Klan members held major political offices. The chief contestants for the Democratic nomination were on opposite sides of the issue. William McAdoo, a politician with strong rural and southern ties, an advocate of Prohibition and supporter of the Klan, ran for the nomination against ALFRED E. SMITH, governor of New York, allied with Tammany Hall, and an opponent of both the Klan and Prohibition. More than 100 ballots were needed to decide the Democratic candidate for president—John W. Davis, a conservative Wall Street lawyer. Davis had neither strong ties to the Wilson administration nor did he represent the urban/rural divide within the party.

Discontent over politics as usual helped spark a third-party political campaign in 1924. A coalition of socialists, trade unionists, farm advocates, and progressives created a Progressive Party ticket. Robert La Follette, whose achievements as a reforming senator gave him national fame, agreed to be the party's presidential candidate. Burton Wheeler, who had gained notoriety as the chief investigator of the Harding administration, became the vice presidential candidate. The controversial role of the Communist League in the party and divisions among progressive voters weakened the party's chances in the election. Calvin Coolidge was elected president, winning 15.7 million votes to 8.4 million for Democrat John Davis. Third-party candidate La Follette received 4.8 million votes.

The elections of Harding, Coolidge, and later Herbert Hoover were in many ways emblematic of a political system at a standstill. Republican Party politics went no further than arguing for, in Harding's words, "Less government in business and more business in government." The positive legacy of the Harding administration was a reorganized and streamlined federal bureaucracy. Coolidge, Harding's successor, had a similar eye toward the limited scope of government. Unaddressed problems of race, poverty, and the relation between government and the economy lay beneath the surface of the politics of normalcy.

By 1928, the strains of the political system began to show. Coolidge, who had support for a second term, withdrew from the race early, leaving the Republicans to nominate stalwart Herbert Hoover for the presidency. Hoover had served in both Democratic and Republican administrations, but most notably as secretary of commerce under Harding and Coolidge. A former engineer, Hoover was committed to the same principles of rational and efficient government. Like many Republicans, however, he believed that the country should rely on the market to stabilize the economy and address inequality.

For urban voters, an increasingly important segment of the voting population, the candidacy of Herbert Hoover, a staid midwesterner associated with business interests, was just more of the same. Instead, they found their interests represented in the candidacy of Democrat Alfred E. Smith. A Catholic, urban politician, and a "wet" (anti-Prohibitionist) to boot, Smith garnered the votes of urban working-class and white voters. A realignment of northern cities away from the Republican and into the Democratic Party column was a sign of a different politics in the making. But during an election year characterized by anti-Catholicism and a strong Prohibitionist vote, Smith could not make headway against Hoover. Hoover won the election by a landslide of 21 million votes to Smith's 15 million (444 electoral votes to Smith's 87). The election of Hoover was the last stand for the politics of normalcy. The onset of the Great Depression brought with it realignment in party

politics and a permanent shift in how elections would be conducted in the future.

## electricity

Electricity, long an object of curiosity and wonder, became a major source of power and technological innovation in the late 19th and early 20th centuries. Daily life in the home, in the streets, and in shops and factories was directly affected by the new inventions of URBAN TRANSPORTATION, lighting, heating, and mechanization, all fueled by electricity, a source of power that was largely more efficient, cheaper, safer, and more versatile than the technologies it replaced. At the same time, the creation and utilization of electricity also could have negative effects on the environments of city and countryside. Hydroelectric power was relatively clean; and coal-generated electricity removed coal from the direct environment of home and factory, but it still polluted urban air and poisoned water and land in mining districts. Electrical mechanization of factories made workers more productive but also contributed to technological unemployment, and electric appliances lessened some forms of domestic work on the one hand and raised expectations for cleanliness on the other.

Electrification of urban transport was one of the earliest changes in the 20th-century United States. Substituting electrified wire or track for oil- and coal-driven engines, streetcar companies were able to realize profits from greater speed in transit, fewer repairs, and greater efficiency as well as the sale of surplus energy to private utility companies. The electric trolley transformed cities by making suburban areas more accessible, and many streetcar companies were able to cash in on the sale of real estate along its lines and operation of amusement parks at the end of its lines. Public lighting also changed the urban landscape.

The perfecting of an efficient alternating current (a.c.) motor in 1910 had made possible the creation of a range of electrically powered industrial machinery and domestic appliances. First to take advantage of the cheap cost, broad applicability, and increased availability of electrical power were manufacturers, who turned toward the electrification of machinery in most major consumer industries. Electrical machines that helped produce canned goods and

Charging the battery of a Detroit electric automobile (*Library of Congress*)

meat products, cigarettes, wheat flour, and milk were all introduced in the period. On the whole, it was the versatility of electric engines that enabled their use in industry to expand that rapidly. Electric motors could drive a full range of small motors and large ones, link machines through belts and wires, and regulate the process through gauges and meters. For that reason, electric motors replaced coal- and oil-driven engines and thus increased speed and efficiency and lowered production costs. In 1905, motors powered by electricity accounted for less than 10 percent of industrial production. By 1930, they accounted for 80 percent of all manufacturing output. American consumption of electrical power increased as dramatically as its uses. Between 1899 and 1919, the use of electric power increased from 1.8 percent of industrial production in 1899 to 31.7 percent.

Within private households, electricity worked a revolution in domestic work. First, the proportion of residential homes wired for electricity increased dramatically in the

first three decades of the century. In 1907, only 8 percent of households were electrified. By 1920, this figure had increased to 34.7 percent. By 1930, nearly 70 percent of all households were wired for electricity. Following on these developments, the invention and adoption of such appliances as electric fans, refrigerators, sewing machines, washing machines, toasters, mixers, and vacuums reshaped the labor of women who worked within the home and increased the amount of time spent on laundry, cooking, and cleaning. The availability of electricity also allowed for the wider adoption of RADIO for entertainment and news. Once limited to crystal sets, new radios ran on the same electricity as other household appliances. Standardization of wiring and equipment meant that electricity also was cheap.

The electrical industry grew over the course of the 1920s. Utility companies, which were increasingly subject to government regulation, continued to grow in revenue and assets, as they provided one of the most important

sources of power in cities. While rural areas remained outside the power grid, rural electrification was only a decade away. The manufacture of electrical appliances, in particular, electric motors, lights, radios, and phonographs, became a major industrial sector in the 1920s, and its workers were among the better paid industrial workers. While still a mass production industry, the increased demand for new electrical goods guaranteed employment for its workforce, at least while the economy remained relatively prosperous. Even with the advent of the Great Depression in 1929, electrical manufacturing and the electrification of the home and workplace continued, almost uninterrupted, at the pace of the 1920s.

### Elkins Act (1903)

The Elkins Act was one of two important Progressive Era laws that provided for the federal regulation of railroads. Antitrust reformers lobbied the government to rein in what they saw as unfair rate-fixing practices by railroad companies. When THEODORE ROOSEVELT became president after William McKinley was assassinated in 1901, he did not have as a priority a reform agenda opposing monopoly. Initially, Roosevelt was more concerned about appeasing the conservative leadership of the Republican Party to win reelection in 1904. Changes in corporate structure and a new spirit of reform pushed Roosevelt in a new direction, toward “trust-busting.”

In the late 19th century, merchants and shippers in the Midwest had sought to have the federal government regulate what they saw as the monopolistic practices of the railroad companies. Midwestern companies and small farmers sought to reduce what they perceived as the unfair advantages in railroad shipping rates held by rival companies in the East and Far West. In 1887 Congress had passed the Interstate Commerce Act, which created the Interstate Commerce Commission (ICC) to regulate rate-setting by the railroad companies. The courts limited the powers of the commission over the years, and railroad regulation remained largely unenforceable, much like the Sherman Antitrust Act of 1890.

Substantial support for Roosevelt’s antitrust policies surfaced in the congressional elections of 1902. Soon after the elections, Congress passed the Elkins Act of 1903 to prohibit discriminatory railroad rebates. The act strength-

ened the ICC’s ability to regulate railroads by making both receiving and granting rebates a crime and holding railroad officials personally liable if rebating occurred. In addition, it forbade railroad companies from setting rates different from their published rates.

During the 1904 presidential campaign, Roosevelt called for a Square Deal, promising ordinary Americans fairness on the free market by controlling the abuses of corporate power. After his reelection, he pushed further for railroad regulation, but the conservative Republican bloc in Congress adamantly opposed any government rate setting. After two years of debate, Congress passed the HEPBURN ACT of 1906, which gave the ICC the power to set maximum rates once a shipper filed a complaint. In addition, the act dictated using uniform methods of bookkeeping and authorized the ICC to inspect the financial records of railroad companies. The courts preserved the power over the ICC to review its rate decisions.

As a result of Roosevelt’s active efforts to regulate monopolies, the president became known as a trustbuster. Roosevelt believed that corporate monopolies presented the most serious problem of the time and that unregulated competition was ultimately destructive to American capitalism. At the same time, he viewed big companies as part of “modern progress.” He wanted to reduce the misuse of corporate power, not to eliminate big corporations altogether.

### Ellis, Henry Havelock (1859–1939) *scholar*

One of the earliest and most successful popularizers of SIGMUND FREUD’s theories of sexuality and a prolific author and translator, Ellis was born in Croydon Surrey, England, in 1859, to Edward Peppin and Susannah Wheatley Ellis. Havelock Ellis’s father was a merchant sea captain, and his mother assumed primary responsibility for raising Havelock and his four sisters. He later argued that his childhood shaped his own unconventional sexual identity. Ellis was educated in a boarding school, where he focused on literature, language, and philosophy. At age 16, he joined his father’s ship crew as a cabin boy, but left the ship to take a teaching position when it reached Australia. He returned to England in 1879.

Soon after he returned, Ellis took up the study of medicine at St. Thomas Hospital in London. He read broadly

in the fields of science, philosophy, and sociology. Greatly influenced by Freud, Ellis became a physician but spent most of his career in the scientific study of sexuality. *Sexual Inversion*, the first of his *Studies in the Psychology of Sex*, was published in 1897 and banned on grounds of obscenity. The series, published in seven volumes between 1897 and 1928, made a major contribution to the knowledge of human sexuality. In particular, it helped to open the door to understanding homosexual identity and experience. Throughout his life, Ellis continued to publish on the subject, authoring such studies as *The Dance of Life* (1923).

A member of the socialist Fabian Society in Great Britain, Ellis had wide influence internationally and especially in the United States. For MARGARET SANGER and other American sexual radicals, he became the voice of sexual liberation. His repudiation of Victorian repression and celebration of sexual freedom informed Sanger's thought, and their friendship aided her in her crusade for BIRTH CONTROL. Their correspondence lasted over 25 years with little interruption, and Sanger later assisted Ellis financially in paying a salary to his companion and giving him money for a small house. The challenge Ellis presented to both puritanical sexual codes and even the institution of marriage meant that his work suffered from the censorship laws that dogged Sanger's early career. Her support of his work gave him access to an American audience he might otherwise not have reached. His writings made him more popular than Freud in the early 20th century.

In his twenties, Ellis met and corresponded with South African novelist Olive Schreiner, and the two had an affair. He later married Edith Lees in 1891. The marriage lasted until her death in 1916. Ellis wrote at length about this marriage in his autobiography, *My Life* (1940), as one of both companionship and convenience, as Lees was an acknowledged lesbian. Ellis later became involved with his assistant, teacher and translator Francoise Lafitte Cyon. Havelock Ellis died in 1939 at age 80.

## entertainment, popular

The years between 1900 and 1930 saw a growth in the forms and availability of popular entertainment. From open air concerts and VAUDEVILLE shows to nickelodeons, big-screen films, and radios, people from all walks of life spent an increasing amount of time and money to be entertained. The chief trends were toward a consolidation of the entertainment industry, from the creation of theater syndi-

cates and moving picture chains to the growing dominance of major labels in the recording industry and national networks in radio. While musicians and dancers continued to perform on the streets, in parks, on porches and in small theaters, in saloons and juke joints, popular entertainment was on its way to becoming mass entertainment, controlled by large corporations that had superior technology, distribution, and production.

Popular theater, including melodrama, musical theater, burlesque, and legitimate drama had long held a place in American society. What was different was that the range of theatrical entertainment and its venues broadened considerably. The turn of the century witnessed the emergence of the Broadway theater district in New York City and the creation of major theater syndicates to fund Broadway productions and touring shows. By 1910, there were over 40 legitimate theaters in the district, and it bristled with activity from the production of operettas, musicals and musical revues, and repertory theater. That decade saw many new operettas, including Victor Herbert's *Babes in Toyland* (1903) and *Naughty Marietta* (1910), and Franz Lehár's *The Merry Widow* (1907). Soon, however, operettas lost out in competition with new musical shows and legitimate theater. Repertory theater under such lights as Eva Le Gallienne emerged to take its place in the district. The rapid rise of playwright Eugene O'Neill also gave new importance to the Broadway stage. Having begun in Provincetown, Massachusetts, as part of the GREENWICH VILLAGE crowd, O'Neill dominated Broadway drama in the 1920s, and his plays such as *Beyond the Horizon* (1920), *The Emperor Jones* (1920), *Desire Under the Elms* (1925), and *Strange Interlude* (1928) earned him both appreciative audiences and three Pulitzers.

The most popular form of entertainment was the vaudeville show. Modern forms of movies and broadcast television owe much to the early years of the century when vaudeville dominated the entertainment industry. Vaudeville had many influences—minstrel shows, ethnic humor, and music from TIN PAN ALLEY, which was in itself a mixture of musical styles. The bill of any vaudeville production brought to its audience jugglers, musicians, tap dancers, women singers, muscle men, slapstick routines, and standup comedians such as W. C. Fields, Jack Benny, George Burns, and Mae West, who later found fame in RADIO and movies. Vaudeville entrepreneurs were inventive enough to showcase boxer JACK JOHNSON, and they even offered a contract to anarchist EMMA GOLDMAN to speak to popular audiences.

At the high end of vaudeville stood the musical revue. *The Follies* was among the most famous and most opulent. Beginning in 1907, Florenz Ziegfeld launched a series of 20 annual musical revues that captured the popular imagination. Gorgeous costumes highlighted the American Girls

Actress Clara Bow, Hollywood's "It" girl (Library of Congress)

in the chorus, and music and comic sketches made up the balance of the show. By the 1920s, Ziegfeld had hired away from vaudeville such legendary performers as Fanny Brice, Bill "Bojangles" Robinson, and Eddie Cantor. For those in musical theater, Ziegfeld's productions were a hard act to follow; but the period after 1900 saw the proliferation of Broadway musicals written by such giants as George M. Cohan and Jerome Kern. Cohan's shows were much in the vein of musical revues, strung along less by a plot line than a song list. Musicals like *Little Johnny Jones* (1905) and *Forty-Five Minutes from Broadway* (1906) produced such hits as "I'm a Yankee Doodle Boy," "Give My Regards to Broadway," and "Mary, It's a Grand Old Name." In 1920, Noble Sissle and Eubie Blake produced *Shuffle Along*, which was the first major show by African Americans and signaled the increasing presence of black actors and writers in theater. Among other musicals, GEORGE GERSHWIN's *O, Kay!* (1926) and Kern's *No, No, Nanette* (1925) and *Show Boat* (1927) continued to build Broadway's reputation.

Increasingly, though, the Broadway musical was oriented toward a narrative, often of love lost and regained, in which the songs helped to move the story along. *Show Boat* was the pioneer in this development. At the same

time, touring companies helped to spread the word of what was happening in New York with performances in theaters around the country, and the musicals and plays, like vaudeville shows, made much of their money on the road. Touring companies had another effect, however, in helping to suppress much local ethnic and working-class theater. Public halls and theaters became the venues of big ticket shows, and smaller independent theaters often closed or converted to movie theaters to survive the change.

Early movies appeared about the turn of the century as filmmakers moved to take over a novelty item and turn it into a popular art form. Edwin Stratton Porter was one of the pioneers in the MOVIE INDUSTRY. In late 1902 or early 1903, he created the *Life of an American Fireman*, his first motion picture. The following year, he made his classic, *The Great Train Robbery*, the first of a long line of Western movies. Porter's studio also first employed DAVID WARK GRIFFITH, who began his film career as an actor. By 1908, he began experimenting with his own films, and in 1915 he produced what was considered his masterpiece, *BIRTH OF A NATION*. Mack Sennett's studio produced a series of Keystone Kops movies, and it helped to foster the career of Charlie Chaplin as well. In these early years, there was great movement from one studio to the next and in the types of film produced.

The first silent films were relatively cheap to make and could be distributed through informal networks nationwide. In this era, immigrant neighborhoods had their own small theaters, above or in community buildings and neighborhood stores. They showed foreign-language movies produced independently or dubbed from studio films. Middle-class theaters were larger and more palatial, but they too had access to a large range of independent and studio-made films. One way to view the new films was the nickelodeon, an individual viewing machine. John P. Harris and Harry Davis opened the first nickelodeon arcade in Pittsburgh in 1905. Patrons could view a movie for five cents. It was well within the means of working-class viewers. As a result, the industry spread rapidly. By 1908, the number of nickelodeons in American had reached an astounding 10,000.

Music also found a mass audience in the creation of the phonograph. Originally a luxury item, phonograph recordings became popular in the years before and after WORLD WAR I. In 1901, the Victor Talking Machine Company was mass-producing phonographs to play recorded music on cylinders of celluloid or wax or on discs made of laminated shellac. By 1906, the Victrola model gramophone, which stood upright and had an enclosed tapered horn, became the industry standard. Victor spent over \$50 million on print advertising for its new product. The flat disc triumphed over the cylinder, and new technology made for mass production of music. In 1919, though electrical

recording was still experimental, the first recording to become a million seller hit the market. Paul Whiteman and his orchestra recorded “Japanese Sandman” and “Whispering” and set off a music craze. JAZZ, BLUES, bluegrass and country music, classical music, and patriotic songs all saw their first recordings from 1917 on. Gennett Record Company, one of the largest labels, issued some of the earliest jazz recordings by Jelly Roll Morton. Record sales reached a decade high of \$106 million in sales in 1921. Bessie Smith recorded “Downhearted Blues” in 1923, and Fiddlin’ John Carson made “Little Old Log Cabin in the Lane,” the first country hit. That year, however, the growing popularity of radio and the increasing availability of music programming started to erode the market for records. Only a few years later, in 1925, electric recording became standard, which tended to displace smaller record companies. At the end of the decade, in 1928, the Radio Corporation of America bought the Victor Talking Machine Company and became RCA Victor. All of these moves consolidated power in the recording industry into the hands of a few companies—RCA Victor, Columbia, and Edison. None of these corporate moves, however, discouraged popular audiences from listening to and even, on occasion, purchasing recordings.

The spread of RADIO technology and broadcasting altered popular entertainment, including the recording industry. In 1920, station KDKA in East Pittsburgh made the first commercial broadcast. By 1922, there were more than 3 million homes with radios. By 1930, 40 percent of all homes had radios. Over the decade, there were more than \$60 million a year in radio sales. By 1929, more than \$850 million in radios had been sold. In addition, by 1930, more than 150 stations filled the airways with music, news, and entertainment.

Locally sponsored shows broadcast folk songs, down-home blues and gospel, and hillbilly music, political party and labor union news, and church hours. New musical forms from jazz to country-western emerged as local musicians moved from juke joints to the radio dial. Urban ethnic and minority communities could lay claim to their own radio shows, which mixed community news with news from the nation and abroad. But the spread of radio narrowed the audience for records, even as it advertised musicians.

Such breadth in radio was a function of the low cost of early radio facilities. As technology improved, demanding more power from transmitters and a larger investment, there was a corresponding loss of diversity in programming. Further, new government regulation of the radio industry raised licensing fees and shifted more stations into the new radio networks—the National Broadcasting Company (NBC) established in 1927 and Columbia Broadcasting Company in 1928. Much of the local flavor was lost when networks set local programming from national radio networks in New York.

The transformation of the movie industry followed the same path as radio, although the consolidation of the industry began earlier. When the studios began to merge and create theater chains, the choices and content of films narrowed. Independent films became harder to make, both because new technology made filmmaking more expensive and because the chain theaters refused to book independents. By 1927, with the advent of sound pictures in *The Jazz Singer*, the cost of making films increased and edged independents out from the national market completely. Further, sound movies, which featured stars from the silent era as well as new stage actors, were available largely through the chains. As a result thousands of small movie theaters failed. The major movie studios soon began to refuse to assign women directors, producers, and screenwriters work, which in turn marginalized women in the industry. At the same time, the popularity of the movies increased the number of large theaters. By 1930, there were more than 22,000 movie theaters nationwide.

The 1920s movie audience was drawn toward nostalgic views of the past—as in the popularity of *westerns*—and toward movies that explored modern life and morals, from the sexual ambiguity of Rudolph Valentino and Douglas Fairbanks (*The Sheik* [1921] and *The Thief of Bagdad* [1924]) to a fascination with airplanes, trains, and automobiles in adventure films and the “dancing daughters” of the silver screen. Comedies starring Charlie Chaplin, Harold Lloyd, and Buster Keaton continued to draw audiences, but an increasing number of younger viewers opted for feature films that echoed changing sexual mores. As a bookish matron in *Why Change Your Wife?* (1920), Gloria Swanson adopted a “sleeveless, backless, transparent, indecent wardrobe” and transformed herself into the object of her former husband’s attentions. In *It* (1927), Clara Bow revealed her “good old-fashioned sex appeal” as a “slam-bang kid” with “spirited bravado.” For a devoted youth audience, the movies had become “a liberal education in the art of making love.” Further, surveys suggested that movie stars had replaced politicians, military leaders, and cultural figures as the principal role models of young men and women.

Entertainment industries continued to expand their products and profits throughout the 1920s and into the depression decade of the 1930s. For most entertainers, the growth offered an opportunity to expand their audience and showcase their talents. Still, the corporate look and feel of popular entertainment could also undermine talent. Local theaters, music halls, and radio stations had to compete with the national product, and small ethnic or rural enterprises often lost out to the emerging national culture.

## environment

The rapid growth of mass production, intensive agricultural production, and rapid urbanization that took place between 1900 and 1930 had a profound and frequently harmful impact on the natural environment in the United States. In a relatively short period of time, the nation underwent a fundamental transformation from a rural population that derived its livelihood from agricultural production to one that was predominantly urban and industrial. Across the country, millions of people moved from farms to urban areas in search of better-paying jobs and more affluent lifestyles. The population in industrial boomtowns such as Detroit, Chicago, and Los Angeles skyrocketed during this period. In 1900 the nation's urban population was 30.2 million, or 39.6 percent of the nation's total population. By 1930 the number of urban residents had more than doubled to 69.1 million, which represented 56.1 percent of the population.

The extraction of raw materials and the waste generated by industrial expansion further resulted in widespread pollution. Lax or nonexistent regulation allowed corporations to dump industrial waste into rivers, streams, ponds, and empty fields, where it subsequently polluted local habitats and worked its way into the water supply, affecting the entire food chain. Similarly, the extraction of minerals and raw materials from mines resulted in substantial runoff of concentrated waste that was often highly toxic. In addition, the mines typically resulted in widespread deforestation and scarred the local environment.

The growth in urbanization also required greater agricultural production. Farmers responded to growing urban and worldwide demands for food by adopting intensive crop cultivation, which included the use of mechanized farm machinery and equipment. As a result, there was a rapid increase in the production of corn, wheat, cotton, soybeans, pork, cattle, and chicken. For example, wheat production increased from 599 million bushels of wheat in 1900 to 914 million bushels of wheat a year by 1929. As agricultural production increased, crop prices declined. Farmers responded by continually searching for ways to increase production and a vicious cycle ensued, all of which put a tremendous strain on the natural environment.

As industrial development and urbanization increased, there was growing concern about the impact modern

industrial society was having on the environment and the nation's natural resources. A small but vocal group of naturalists, artists, and outdoorsmen directed their attention to the ways in which natural resources were being depleted. They formed the core of an emerging conservation movement. At the same time, an even smaller group of environmentalists began calling for the complete preservation of wilderness areas.

Concern about the conservation of natural resources dates back as early as the 1830s and 1840s and the transcendentalist writings of Ralph Waldo Emerson and Henry David Thoreau. They, along with later naturalists John Muir, John James Audubon, and George Perkins Marsh, warned that the nation's natural heritage was being unnecessarily squandered. The conservation movement emerged in earnest when wealthy landowners began to consolidate and exploit western land and water rights. Many viewed the lush forests and rugged beauty of the West as a national treasure and feared that unless something was done, the West would be stripped of its abundant resources.

John Muir, a world-renowned botanist, was the most influential of the early conservationists and used his influence to lobby for the creation of Yellowstone National Park (1872) and Yosemite National Park (1890). In 1892 he founded the Sierra Club, which today remains the nation's most important conservation organization. From the outset, the conservationist ranks were extremely diverse. They included sportsmen and hunters like THEODORE ROOSEVELT, naturalists such as Muir and Audubon, scientists, and land use proponents, such as GIFFORD PINCHOT. By 1900 two distinct camps had emerged—conservationists and the preservationists. The conservation camp, led by Secretary of the Interior Gifford Pinchot, emphasized the rational and efficient use of resources in order to conserve them for future economic expansion. Preservationists, led by Muir and others, while not opposed to the efficient use of resources, argued that some regions, because of their intrinsic aesthetic beauty, ought to be preserved and unspoiled by human use. Both Muir and Pinchot vied for the ear of Roosevelt and attempted to influence federal policy. Muir urged Roosevelt to establish more federal wilderness areas, even if it meant that some resources would be permanently off limits to development, while Pinchot insisted only that resources be utilized efficiently. Permanently preserving natural resources, Pinchot argued, would curtail the nation's growth and development.

The conflict between Muir and Pinchot and between preservationists and conservationists came to a head in 1912 with the construction of the Hetch Hetchy dam on the west side of the Sierra Nevada mountains. When California public utilities introduced a plan to dam and flood the Hetch Hetchy valley, Muir and other preservationists

Lumberjacks atop a felled Humboldt sequoia tree in California, ca. 1905 (*Library of Congress*)

urged Roosevelt to block the dam's construction. The dam, which would provide fresh water to residents of San Francisco, was precisely the type of efficient use of resources called for by Pinchot and other conservationists. For Muir and the preservationists, the damage caused by the flooding of the scenic Hetch Hetchy valley would be catastrophic and far outweighed any short-term economic benefit the dam might bring. Of the proposed dam Muir stated, "These temple destroyers, devotees of ravaging commercialism, seem to have perfect contempt for Nature. Instead of lifting their eyes to the God of the Mountains, they lift them to the Almighty Dollar." Conversely, Pinchot concluded, "I am fully persuaded that by substituting a lake for the present swampy floor of the valley, the injury is altogether unimportant compared to the benefits to be derived from its uses as a reservoir." Pinchot, the conservationists, and those favoring economic development persuaded Roosevelt that the dam's utility far outweighed the damage to

the valley, and the dam was built in 1913. The influence of preservationists dwindled in the aftermath of the Hetch Hetchy debate.

Progressives, investigative reporters, and public and occupational health advocates, such as UPTON SINCLAIR, IDA TARBELL, and ALICE HAMILTON, occasionally expressed concerns about the impact of industrial waste produced by slaughterhouses, steel mills, automobile plants, coal mines, tanneries, and chemical plants. Between 1900 and 1930, there were concerted efforts to improve public sanitation and to protect the health of industrial workers and urban residents, but much of this concern was focused on the impact industrial pollution was having on workers and the general public over the short term and not on the environment over the long term. There were few effective efforts on the part of federal, state, or local governments to protect or preserve natural resources and the environment during these decades.

### Equal Rights Amendment (ERA)

Called the “Alice Paul Amendment,” this constitutional amendment was first introduced into both houses of the U.S. Congress in 1923. The Equal Rights Amendment (ERA) proposed to add the simple language that “Men and women shall have equal rights in the United States and every place subject to its jurisdiction” to the Constitution. Its author, ALICE PAUL, was the motive force behind militant suffrage tactics in the Congressional Union and the NATIONAL WOMAN’S PARTY (NWP). After the Nineteenth Amendment granting women the right to vote was ratified in 1920, the NWP turned away from conservative approaches to women’s rights in order to launch massive lobbying efforts in favor of equal rights for women at the national and state levels. The key to their campaigns was the case for women’s absolute equality under the law. Arguing against those who treated women as a protected class, the NWP urged that women should have the same rights that men had. For Alice Paul and her followers, no sexual difference between men and women justified unequal pay, restrictions on women’s labor, or women’s lack of political rights. Women’s loss of citizenship when they married foreign nationals, for example, discriminated against women, since men suffered no such loss. While women could fight for legal changes on an issue-by-issue basis, as they did with the CABLE ACT, a blanket constitutional amendment was preferable. Despite these arguments, the Paul amendment did not receive support for passage in the 1920s. Similar bills were proposed and failed in several states, including Minnesota and Wisconsin.

The Equal Rights Amendment sparked a debate among feminists on the appropriate strategy to ensure women’s equality in public life. Women activists divided into two camps: one advocated women’s rights on an equal

basis with men, the other was more concerned with granting women legal protection based on their differences from men. The latter group believed that women’s role as mothers required legal protections that were more important than formal legal equality. Further, those who fought for protective wage and hour legislation for women workers, including labor unions such as the INTERNATIONAL LADIES’ GARMENT WORKERS UNION, thought that the passage of an equal rights amendment would jeopardize these laws. When the Supreme Court declared a District of Columbia minimum wage law for women unconstitutional in *ADKINS v. CHILDREN’S HOSPITAL* in 1923, the fears of the protectionists seemed to be confirmed. Arguments about women’s equality continued to block efforts to introduce and pass state and national equal rights legislation.

Divisions among women on the various merits of sexual difference and sexual equality were only one barrier to the passage of the ERA. Women’s political weakness in the decades between World War I and World War II, and the failure of women to demonstrate unity at the polls, kept legislation for women, whether equal rights acts or social welfare provisions, such as the continuation of the SHEPARD-TOWNER ACT for maternal and infant health care, from passing Congress or state legislatures. It would not be until 1946 that the ERA was shown any serious consideration from Congress, in response to women’s contributions to the war effort. And it was not until the 1970s, with the revival of the feminist movement, that the ERA was finally reconsidered and passed through Congress. It remains unratified today.

### Espionage Act (1917)

Enacted as a guard against domestic subversion of the U.S. effort in WORLD WAR I, the Espionage Act of 1917 was a controversial law that threatened domestic civil liberties. As the efforts at progressive reform in the early 20th century gave way to a focus on the war in Europe, the Wilson administration grappled to find ways to bolster support for American intervention. Public opinion was sharply divided about the conflict and how the United States should respond. Given the large influx of immigrants to the United States since the 1880s, new ethnic and national groups contributed to the social and political conflict over

the war. German immigrants still formed the largest foreign-born group, 2.3 million, in the population. In addition, there were more than two million immigrants from the various parts of the Austro-Hungarian Empire, another major combatant.

Throughout his first term as president, WOODROW WILSON and others expressed concern about the large immigrant population in the United States and frequently referred to the need for national loyalty. Running for reelection in 1916, President Wilson made Americanism a dominant theme of his campaign. Along with Wilson's desire to build a sense of national unity, the war led his administration to secure legislation to dampen dissent and opposition and to further promote the cause of national unity in the United States. As Wilson moved toward a pro-intervention policy in the European conflict, he saw this as an opportunity to publicize and export American democratic ideals.

Fearing that opposition would undermine his ability to bring the United States directly into the conflict, Wilson favored policy initiatives that fostered and promoted patriotism. In this vein, the COMMITTEE FOR PUBLIC INFORMATION was created in 1917 to publicize and popularize the war and the reasons for American involvement in this conflict. A major outcome of this drive for national unity was to actually create more division within the United States. In particular, what originated as an anti-German campaign resulted in an anti-immigrant crusade, which culminated in the first in a series of restrictive immigration laws passed by Congress between 1917 and the mid-1920s.

During the controversial debate about national identity, the Wilson administration called upon Congress to pass legislation that would silence dissent and encourage support for the United States in World War I, which the country officially entered in April 1917. As Wilson called upon Congress to declare war on Germany and its allies, Representative Edwin Webb of North Carolina and Senator Charles Culberson of Texas began to craft legislation that would give the president the ability to impose "stern repression" to ensure unity behind the nation's emerging war effort. The Espionage Act, as it was known when enacted in early June 1917, furnished the government with ample power for the suppression of those who opposed the war. The act imposed stiff fines of between \$5,000 and \$10,000 and jail sentences of up to 20 years for individuals convicted under this law. The law went far beyond simply attempting to prevent spying for the enemy. Instead its main objective was to make it illegal to write or utter any statement that could be construed as profaning the flag, criticizing the Constitution, or opposing the military draft.

The extreme nature of this legislation constituted the most drastic restriction of free speech since the enactment of the Alien and Sedition Acts of 1798. The Socialist Party and the INDUSTRIAL WORKERS OF THE WORLD

(IWW) had emerged by 1917 as the most vocal and organized forces to oppose America's involvement in the war in Europe. Accordingly, they quickly became among the first groups to feel the strong arm of the American legal system after the passage of the Espionage Act. The head of the Socialist Party, EUGENE VICTOR DEBS, received a 10-year jail term for making an antiwar speech in Canton, Ohio, in 1918. In that same year, some 2,000 members of the IWW were arrested under the authority of the Espionage Act. The Espionage Act helped fuel a movement to protect civil liberties in the postwar era.

## ethnic organizations

In the wake of the mass immigration of the early 20th century, ethnic organizations flourished in the United States between 1900 and 1930. The first 14 years of the century brought a peak in total arrivals for the long and massive wave of immigration that had lasted from 1830 to 1914. During this 80-year period, more than 22 million immigrants arrived in the United States, with some 6 million alone arriving at the shores of the United States between 1900 and 1910. On the whole, the American economy expanded sharply during these decades. Despite this widespread expansion, large numbers of the immigrants arriving in the United States were not in a position to be primary beneficiaries of economic growth. Instead, most found work as industrial laborers in the rapidly expanding industrial economy.

Arriving in urban industrial centers, immigrants after 1900 often had little choice but to find employment as unskilled workers in the factories that characterized the American economy. The size of the industrial workforce grew dramatically from 957,000 in 1849 to 4,252,000 in 1889 and 7,036,000 by the eve of WORLD WAR I. Finding work in the nation's industrial economy did not necessarily bring with it the prosperity and economic gain that many immigrants sought. The economy faced several episodes of crisis. Having no recourse to government programs for relief, many immigrants faced desperate economic straits with each turn of the business cycle.

To help soften the economic conditions that many immigrants faced in the United States, many ethnic groups organized fraternal societies that provided assistance during difficult times. Not only did immigrant workers face periodic bouts of unemployment, but also family illnesses, unexpected deaths, or housing problems created trying times

for newly arrived individuals and their families. Given the sometimes hostile response that many immigrants faced, they became suspicious of some forms of public assistance. Most philanthropic organizations attached conditions to their assistance and often had difficulty understanding and communicating with immigrants. These factors contributed to the emphasis placed on self-help organizations in immigrant communities. Ethnic groups tried to care for their own. Such organizations as the Bohemian Charitable Association, the Polish Welfare Association, and the Jewish Home for the Aged were formed in the early part of the century with the express purpose of assisting their members. Within their ethnic communities, most immigrants could expect to be assisted not only by formal ethnic organizations, but also by their neighbors and fellow immigrants. Everything from bread to haircuts and donations of money was extended to neighbors in trouble.

The onset of war in Europe in 1914 evoked renewed efforts by ethnic communities and organizations as they sought to help refugees displaced by the conflict. After the war, many small ethnic organizations moved toward consolidating their efforts into large umbrella groups. In Chicago, for example, the Associated Jewish Charities and the Associated Catholic Charities emerged from several smaller community-level groups. The attempt to provide economic relief to immigrant workers in the United States through ethnic organizations survived through the 1920s. The onset of the Great Depression and the enactment of various pieces of social legislation resulted in many ethnic organizations being displaced by the federal agencies and services created by President Franklin D. Roosevelt's New Deal.

## eugenics

Eugenics is both a theory of human heredity and selective reproduction and the social and intellectual movement that sought population policies aimed at improving the human race through selective breeding. Eugenics advances the theory that all human traits are inherited and that the quality and character of offspring reflects the quality of their ancestors' genes and environment. As a scientific movement, eugenics began in Europe during the last third of the 19th century. British anthropologist Sir Francis Galton, building on Gregor Mendel's agricultural breeding

research, Charles Darwin's theory of evolution, and the emerging science of genetics, coined the term *eugenics*. He presented it as a medical science with the goal of improving the human race. Galton was an admirer of Malthusian population control and concluded that eugenics could help society encourage selective breeding of the superior Anglo-Saxon race while discouraging the breeding of the lesser races. This, according to Galton, would improve "the general tone of domestic, social and political life" within a nation.

The eugenics movement in the United States evolved from Galton's research but differed greatly in its application. Galton's "positive eugenics" approach of encouraging "fit" people to reproduce lost its appeal as American scientists began to focus their research toward "negative eugenics," which emphasized a perceived link between the inheritance of unfit traits and social decay. Eugenics in the United States embraced a creed that stressed the need to control the unfit and their effect on society.

In 1910 with the establishment of the Eugenics Records Office, American eugenicists such as Charles Benedict Davenport, Harry Laughlin, Alexander Graham Bell, and Henry Goddard advanced eugenics as a way to build a racially superior society. They focused their research on identifying negative human traits and the effects of bad environments on heredity. The establishment of eugenics associations, committees, medical panels, laboratories, and departments at respected universities helped to give the American eugenics movement credibility as a field of SCIENCE during the first two decades of the 20th century.

The emergence of the eugenics movement in the United States coincided with the rapid growth of cities, the influx of immigrants from eastern and southern Europe, and the migration of African Americans from the South to northern cities. By the early 20th century, American social reformers were preoccupied with urban crime and individuals living at the margins of society. Many progressive reformers linked the new IMMIGRATION with the decaying urban ghettos and poverty. They suggested that the unfit immigrant masses caused most city problems. They concluded that if the unfit classes in the urban slums were allowed to breed unchecked, they would soon outnumber the middle and upper classes, who were having few children. Eugenicist Robert Reid described this unchecked population imbalance as "race suicide." In 1916, lawyer and eugenicist Madison Grant published his influential book, *The Passing of the Great Race*, which advocated the separation and eventual elimination, through selective breeding, of what Grant viewed as "inferior races." Grant's book employed a racial and racist understanding of history and anthropology to advocate for the separation and eventual elimination, through selective breeding, of what he saw as "inferior races."

The widespread acceptance of eugenics also surfaced in the 1920s in the BIRTH CONTROL movement. Its leader, MARGARET SANGER, began to promote contraception not only as a means to women's health and well-being but also as a way to control the poor population of cities. Through her journal, *Birth Control Review*, Sanger promoted voluntary motherhood, family planning, and contraception for immigrants and the poor. While she had earlier fought for contraception as a means of improving the lives of working-class and poor women, by the 1920s she argued that birth control could be used to stop the feeble-minded, defective, and dangerous population from reproducing. Sanger supported her birth control program by pointing out the cost to society of prisons, insane asylums, and medical care of the unfit. She also argued that charity only encouraged the poor to continue their dangerous ways. As eugenics propaganda raised fears that the nation's promise was threatened and that the poor and unfit would outnumber the fit and drive society into ruin, eugenics became more popular among a broad spectrum of Americans.

Eugenics embraced a creed of the natural struggle between the fit and unfit. As a creed, it became less concerned with the accuracy of scientific research and more concerned with advancing a social agenda of ridding American society of the weak, dangerous, and unfit. Eugenics supporters in the 1920s adopted a social agenda based on naturalism and the determinism of heredity. They began to use questionable scientific evidence to persuade legislators that society was increasingly at risk from "feeble-mindedness." During the Progressive Era, "feeble-mindedness" became a vague legal term that encompassed most forms of mental or physical defect, illicit behavior, or social dependence. Fueled by culturally biased INTELLIGENCE TESTS that ranked immigrants based on their degree of inherited feeble-mindedness, eugenics became the "science" of white supremacists, Social Darwinists, and Progressives who believed American society was engaged in a competition for "the survival of the fittest."

Eugenicists such as Albert Johnson manipulated and falsified data before CONGRESS to push for immigration reform that would restrict the inferior non-Nordic immigrants from flocking into America's industrial centers. The NATIONAL ORIGINS ACT of 1924 reduced annual immigration to the total in 1890, approximately 165,000. It also set quotas for different ethnic immigrants.

To engineer a racially superior society and control the unfit that were living in the United States, eugenics-minded reformers lobbied for new standards of marriage that forbade interracial marriage. By 1931, 27 states required the feeble-minded to be sterilized before they could marry. In the 1920s, sterilization began to be applied more broadly to the feeble-minded in institutions. The most infamous case regarding sterilization and hereditary determinism was

*BUCK V. BELL* in 1927. This decision gave states the authority to implement forced sterilization laws against those deemed "unfit."

### Expatriation Act (1907)

The Expatriation Act of 1907 was intended to clarify the citizenship status of Americans who had established foreign ties. Under the provisions of this act, Americans who became citizens of another country and naturalized immigrants who lived abroad for too long would be expatriated, that is, lose their American citizenship. The minor children of naturalized citizens now would have to move to the United States before they could claim American citizenship. The most controversial portion of the act was section 3, which revoked the citizenship of any American woman who married a citizen of another country. The Expatriation Act thus established derivative citizenship for women, meaning that a woman's citizenship was based on that of her husband, regardless of where she had been born.

In passing this act, CONGRESS argued that it was making the laws pertaining to women's citizenship consistent. Previously, the Naturalization Act of 1855 established that any foreign woman who married an American citizen would become a citizen, since her allegiance would shift to the nation of her husband. The Expatriation Act made the same argument about American women who married men who were citizens of other nations. Marriage to foreign men was perceived as a great threat to American society during the early 20th century, as anti-immigrant sentiment swelled in response to increases in both the number and diversity of immigrants. Thus it seems likely that this act was partially intended to deter American women from marrying foreign men and to punish those who did so. As Congressman N. E. Kendell would put it in a 1912 hearing on the Expatriation Act: "We do not want our girls to marry foreigners."

Loss of citizenship for women had serious consequences. Expatriated women could lose their jobs. They became ineligible for most public assistance programs and could be deported from the United States or denied reentry. If a woman was deported, she ran the risk of becoming stateless, unless her husband's nation granted her citizenship. Additional difficulties arose during WORLD WAR I, when the American-born wives of German and Italian men were declared enemy aliens. If a woman married an Asian man, who could not legally become a citizen, she could not regain her American citizenship until he died. If she herself was of Asian descent, she would never be allowed to regain her birthright citizenship.

Little progress was made in the struggle against the Expatriation Act until women gained the right to vote in 1920. At that point, opponents of the act used anti-immigrant sentiment to point out that an uneducated immigrant who married an American man would be able to vote while an educated native-born woman who married a foreigner would not. For this reason, Congress in 1922 passed the

Married Women's Independent Citizenship Act, known as the CABLE ACT. The law ended the practice of expatriating women who married foreign citizens, with the exception of those who married "an alien ineligible to citizenship"—in other words, Asian men. In this way, the racial policing function of the Expatriation Act remained intact, and native-born women who married Asian men continued to lose their citizenship until this practice ended in 1931 with the passage of the Second Cable Act.

### Farmer-Labor Party

With roots in the Populist Movement of the 1890s and midwestern PROGRESSIVISM in the early 1900s, the Farmer-Labor Party formed as a third-party alternative in American electoral politics. The Farmer-Labor Party and its predecessor, the NON-PARTISAN LEAGUE (NPL), grew out of farmer discontent over deteriorating conditions in agriculture in the early 20th century. Increased agricultural production in the 1910s had resulted not in a better standard of living for farmers, but in overproduction and a sharp drop in farmers income. Falling into debt, many farmers were forced into tenancy, or they left agriculture altogether.

In 1915, wheat farmers in North Dakota formed the NPL on a platform of state-run enterprises. Independent politics spread throughout the West after the NPL had successes in the 1916 elections. In Minnesota, farmer-laborites established the Minnesota Farmer-Labor Party after they failed at the nonpartisan strategy in the Republican primary of 1918.

When employers went on the offensive after WORLD WAR I to establish the open shop (see OPEN SHOP MOVEMENT) in many mass production industries, trade unions shifted their efforts to political action. With participation from the NPL, the Socialist Party, local farmer and labor parties, and labor unions set up the Conference for Progressive Political Action (CPPA) in 1922. Independent CPPA candidates were quite successful in the 1922 elections. Twelve out of 16 CPPA gubernatorial candidates won. The Minnesota Farmer-Labor Party took control of the state legislature and won half Minnesota's seats in Congress. Farmer-Labor candidates were elected to one Senate seat in 1922 and won the other Senate seat in 1923.

In 1924, the CPPA ran an independent ticket in the national elections, with Wisconsin Progressive ROBERT LA FOLLETTE and Montana Democrat Burton K. Wheeler as presidential and vice presidential candidates. The La

Follette ticket did surprisingly well in the 1924 elections, winning nearly 17 percent of the popular vote. La Follette won in Wisconsin and came in second in nine western states. Along with Wisconsin, the states of California and Minnesota had significant industrial populations.

Although the Farmer-Labor Party had many state-level successes, the third-party movement ultimately failed at the national level. Immediately after its formidable challenge to the national two-party system in 1924, the third-party movement collapsed. The obstacles to waging a national effort proved to be insurmountable. The major labor leaders ultimately maintained their ties to the Democratic and Republican Parties. Meanwhile, the farmer-labor coalition suffered from persistent internal divisions that undermined its successes. In addition, its supporters faced other setbacks: the decline of organized labor on the national level as well as an increasingly conservative political climate in the 1920s. Only in Minnesota did the farmer-labor efforts remain strong through the 1930s.

Since the Populist era, American radicals had attempted to forge farmer-labor unity, seeing both groups as producers exploited by the capitalist system. In the 1924 presidential elections, the loose coalition of farmer-laborites came closer than at any other time in mounting a third-party challenge in the electoral system. However, the Farmer-Labor Party and other progressive movements of the era were unable to translate their state successes into a long-term national alternative to the two-party system.

**Federal Farm Loan Act (1916)**

A primary goal of farm organizations in the United States in the early 20th century was to create a government program for farm credit. Passed in 1916, the Federal Farm Loan Act opened the door to federal government support with a program of low-interest loans. Having been elected president in 1912 on the platform of the NEW FREEDOM, WOODROW WILSON sought to preserve political and economic liberty in the United States through various legislative and executive initiatives. In particular, Wilson opposed the consolidation and abuse of economic power that had increasingly occurred since the turn of the century. One of the main emphases of his administration was to prevent the further consolidation of economic power that curbed free competition and to increase the ability of individual producers and small businesses to compete.

Despite his focus on slowing the growth of economic power, Wilson remained fairly unreceptive to the demands of labor and of farm organizations during his first term. Both these groups had sought to protect the power of individuals against the consolidation of economic power by corporations. Despite his initial reluctance to directly aid unions and farmers, he relented on his opposition to pro-farm and pro-labor legislative initiatives as the 1916 election approached. Accordingly, President Wilson approved the Federal Farm Loan Act in 1916, which provided agriculture with the low-interest rural credit system long advocated by farmers and rural residents.

Although farmers had faced a shortage of capital, banking facilities, currency, and credit during the last two decades of the 19th century, the new century brought a wave of prosperity to rural areas of America that would last until shortly after the end of WORLD WAR I. During this "Golden Age" of agriculture, farmers tended to spend their newfound prosperity on consumer goods to improve their standard of living. However, many farmers, having witnessed the economic difficulties of the late 19th century, were hesitant to invest in capital improvements, whether in expanding their landholdings or in purchasing new technologies. The farm advocates long had championed the need for low-interest loans to help promote and make affordable the capital improvements needed to expand individual farms.

The Federal Farm Loan Act created the mechanism to extend low-interest loans for periods of five to 40 years to farmers through the control of a Federal Farm Loan Board. The board was comprised of 12 Federal Land Banks that paralleled the Federal Reserve Banks. As part of Wilson's New Freedom initiative, the Federal Farm Loan Act extended capital to farmers through a program that cut out private banks, which long had been viewed by farmers as outside institutions that easily exploited vulnerable farmers.

**federal income tax (1913)**

The United States has had a long history of local and state income taxes. The majority of the states in the Union experimented with one form of income tax or another long before the first federal income tax was levied. By 1910, 20 states had income tax laws on their books. Income taxation at the federal level, however, was a more hotly contested issue. During the War of 1812, the Congress considered the idea of a federal income tax. Due to the relatively short duration of the war, it did not act upon this. During the Civil War, however, the financial needs of the Union were so acute that a federal income tax provision was adopted as an emergency war measure. This first federal income tax, adopted in 1862, was a moderate tax levied on a small portion of the population. The temporary nature of the measure became apparent in 1872 when it was repealed. The repeal of the statute did not mark the end of the debate. It marked the beginning of a half-century-long struggle over the readoption of a suitable federal income tax.

During nearly every session of Congress in the post-Civil War era, representatives from the South and West proposed new federal income tax bills. During the depression of 1893, southern and western Democrats finally succeeded in passing the Wilson-Gorman Tariff. It marked the first national, nonwartime, direct tax on the incomes of American citizens and corporations. The Supreme Court voided portions of the act the following year by declaring that aspects of the federal tax were unconstitutional. In 1894, the Supreme Court expanded its position on the constitutionality of a direct income tax when it declared in *Pollock v. Farmers' Loan and Trust Company* that a direct income tax was a breach of the constitutional provision that direct taxes must be apportioned among the states according to population. Leaders in the DEMOCRATIC PARTY claimed that the Supreme Court's decision was judicial usurpation aimed at protecting those with wealth and privilege. This criticism provided southern and western Democrats with a means not only of attacking the Supreme Court, but also for challenging the REPUBLICAN PARTY, which controlled the other two branches of government.

As a result of this partisan struggle, the idea of a federal income tax became a plank in the Democratic Party's 1896 election platform. The tax began as a political maneuver used by the Democrats to challenge the Republican Party's dominance. The Democrats, supported by opponents of the tax who believed that they could derail the tax with its own momentum, helped to put forward the bill as an

amendment to the constitution. The opponents who signed onto the bill miscalculated. Both the Senate and the House of Representatives passed the law in 1909, which allowed for the taxation of citizens in accordance to their income.

After four years, the amendment was ratified by the states and became law. The Federal Income Tax became the Sixteenth Amendment to the Constitution of the United States. The amendment, which began as a partisan struggle, took on a life of its own. The Democrats who supported it championed the bill as a means of achieving social justice. The revenue that the government would collect from the tax was viewed by many of its supporters as an afterthought. The law, however, became extremely important during WORLD WAR I. The ratification of the amendment provided the government with needed revenue to finance the war effort. It also created a model for financing government activities for generations to come.

In addition to the political maneuvering that was required in making the amendment a reality, there were a number of challenges to making the income tax practical. The first challenge was how to define what exactly would be taxed under the law as income. The next step was to determine how much each individual would be taxed. The creators had to weigh advantages and disadvantages to individuals as well as the economic well-being of the country in general. They decided upon a progressive income tax that would tax those with a higher income at higher rates. Politically, it satisfied all but the most zealous Democrats. These radical Democrats wanted to use the tax to aid in restructuring a classless society. Economically, it won the support of the most prominent economists of the time.

The Sixteenth Amendment for a federal income tax proved to be much more than a political victory for the minority party trying to establish its supremacy. It established the means necessary for the U.S. government to take a much more active role in the development of American life and commerce.

### Federal Reserve Act (1913)

After a century of political struggle over the government's role in banking and currency, the Federal Reserve Act of 1913 settled the question by establishing a national network of banks in aid of the monetary system. Despite much acrimonious debate about the supply of money in the economy throughout the late 19th century, the CONGRESS had not instituted any large-scale reforms to change the banking

and financial structure of the nation since the time of the Civil War. The crisis over the supply of money and its relationship to the nation's economic well-being was once again highlighted by the Panic of 1907. Banking reform became one of the major issues addressed by progressive reformers and politicians.

As one of the principal concerns of WOODROW WILSON during his first term as president, banking reform had strong support from both aisles of Congress. Unlike many other areas of reform that divided Democrats and Republicans, both parties favored the need for greater federal regulation of banking and the supply of currency as a key to preventing future economic panics or depressions. As national debate turned to restructuring and regulating banking, much concern was voiced about whether public or private concerns should have the leading influence in any new agencies created by federal legislation.

In 1913, Wilson assumed leadership over this issue and pushed through Congress the Federal Reserve Act, perhaps the most significant piece of legislation signed by Wilson during his first administration. The principal aim of this legislation was to control the supply of money in circulation by creating a federal agency charged with regulating interest rates. With its ability to determine the rate at which private banks could borrow money from the government, the Federal Reserve was able, by this legislation, to either expand or deflate the availability of money in the nation's economy. To control this process, the Federal Reserve Act established 12 regional banks. All private banks in the United States were required under this legislation to deposit an average 6 percent of their assets in their regional Federal Reserve Bank. These deposited funds were then used to make loans to member banks and to issue paper currency, or Federal Reserve notes, that facilitated financial transactions. When market conditions shifted in one region, regional banks were empowered to raise or lower interest rates in order to provide a quick response to sudden changes in credit demand.

To respond to public pressure that banking reform reflect the needs and concerns of the public and not just that of private bankers, the Federal Reserve Act charged the president with appointing a Federal Reserve Board that was responsible to the public, not the banking industry. The board set policy and administered the activities of the 12 regional banks. Although the Federal Reserve Act stands as a major achievement of the Wilson administration, it reflected the philosophical shift in Wilson's thinking from the time of the 1912 presidential campaign to the policy initiatives of his first administration. During the campaign, Wilson had pledged to use the federal government to break up the power held by large industries. Within the Federal Reserve System, he in effect consolidated bank power.

While the Federal Reserve Act did a great deal to strengthen the financial health of the American economy, it did precious little to break the concentration of banking that had emerged in the late 19th century. With the collapse of the U.S. (and world) economy in 1929, the Reserve fell under attack for failing to prevent the onset of economic crisis. In general, Wilson had crafted the Federal Reserve system in a way that worked with large banks, rather than attempting to break them up. Much of the thinking and impetus behind this legislation had been to create a mechanism that could stave off economic crisis. Although during the 1990s, the Federal Reserve skillfully oversaw the largest expansion of the American economy, in the 1920s it was not as successful. Accordingly, the legislation seemed more in line with the thinking of Theodore Roosevelt's NEW NATIONALISM that Wilson had campaigned against in 1912.

—David R. Smith

### Federal Trade Commission Act (1914)

The Federal Trade Commission Act of 1914 laid the foundations of government regulation of trade and commerce by creating a commission to collect information on prices, competition, and trade. In response to the consolidation of economic power among corporations, monopoly and unfair trade practices became central issues of progressive reform. They also became major points of conflict in the presidential election of 1912. Of the four major candidates in 1912, three advocated progressive reforms to address the growing power of corporations. The socialist candidate, EUGENE VICTOR DEBS, argued that the federal government should assume ownership of the trusts. For the other primary candidates, THEODORE ROOSEVELT, WILLIAM HOWARD TAFT, and WOODROW WILSON, this solution was unacceptable. Despite their unity in rejecting socialist ideas, Wilson and Roosevelt clashed during the 1912 campaign over their respective plans to address the trust issue in the American economy. Running on the PROGRESSIVE PARTY ticket, former president Theodore Roosevelt advocated a NEW NATIONALISM that would strengthen the federal government. The reinvented government would create powerful government agencies that regulated and, when necessary, limited the power of trusts.

In contrast, the Democratic candidate, Woodrow Wilson, found the proposal to strengthen the federal government to be a threat to state governments. Accordingly, his proposal did not call for stringent regulation, but rather for the government to actually break up the trusts. Wilson

contended that the monopolies created by various trusts undermined the competition and commerce that had been responsible for much of the economic prosperity of the nation since the last century. While the federal government would be empowered and, accordingly, strengthened to dismantle the trusts, it would be only a temporary arrangement, ending the concentration of economic power in the hands of the few. Once this objective was achieved, Wilson insisted that the federal government would relinquish these new powers. Wilson presented these ideas to the American public during the 1912 campaign as the NEW FREEDOM that would restore economic opportunity to the people.

Despite making the pledge to break up the trusts during the 1912 campaign, Woodrow Wilson ultimately deviated from that position after assuming the office of the president in 1913. Two initiatives—banking and anti-trust—became the core of his progressive reform agenda during his first term in office. In 1914, Congress passed the Federal Trade Commission Act, which created the federal agency by that name. The Federal Trade Commission (FTC) was empowered to collect information on corporate pricing procedures and competition between companies. Wilson eagerly signed the Federal Trade Commission Act into law, declaring that the breakup of large-scale industry was no longer practical for the American economy. Instead, he now fully embraced Theodore Roosevelt's position that large industry was an inescapable aspect of 20th-century America and that the proper role for government would be to regulate industry through government agencies. Despite wide powers of investigation, the FTC was left without any significant enforcement mechanism as Congress stripped its companion legislation, the CLAYTON ANTITRUST ACT, of the power to break up trusts. The Federal Trade Commission, like other Progressive Era reforms, only partly addressed economic consolidation issues of the period.

### Fellowship of Reconciliation

The Fellowship of Reconciliation (FOR) grew out of European Christian pacifists' concern about war in Europe in 1914. Once war broke out, pacifists met in Cambridge, England, to formalize earlier pledges to advocate for peace and oppose war. Viewing war as a social evil, FOR was founded as an interfaith organization dedicated to promoting international cooperation among groups and individuals to develop alternatives to armed conflict. It quickly spread to the United States and throughout the world.

In 1915, the American branch of FOR was established with the help of British Quaker and FOR cofounder Henry Hodgkin. The organization's early activism in the United States focused on gaining rights and recognition for the small but significant number of conscientious objectors (COs). The group pressed the government for alternative service for those who had a religious or moral reason to oppose war but who lacked affiliation with the established religious denominations such as the Quakers. John Nevin Sayre, an early leader of FOR, lobbied President WOODROW WILSON to protest the treatment of those arrested under the ESPIONAGE ACT or for evasion of or opposition to the military draft. FOR further worked on behalf of COs to improve the harsh prison conditions during the war. FOR's activism on this issue paved the way for the post-war amnesty campaign and later legal recognition of and greater rights for COs during World War II. In the 1920s, the fellowship supported various activities of the PEACE MOVEMENT, and its press published the influential journal, *The World Tomorrow*, which sought to promote international cooperation and peace and to provide information on world cultures and political conflicts. During World War II, FOR protested the internment of Japanese Americans, condemned saturation bombing campaigns and, after the war, spoke out against the use of atomic weapons.

Although FOR's primary focus was eradicating war, the organization believed that fighting for other social causes such as labor rights and civil rights was equally important. The fellowship helped to establish Brookwood Labor College in 1918 and aided in the defense of labor activists. During the 1919 textile strike in Lawrence, Massachusetts, A. J. Muste and FOR's Boston chapter supported the strike. On the basis of his reputation for promoting nonviolent protest, Muste served as executive director of FOR between 1940 and 1953 and later counseled Martin Luther King, Jr., during the Southern civil rights campaigns of the 1950s and 1960s. On civil rights, FOR cooperated with the Congress of Racial Equality (CORE) in a pioneering interracial sit-in in 1943. When civil rights protests began in earnest in the 1950s, FOR provided leadership-training in the principles of nonviolence. James Lawson of FOR held nonviolence workshops in Nashville for young students protesting segregated public facilities.

At the same time that the United States was galvanized by the civil rights movement, the American government was waging war in Vietnam. FOR was an early opponent of the war, advocating negotiations, organizing interfaith visits to Vietnam, and raising money for medical aid to that country. It later promoted draft refusal counseling and participated in fasts and political campaigns for American withdrawal. During the 1960s, FOR also began highlighting the connections between war and environmental damage, as the war in Vietnam so dramatized. This linking of war-related

issues exemplified FOR's longstanding approach to anti-militarism. In addition to opposing the Vietnam War, FOR opposed nuclear arms as a tool of American foreign policy and international diplomacy. Promoting détente between the superpowers, FOR coorganized the Nuclear Freeze Campaign of the 1980s. After the end of the cold war in the late 1980s, FOR lobbied for reducing high military expenditures in the United States and helping victims of armed conflict in places such as Iraq and Bosnia.

**Flynn, Elizabeth Gurley** (1890–1964) *labor activist, Communist Party official*

During the Progressive Era, the growing power of the NEW UNIONISM in the workplace and the sustained influence of SOCIALISM in the labor movement created a new context for working-class activism. An important part of that activism involved working women in mass production industries and the new turn in the WOMAN SUFFRAGE movement, which dedicated itself to recruiting women workers and to improving their working conditions. Into this context emerged a new generation of women labor activists who captured the imagination of both the mainstream and the RADICAL AND LABOR PRESS. One such figure was Elizabeth Gurley Flynn.

Born in 1890, Flynn was the daughter of Thomas and Annie Gurley Flynn, Irish-American socialists. In her early adolescence, Elizabeth Flynn's father took her to rallies to hear speakers and learn socialist principles. In 1906, she gave her first public speech and thereafter became a frequent speaker for socialist and labor causes. In 1907, she met John Archibald Jones, an organizer from the Mesabi Iron Range, and married him the next year. Flynn gave birth to her second and only surviving child, Fred, in 1910. Flynn's desire to remain active led to her separation from Jones, and he divorced her in 1920.

Active as a speaker and organizer for the INDUSTRIAL WORKERS OF THE WORLD (IWW), Flynn engaged in several important labor struggles of the day. She participated in FREE SPEECH FIGHTS in Missoula, Montana, and in Spokane, Washington. In 1912, Flynn helped to coordinate the LAWRENCE STRIKE with IWW's WILLIAM DUDLEY HAYWOOD, Arturo Giovannitti, and Joe Ettor. During the strike, Flynn, along with MARGARET SANGER, organized families to send their children to supportive families in New York. The violent response of the police to the children's exodus built public sympathy for the strike. Flynn reacted strongly and publicly to the poverty, illness,

Elizabeth Gurley Flynn (Library of Congress)

and deprivation of workers in an age when industry was largely unregulated. She knew that labor violence did not stop at the factory door or even the picket line. Her courage in these early battles earned the admiration of IWW songster Joe Hill, who wrote a song in her honor. As Hill's "Rebel Girl," Flynn carried the banner of women's emancipation within the IWW, and she spoke out in support of BIRTH CONTROL. Throughout her life, she worked for the dual causes of labor and the equality of women.

Flynn's personal life was rocky. Once separated from her husband, she became involved with mercurial IWW organizer Carlo Tresca. They lived together in New York for 10 years. She left him in 1925. After joining the COMMUNIST PARTY (CP) in 1926, Flynn took ill. A physician, Marie Equi, took care of Flynn, and the two women lived together in Portland, Oregon, for 10 years. She returned to New York in 1936 to become active once again, this time in national communist politics. In the 1950s, she was put on trial under the Smith Act and convicted. She served two years in Alderson Prison.

For the rest of her life, she fought for the working class under the communist banner. As one of the few well-known women in the party, Flynn became a member of the national committee and helped to set party policy. Despite its residual sexism, the CP offered women the opportunity to be politically active and committed itself, at least

on paper, to discussing the "woman question." For Flynn, however, the issues of gender equality came second to the class struggle. Through her life, she would give priority to the agenda and issues of the Communist Party and only secondarily to the women in that party. She died in 1964.

### Foraker Act (1900)

The Foraker Act, also known as the Organic Act of 1900, established a civilian government on the island of Puerto Rico, formerly a Spanish colony, which became a U.S. possession after the Spanish-American War. Named for its sponsor, Ohio senator Joseph Benjamin Foraker, the law created a territorial government with a governor and executive council appointed by the American president, a popularly elected House of Representatives, and a system of courts. It also established a new, nonvoting Resident Commission of Puerto Rico in Congress. The first civilian governor of Puerto Rico, Charles H. Allen, was inaugurated in 1900. The Foraker Act also mandated that federal statutes and regulations were in effect in Puerto Rico, but the inhabitants of the island were citizens of Puerto Rico, not the United States. They had neither the rights nor the privileges of American citizens. Legally, the island was not incorporated into the United States, and the clauses of the U.S. Constitution on citizenship and taxation did not apply to its citizens. The status of Puerto Rico and other territories was defined as outside constitutional protections; the SUPREME COURT upheld this definition of Puerto Rico's status in the landmark Insular Cases.

There were many reasons for the special status of Puerto Rico and other territorial possessions that the United States acquired after the Spanish-American War. First, 40 percent of the Puerto Rican population was nonwhite. Moreover, they spoke Spanish, not English, as their primary language. Second, opposition to the Spanish-American War, while it did not prevent the United States from going to war, generated constraints on how the United States governed its new possessions. Because many Americans were ambivalent about U.S. expansionism and opposed to open IMMIGRATION, they saw the integration of Puerto Rico into the United States as a real threat to American culture.

It would not be until 1917 that the citizenship status of Puerto Ricans changed. In that year, the Foraker Act was replaced by the JONES ACT (1917), which granted Puerto Rican inhabitants U.S. CITIZENSHIP and made them eligible for the rights and duties of American citizens, including the obligation to pay taxes and eligibility for military conscription.

**Ford, Henry** (1863–1947) *industrialist*

Henry Ford's introduction of the Model T Ford automobile and his innovations in assembly line production fundamentally transformed American society. Born in Dearborn, Michigan, in 1863, Ford displayed a genius for mechanical innovation at an early age. Ford moved to Detroit when he turned 16 and began working as an apprentice in a machine shop. In the 1890s, while working for the chief engineer for the Detroit Edison Company, Ford began experimenting with an internal combustion engine. He built his first automobile in 1896 and sold it to raise money to build more. In 1899, he secured enough financial backing to create the Detroit Automobile Company, which later became the Henry Ford Company. During these early years, Ford frustrated many of his backers when he insisted that his automobile was not yet ready for sale to the public. Frustrated by these disputes, he left the company, which later became the Cadillac Motor Car Company. In 1903, he created the Ford Motor Company.

Ford's first automobile, the Model A Ford, was well-built, relatively inexpensive (at \$850 it was among the least expensive automobiles on the market), and sold exceptionally well. By 1904, Ford had sold 1,700 of the Model As and had established himself as one of the leading manufacturers in the city. Ford's rise to prominence, however, was almost derailed before it began. His reluctance to push his early models into production had alienated many of Detroit's wealthiest financiers and manufacturers. When Ford introduced the Model A, Ford was taken to court because he was not a licensed manufacturer. Other licensed automakers charged that Ford had violated the 1895 patent given to George Baldwin Selden, an early innovator. Ford finally won the suit on an appeal in 1911. Ford's commitment to manufacturing good quality, inexpensive automobiles, along with his decision to fight wealthy manufacturers in Detroit and their financial backers, made him a popular figure with many ordinary citizens.

Not content to have only a minority share of the automobile market, Ford announced in 1908 that he was going to build a durable, inexpensive car that would enable ordinary citizen to enjoy the benefits of automobile transportation. Although critics scoffed at the idea that automobiles could be mass-produced, the Model T Ford was released in March 1908 and became an instant success. The Model T featured top-of-the-line engineering and construction but

no frills. Priced at \$850, Ford boasted that no car offered more for less, and the American public agreed. Between its introduction in 1908 and its discontinuation in 1927, Ford sold 15 million Model Ts.

The early success of the Model T convinced Ford that he could in fact sell an automobile to every family in the country. In order to do so, he had to make them even cheaper and faster. Ford concluded that MASS PRODUCTION would be the key. The more Model Ts he produced, the cheaper he could sell them. Building on the SCIENTIFIC MANAGEMENT ideas introduced by FREDERICK WINSLOW TAYLOR, Ford created an intricate assembly line for the production of the Model T and set about to integrate every aspect of the car's production. Ford realized that his current facility was not capable of housing a fully integrated assembly line, and so in 1910 the company moved its operation to the newly designed Highland Park plant. Built by architect Albert Kahn, the plant was a massive complex, complete with state-of-the-art

Henry Ford (Library of Congress)

machinery. With the opening of the Highland Park Factory, Ford created a revolutionary process, in which every step of the Model T's production had been automated. The Model T's production time dropped from 728 minutes to a remarkable 93 minutes. The result was that Ford was able to mass-produce the Model T, further reduce the car's cost (in 1927, only \$290), and maximize profits. By 1921, Ford controlled 55 percent of the automobile industry and had a net annual income of \$78 million.

In 1914, Ford was in the national spotlight when he announced that all Ford employees would be paid the incredible amount of \$5 a day for an eight-hour workday. At the time, industrial employees were averaging only \$11 a week, and they often worked more than nine hours a day. Praised by some and denounced by others, Ford insisted that keeping skilled and loyal employees was essential to maintaining his rigorous production schedule. Knowing the value of their skills, craft workers were frequently late for work or simply moved from job to job. Ford's decision to pay his employees such a handsome wage was not motivated by a commitment to humanitarianism, but rather by a desire to homogenize and discipline his employees. He provided many of his employees with affordable housing but also insisted that they learn how to speak English, refrain from consuming alcohol, and become upstanding American citizens. Ford created a Sociological Department to investigate how his employees lived. The company also withheld part of a worker's \$5 a day wage if he was late or did not fill her production quota. Part of the withheld money could be retrieved if workers agreed to meet the demands of the Sociological Department. Ford's personal beliefs also were highly controversial. In 1918, he purchased the *Dearborn Independent* and published a series of articles attacking Jews. Finally, Ford regularly employed company police and spies to intimidate employees; and until the 1940s, his company vigorously opposed attempts by employees to form a union.

The innovations introduced by Ford helped transform the country, while throughout the world Ford's achievements with the new assembly-line production methods became identified as "Fordism." Widespread ownership of the automobile helped spread the construction of goods roads and the expansion of cities. Over the next several decades, the automobile changed virtually everything about American society. In addition, the introduction of mass production, the assembly line, scientific management, and corporate paternalism changed the very nature of American industry.

### Fordney-McCumber Tariff (1922)

With the return of Republican control to the White House in 1921, President WARREN G. HARDING's administration set about to restore many traditional Republican policies, such as tax cuts and higher protective tariffs. President Harding's secretary of the treasury, ANDREW W. MELLON, strongly advocated that both these policies be adopted shortly after the new administration entered office. In particular, WORLD WAR I had allowed the chemical and metal industries to develop a number of innovative technologies. Industry leaders, along with Mellon, argued for a higher protective tariff to allow them further time to develop these advantages. The Fordney-McCumber Tariff of 1922 increased tariff rates on chemical and metal products as a safeguard against the revival of German industries, which had dominated these sectors of the international economy prior to the outbreak of hostilities in Europe in 1914.

The imposition of a new protective tariff in the United States had far-reaching consequences previously unimagined by the federal government. In particular, while the United States had been a debtor nation prior to the war, it emerged from the war as a creditor nation. As a result, the international economy increasingly depended upon U.S. capital for its economic development. European nations and their citizens owed some \$13 billion to the United States at the end of the world war. Moreover, the United States steadily made additional foreign loans and investments in the postwar period. The need to make loan repayments in U.S. dollars meant that the international community had a real need to be able to export its products to the United States in order to receive an influx of dollars that could be used to make the necessary payments on their loans. The Harding administration was adamant that European nations needed to repay all of their debts from the war. Consequently, the need for an open trade system became more and more apparent.

The return of a protective tariff to the United States often priced foreign goods out of the American economy. Although not the only factor, the protective tariff imposed by the United States in 1922 contributed to the extremely difficult economic conditions that Europe faced as a result of shifting economic power in the international community and the heavy reparations that constructed the German economy. Clearly, the First World War had altered the position of the United States in the international economy, and its economic policies would no longer affect only domestic conditions, but would also have implications that extended well beyond its own borders. The Fordney-McCumber Tariff, like the Hawley-Smoot Tariff that followed in 1930, contributed to world economic crisis in the 1930s.

## foreign policy

The victory of the United States in the war with Spain in 1898 was a turning point in American foreign policy. Until 1898, American officials thought that their government should stay out of foreign entanglements, and they restricted expansion to territories on the North American continent. By the late 19th century, however, American presidents argued that the country needed to expand into foreign territories to search for new markets. At the turn of the century, the United States reorganized its military system and built up its naval power to ensure access to foreign markets and to meet the needs of the expansion of American capitalism and culture. Although 80 percent of American exports went to Europe and Canada in the late 19th century, the United States competed with the great industrial powers for markets in Asia and Latin America.

Leaders in the United States used two reasons to justify the expansion of American capitalism and culture around the world. First, the American business community had reached a consensus that, by expanding into foreign markets, the country could solve its economic, social, and political problems that stemmed from the Industrial Revolution. Second, American leaders increasingly believed that the country needed strategic naval bases to compete with European countries in Asia and Latin America. Alfred Thayer Mahan's *The Influence of Sea Power upon History* (1890) had a significant influence on American elites. Mahan had argued that the United States would need naval supremacy and control of the seas to maintain its national power. His theories inspired the GREAT WHITE FLEET as a policy tool under THEODORE ROOSEVELT.

The Spanish-American War of 1898, which began as an intervention for humanitarian reasons in a civil war in Spanish Cuba, became a contest for colonial expansion. After the United States took possession of the Philippines in the war with Spain, a revolt broke out against the new colonial power under EMILIO AGUINALDO. Although Americans saw themselves differently than the previous European imperial rulers, the United States found that subjugating other people required military force and brutality. After four years of fighting, 4,300 Americans had died and about 50,000 Filipinos were killed in the Philippine War. By 1902, American troops under JOHN PERSHING finally suppressed the Philippine insurrection.

The American presence in Asia increased with the acquisition of the Philippines. In particular, the U.S. admin-

istration sought to expand trade with China. At the turn of the century, the major European and Asian powers had begun to carve up China in a rapid imperialist expansion. Wanting to protect American interests in China, President William McKinley stated in 1898 that, although the United States sought no special advantages, he encouraged the European and Asian powers to maintain an "open door" in China. Secretary of State John Hay translated McKinley's message into the Open Door notes, addressing it to England, Germany, Russia, France, Japan, and Italy. The major powers ignored the OPEN DOOR POLICY until the United States participated in an international expeditionary force that suppressed the nationalist BOXER REBELLION in China. England and Germany agreed to abide by the Open Door policy after the rebellion was crushed in 1900.

Although the United States won the war with Spain and acquired Cuba, Puerto Rico, and the Philippines, the war illustrated obvious inadequacies in the American ARMED FORCES. President McKinley appointed Elihu Root, a corporate lawyer from New York, as secretary of war to reorganize the entire military system. Between 1900 and 1903, Root transformed the military system into a modern one. The reforms enlarged the regular army, established federal army standards for the National Guard, created officer training schools, and organized a central planning agency to coordinate military operations.

The United States assumed a more active role in international affairs between 1901 and 1917. Theodore Roosevelt became president after McKinley was assassinated in 1901. Roosevelt brought stability to Asia and won the Nobel Peace Prize in 1906 for his efforts at negotiating the Treaty of Portsmouth, which ended the RUSSO-JAPANESE WAR of 1904–05. He also agreed to the Japanese presence and territorial status quo in the Pacific under the ROOT-TAKAHIRA AGREEMENT of 1908.

Despite his work as a peacekeeper, Roosevelt extended American military power and dominance in the Western Hemisphere. In 1904 the president added the ROOSEVELT COROLLARY to the Monroe Doctrine. He claimed the right to intervene in the domestic affairs of Latin American countries if they were not able to maintain order themselves. This policy expanded on the right under the Monroe Doctrine of the United States to oppose European intervention in the region. Using the Roosevelt Corollary, the United States intervened in the Dominican Republic when the country was unable to make payments on its \$22 million debt. In 1905, the United States took control of the nation's finances for three decades.

The United States intervened in other Caribbean countries as well. In exchange for granting Cuba independence, the United States required that the country put the Platt Amendment of 1901 in its constitution, which maintained

the right of the United States to intervene in Cuba to prevent a foreign power from having undue influence there. In 1903 Roosevelt prevented the Colombian government from suppressing a revolution in its province of Panama. Immediately after Roosevelt recognized the independent nation, the Panamanian government agreed to a PANAMA CANAL treaty. In 1911, three years before construction of the canal was completed, Roosevelt had claimed, "I took the Canal Zone and let Congress debate."

Roosevelt's successor, WILLIAM HOWARD TAFT, attempted to preserve the economic interests of the United States in the world. Using policies termed as DOLLAR DIPLOMACY, Taft's secretary of state, Philander C. Knox, worked to extend American investments throughout the world. The value of American exports increased from \$800 million in 1895 to \$2.3 billion in 1914, an increase of close to 240 percent. Taft resorted to military force when economic influence proved insufficient. In 1909, when revolution broke out in Nicaragua, the Taft administration sent troops to support the government's opponents and to seize the country's customs houses. Two years later, Taft sent troops to Nicaragua again to protect the pro-American government. The American troops occupied the country for over a decade.

When WOODROW WILSON entered the White House in 1913, he continued the interventionist policies of earlier presidents. Although Wilson opposed dollar diplomacy, which he thought forced weaker countries into inequitable financial relationships, he agreed with the importance of promoting economic development overseas. In addition,

Frank Kellogg defending U.S. intervention in Nicaragua before the Senate Foreign Relations Committee; chairman of the committee Senator William E. Borah is on the left (*Library of Congress*)

he sought to conduct a foreign policy that followed democratic principles. In particular, he wanted to extend constitutional liberty to the country's neighbors in Latin America. Having taken control of the Dominican Republic's finances in 1905, the United States set up a military government there in 1916. Wilson sent the U.S. Marines to Haiti in 1915 to crush a revolution, and American troops occupied that country until 1934.

In 1914 Wilson sent troops to the Gulf of Mexico port of Veracruz after the Mexican army had arrested American sailors who had gone ashore in Tampico. Wilson expected to establish a pro-American government in a bloodless intervention, but the two countries came to the brink of war. Nineteen Americans and 126 Mexicans were killed in skirmishes, and the Wilson administration backed off. When the military intervention helped to strengthen the position of Venustiano Carranza, the United States decided to back the opposition led by Pancho Villa. However, when Villa appeared to be losing the power struggle, the United States abandoned him and granted preliminary recognition to the Carranza government. To retaliate, Villa killed 16 Americans on a train in northern Mexico; later his forces crossed the border into Columbus, New Mexico, killing 17 more Americans. Wilson then ordered an expeditionary force into Mexico to find Villa. Although the U.S. troops never found Villa, the two countries engaged in battles that killed 40 more Mexicans and 12 Americans. The United States finally withdrew its troops and formally recognized the Carranza government in 1917.

In the 1920s the U.S. government encouraged economic expansion in Latin America. Between 1924 and 1929, U.S. investments more than doubled in Latin America as the U.S. military maintained a presence in several countries there. At the same time that the United States intervened in the affairs of Latin American countries, public opinion wanted to sustain American NEUTRALITY in the European conflict.

When WORLD WAR I broke out in Europe, the United States attempted to stay neutral. However, as British and German warfare gradually restricted American trade and freedom of the seas, President Wilson became involved in the conflict. When the British imposed a naval blockade on Germany, the United States was able to withstand an interruption of its trade with the Central Powers (Germany, the Austro-Hungarian Empire, and the Ottoman Empire); but abiding by any embargo of the Allies (Britain, France, Italy, and Russia) would harm the U.S. domestic economy, especially when war orders increased dramatically from Britain and France after 1914. Defense production helped to bring about one of the most expansive economic booms in American history.

By 1915, the United States had sided with the Allies by supplying them with war materials. Meanwhile, the

Germans resorted to a new tactic, submarine warfare, to cut off the flow of supplies to England. A German submarine sank the British passenger liner, *LUSITANIA*, on May 7, 1915, killing 1,198 people, 128 of whom were Americans. After the incident, the Germans agreed to Wilson's demands that the Central Powers affirm their commitment to neutral rights and promise not to launch more attacks.

By 1917, the Germans had decided that the advantages of unrestricted submarine warfare outweighed the risk of American entry into the war. By then, Wilson had concluded that, if provoked to enter the war, the United States could use the war as a means of creating a new democratic world order. In a speech to the Congress in January 1917, Wilson presented a plan for a postwar order and "peace without victory." The United States would help to maintain peace through a LEAGUE OF NATIONS, a world organization of nations that would arbitrate conflicts and ensure the self-determination of nations.

Meanwhile, a number of events made American entry into the war nearly inevitable. In February, the British gave Wilson an intercepted telegram from the German foreign minister to the Mexican government. In the ZIMMERMANN TELEGRAM, the foreign minister proposed that the Mexicans ally with the Germans if the United States joined the war. In exchange, when the war was over, Mexico would reacquire Texas and much of the American southwest. Publication of the telegram helped to create popular support in the United States for entry into the war.

In the following month, a republican government replaced the czarist regime in the RUSSIAN REVOLUTION. When the Bolsheviks took control in the October Revolution of 1917, Wilson refused to recognize their new government. Diplomatic relations between the two countries were not restored until 1933. The possibility—and eventual reality—of Russia withdrawing from the war put additional pressure on the Wilson administration to join the Allied war effort.

In April 1917, the United States entered the war as an ally of Britain. Within months of the arrival in 1918 of American troops in Europe, Germany agreed to an armistice. By the time war had come to a close, the European population and economy were decimated. In contrast, the United States emerged from the war relatively unscathed and as a global power; and the nation's economy experienced an industrial boom that stretched into the 1920s.

The TREATY OF VERSAILLES, which formally ended the war, differed significantly from what Wilson had hoped for. He was unable to win approval for most of his proposals, such as freedom of the seas, free trade, and the principle that the negotiations should result in "open covenants openly arrived at." The Paris agreements were negotiated in secret. Rather than gaining support for the "impartial mediation" of colonial claims, Wilson had to accept a trans-

fer of German colonies in the Pacific to Japan, which Britain had promised in exchange for Japanese help in the war. In addition, the economic and strategic demands of the Allies undermined his promise of "national self-determination" for all peoples.

The major difference between the American and Allied agendas for peace was the demand that the Central Powers pay reparations to the Allied governments to compensate for their losses. Wilson opposed the idea. When the Allies refused to compromise, he reluctantly accepted the principle of reparations. A commission in 1921 determined that Germany had to repay \$56 billion to the Allies. Germany eventually paid only \$9 billion, but the amount was still far more than the decimated economy of Germany could afford.

Although the treaty was far from Wilson's hopes for peace based on the principles of justice and democracy, it provided for a League of Nations, which Wilson believed would create a new international order. Even though Wilson lobbied passionately for the passage of the treaty, the Senate refused to ratify it. Its defeat at the hands of Senator HENRY CABOT LODGE and other Republicans signaled an end to Wilsonian internationalism.

Having rejected Wilsonian diplomacy and its promises of a new world order, the United States retreated from European affairs for two decades after World War I. In a policy of what historian Joan Hoff Wilson has called "independent internationalism," American policymakers in the 1920s hoped to create protective measures against future wars without restricting the nation's freedom of action in the world. When WARREN G. HARDING took office, Secretary of State CHARLES EVANS HUGHES secured a series of agreements at the WASHINGTON CONFERENCE ON NAVAL DISARMAMENT of 1921–22 from the major European and Asian powers to curb the destabilizing naval arms race. In 1927, the major powers attempted unsuccessfully to extend the disarmament measures of the Naval Disarmament conference in Geneva. In 1928, 62 nations signed onto the KELLOGG-BRIAND TREATY, which outlawed war. Unfortunately, these peace and disarmament measures contained loopholes and lacked enforcement measures so that they became meaningless.

Although the Kellogg-Briand Treaty was unenforceable, it was seen as a victory for the peace movement, which had come together as a loosely organized coalition. The most active groups included the World Peace Foundation, the Foreign Policy Association, the Woodrow Wilson Foundation, the Council on Foreign Relations, the League of Nations Non-Partisan Association, the CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE, the Social Science Research Council, and the Institute of Pacific Relations. Having a significant influence on foreign policy, the members of these organizations included

mostly American elites who shared a vision of Wilsonian internationalism, a liberal new world order, and collective security. In fact, James T. Shotwell, a professor at Columbia University who headed the Carnegie Endowment, had helped to develop the Kellogg-Briand Treaty of 1928. Meanwhile, other groups that lobbied for the outlawry of war but emphasized pacifism rather than collective security, included the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM (WILPF) and the Fellowship for Christian Social Order. While the members of the pacifist groups were skeptical of the potential for peace, most of them supported a Christian pacifism.

Even though the United States retreated from the Wilsonian vision of a new world order in the 1920s, American policymakers sought to ensure the economic redevelopment and stability of Europe, a continent devastated by World War I. The Allies had to repay \$11 billion in loans to the United States. In addition, the reparations Germany was required to pay the Allies under the terms of the Treaty of Versailles weighed down the German economy. In 1924, CHARLES GATES DAWES, an American banker and diplomat, negotiated an agreement among France, Britain, Germany, and the United States. American banks provided loans to Germany so that it could pay the reparations and invest in its economy. Meanwhile, Britain and France agreed to reduce the amounts of the reparations if the Germans made their payments. Debt repayment fueled American economic expansion in Europe until the international financial system broke down after 1929. However, the DAWES PLAN did not solve the economic troubles in Europe. In fact, the circular flow of debt repayments helped to destabilize international finance, one of several factors that brought on a world economic depression in the 1930s.

The political chaos around the world sparked by the Great Depression, and the rise of fascist governments and military regimes in Europe and Asia intent on territorial expansion, severely undermined the fragile international system created after World War I. These powerful international forces gradually pushed the United States to greater involvement in international affairs.

In 1929 President Herbert Hoover faced a looming international economic and political crisis. He attempted to protect American farmers from international competition by raising agricultural tariffs with the Hawley-Smoot Tariff of 1930. Rather than helping farmers in the United States, the tariffs, at the highest level in American history, only exacerbated the international economic crisis. Other governments retaliated by enacting their own trade restrictions, thus shrinking the market for agricultural goods from the United States.

By the time that Hoover left office in 1933 the international system had collapsed. The system of the 1920s that

failed had been based on voluntary cooperation among nations and a refusal by the United States to restrict its freedom of action by establishing international obligations. Continued investment and intervention in Latin America and the Caribbean were not seen as contradictory solutions but rather as protecting America's sphere of interest. Under the administration of Franklin Delano Roosevelt, the United States gradually moved from a position of isolationism to intervention in the European and Asian conflicts that culminated in World War II.

**Foster, William Zebulon** (1881–1961) *union organizer* William Z. Foster was a radical trade unionist and working-class activist in the first half of the 20th century. He created new forms of worker organization in mass production industries and served as general secretary of the COMMUNIST PARTY. Born to Irish immigrants in Taunton, Massachusetts, in 1881, Foster stopped attending school at the age of 10 when he apprenticed himself to a die sinker. After three years of apprenticeship, Foster traveled across the nation, working at various jobs. His experiences as a migrant worker led Foster to embrace the ideals of SOCIALISM. He joined the Socialist Party in 1901. For the rest of his life, Foster remained deeply committed to working-class movements and politics.

Foster participated in the INDUSTRIAL WORKERS OF THE WORLD's (IWW) free speech fight in Spokane, Washington, in 1909. As a result, he joined the IWW and became an organizer. Foster's political views and approach to organizing the working class changed dramatically when he visited Europe in 1911. After participating as the international representative for the IWW in an international labor conference in Budapest and observing the successful organizing of France's syndicalist labor federation (CGT), Foster returned convinced that the IWW needed to change its organizing strategy, "boring from within" the established trade unions of the AMERICAN FEDERATION OF LABOR rather than organizing competing unions. Unable to convince other Wobbly

leaders to champion his strategy, Foster left the organization in 1912. He formed a rival, the short-lived Syndicalist League of North America.

In 1914 Foster moved to Chicago to take a position as business agent for the Brotherhood of Railway Carmen. There, he began another campaign to convert the AFL into a syndicalist organization. In 1915 Foster became a general organizer for the AFL and founded the International Trade Union Educational League (ITUEL). The ITUEL's goal was to use education and propaganda to steer the AFL to a syndicalist position.

As WORLD WAR I erupted, Foster shifted his energies to organizing large industries. He proved to be an effective labor organizer by founding the Stockyards Labor Council (SLC), which served to align Chicago's many unions organizing in the yards and coordinate efforts to unionize meatpacking workers. His success in organizing the ethnically diverse and divided stockyard workforce led to new gains in wages and working conditions during the war, but employers would not extend union recognition to the workers. Racism, internal fragmentation, and employer repression, however, doomed the SLC; and by 1922 it disbanded. It would be more than 20 years before the meatpacking industry was unionized.

In 1918 Foster developed the National Committee for Organizing Iron and Steel Workers to organize the steel industry. Initial strikes in Gary, Indiana, and South Chicago proved successful. The STEEL STRIKE OF 1919 drew more than 350,000 workers into its ranks. Ethnic, racial, and skill divisions among workers, limited support from the American Federation of Labor, and severe business and government repression combined to undermine the strike and led to the collapse of the National Committee.

After these organizing setbacks, Foster shifted back to political and educational activities. In 1921 he headed to Moscow and attended the Red International of Labor Unions (Profintern) and joined the Communist Party. He also founded the Trade Union Education League, modeled after the ITUEL, with the aim of promoting syndicalism among trade union workers, which became an arm of the Profintern in 1923.

Foster quickly became one of the most important leaders in the American Communist Party. He ran as its candidate for president of the United States in 1924, 1928, and 1932. Yet, imprisonment, internal party factionalism, and a heart attack in 1932 led to Foster losing influence in the movement. In 1945 Foster reemerged as party leader, after his key rival, Earl Browder, was expelled from the party. Foster remained in this position until he retired in 1956. He died in Moscow in 1961. Although his political career in working-class politics had limited success, Foster's innovative approaches to organizing labor in the meatpacking and steel industries were later adopted by

the CIO, which successfully organized the nation's industrial workers in the 1930s.

### free speech fights

During the Progressive Era, the INDUSTRIAL WORKERS OF THE WORLD (IWW), or Wobblies, carried out a series of free speech fights to test the constitutional guarantees of free speech and free assembly from 1906 until WORLD WAR I. Twenty-one of the 26 major campaigns took place between 1909 and 1913. The speech fights targeted cities, primarily in the West, where public officials passed local ordinances banning and regulating speaking in public places. Since the IWW relied on soapbox oratory to agitate against employers, recruit members, and protest, the free speech struggles expanded into an effort to publicize local government attacks against the working classes and their rights.

The first free speech fight occurred in Missoula, Montana, over an ordinance banning street speaking. The most famous fight, however, erupted in Spokane, Washington, on November 2, 1909. It turned into a major publicity victory for the IWW. The fight erupted when Spokane's city officials passed an ordinance banning street speaking to prevent the IWW from publicly agitating against the practices of private hiring agencies. Wobblies had been organizing against employment agencies that charged temporary workers a fee to place them in remote jobs with employers that either did not exist or did not have a contract with the agency. As police began arresting speakers, the IWW press sent out a call for all available workers to come to Spokane and speak out against the ordinance. When a single worker stepped onto a soapbox and began reading the Bill of Rights, he was arrested. Another demonstrator would then take his place, begin reading the document, and be escorted to jail. More than 500 Wobblies were arrested in the first month. This practice continued until Spokane's local jail was filled to overflowing with demonstrators. The local government took extreme measures to defeat the agitators, including shutting down and raiding the local IWW newspaper, assaulting prisoners, and jailing agitators in cold and wet cells in the middle of winter. ELIZABETH

GURLEY FLYNN, pregnant at age 16, was among those who were abused in prison. Her plight was well-publicized and gained the protesters additional sympathy. On March 4, 1910, facing waves of Wobblies, expensive court costs, and overcrowded jails, the local government capitulated and withdrew the ordinance.

The free speech campaign in San Diego turned out much differently for the IWW. Using similar tactics, the IWW challenged a public ordinance that banned free speech in a 49-block region of the city, which encompassed “soapbox row,” ostensibly to keep traffic moving. Local authorities were prepared for the IWW. Despite more than 5,000 protesters converging on the city, San Diego had much more jail space than Spokane and used such tactics as spraying agitators with fire hoses, brutalizing prisoners, and tolerating vigilantism to discourage participants from joining the fight. Despite support from the Socialist Party and the Federated Trades of San Diego, the IWW could not put enough pressure on the local government and public opinion to force them to withdraw the ordinance. After three months, the free speech fight was called off. In 1913, protesters in the PATERSON STRIKE experienced a similar failure.

After the defeat in San Diego, the number of free speech fights dropped as the IWW’s leadership began to discourage the strategy. Nevertheless, the harsh reactions of local authorities and vigilantes to these fights, and the denial of seemingly basic rights to free speech and assembly in the absence of advocacy of violence, initiated broad-based efforts to define and protect free speech. Amos Pinchot and 31 other prominent progressive reformers petitioned President WOODROW WILSON to demand a congressional investigation. Progressive government officials such as George Creel tolerated IWW free speech activities in their local communities, which prevented speech fights from erupting. While the short-term consequences of the free speech fights had mixed results, the free speech campaigns of the IWW contributed to the broader struggle for CIVIL LIBERTIES in the Progressive Era.

## Freud, Sigmund (1856–1939) *scholar*

The Viennese doctor Sigmund Freud was one of the most influential thinkers of the 20th century. The founder of the new science of psychoanalysis, Freud developed a therapeutic method for treating disorders that had their origins in the unconscious. Freud’s psychological theories, which put new emphasis on early psychosexual development, became increasingly influential in the United States after 1910. They shaped the sexual revolution of the 1920s.

After Freud began his career as a research scientist in anatomy, he began studying the irrational, or “unconscious,” thinking that it could be studied with the same scientific rigor as anatomy. In 1886, he opened a medical office in Vienna to treat patients with nervous disorders. Freud coined the term “psychoanalysis” in 1896, claiming that dreams were the expression of unconscious conflicts of the mind. He encouraged his patients to free associate, unlocking painful memories that had been repressed since childhood. The basis of Freud’s theory of the unconscious was sexuality and the repression of sexual urges. His theory of human development established the irrational as a driving force of the human mind. Early critics of Freud’s theory of the unconscious were threatened by the theory’s potential for individual self-discovery, which could undermine the traditional moral codes of church and state.

Freud had been introduced to the American psychiatric community when he visited Clark University in 1909. Even though Freud’s theories were referred to in discussions and publications of the American psychiatric community by the early 1910s, only a few professional psychiatrists used psychoanalysis in private practices. In general, Freud gained influence when psychiatrists achieved professional dominance over psychologists in the 1920s. While psychiatrists had gained an institutional foothold in diagnostic and treatment programs in the United States, psychologists had been relegated to the role of “mere” intelligence testers.

By the 1920s, mainstream psychiatry in the United States had become accustomed to psychoanalysis and had refashioned it into a peculiarly American form. Finding Freud’s theories to be too deterministic, many in the field of dynamic psychiatry, or adjustment psychiatry, rejected them. American psychiatrists in psychopathic hospitals retained part of Freud’s methods that linked with the theory of the unconscious, namely the psychiatric analysis of a patient’s confession of disclosure of intensely private information.

Psychiatrists adjusted their theories to the sexual revolution that had reached the working and middle classes in the United States. For example, sexologist HAVELOCK ELLIS popularized a new standard of sexual morality in

his book, *Psychology of Sex*, which recorded and classified forms of human sexual desire. Under the new sexual mores, women who had been labeled “hypersexual” before the 1920s became normal, as long as their sexual behavior was confined to heterosexual marriage. Psychiatrists diverted their attention from hypersexual working-class women to sexual psychopaths, who were most often male homosexuals, who were labeled as rapists, child molesters, or sex offenders.

Significant differences distinguished European psychiatry and psychology from the American traditions. Freud had blurred the distinction between the normal and abnormal, which was a stark separation that had characterized much of the thinking about human beings in the 19th century. In contrast, American psychiatrists lacked skepticism, often promoting presumptions about what was normal for humans, especially when it came to sexuality.

Freud had a significant influence on the psychiatric profession, bringing the new science of psychoanalysis to the United States. Although Freudian psychoanalysis merged with the modern treatment models of psychiatry, significant differences between the European and American professions remained.

## Fuel Administration

The Lever Food and Fuel Act of August 10, 1917, established the Fuel Administration as an agency to coordinate the production, supply, and distribution of vital resources of gasoline and oil. Once the United States had entered WORLD WAR I in April of that year, President WOODROW WILSON’s administration began its preparations. Ensuring a sufficient supply of goods and resources was essential. The administration created the COMMITTEE FOR PUBLIC INFORMATION in April 1917 to begin preparing the public for the sacrifices they would be asked to make. The administration created the WAR INDUSTRIES BOARD and the NATIONAL WAR LABOR BOARD to oversee war production and labor disputes, and it secured passage of the ESPIONAGE ACT and the SEDITION ACT to ensure public support for the war. In addition, consumers were encouraged to ration food and conserve the products they used.

One of the products increasing in public demand was oil and its by-products, particularly gasoline. The growth of both consumer and defense industries, along with the expansion of automobile ownership, meant oil, coal, and gasoline were in high demand. Waging a modern war meant the supervision and, if need arose, rationing of fuel. Wilson created the Fuel Administration in August 1917 and appointed Harry A. Garfield to oversee its operation. The Fuel Administration asked the public to voluntarily conserve coal and oil by driving less, using less coal to heat their homes, and restricting nonessential consumption. It fixed the price of coal higher to bring less efficient coal mines into operation and increased coal production by 50 percent. It also had the power to ration supplies of coal and oil.

In the winter of 1917–18, heavy demands on the fuel supply led to a coal shortage across the United States. Coal trains were stopped en route, and towns appropriated coal supplies. Police had to safeguard coal stockpiles, and industries vital to defense, including armaments and shipbuilding, ground to a halt. Fuel administrator Garfield shut down factories east of the Mississippi for four days in order to ensure coal deliveries to ships headed for France. After January, however, the shortage began to ease. There were few problems for the rest of the war.

Labor problems, though, loomed on the horizon. The UNITED MINE WORKERS OF AMERICA (UMWA) had signed a no-strike pledge, known as the Washington Agreement, with the Fuel Administration. Bituminous coal miners received no raise under the agreement, and wartime inflation eroded the purchasing power of their wages. The agreement, which did not expire at war’s end in November 1918, held the miners in check for nearly a year, but by September of 1919, the UMWA actively sought increases from mine operators. The mine owners refused to budge, and the UMWA set a strike deadline of November 1, 1919. When Attorney General A. MITCHELL PALMER advised the UMWA of the consequences of disregarding the Washington Agreement, the union president backed down. The miners did not go back until a few days later, when they received a 12 percent wage increase. A subsequent mining commission found that real wages for miners had lagged behind inflation, and they granted a 27 percent wage hike for all miners. By the time of the settlement, the wartime Fuel Administration had already been disbanded, having closed its doors in June 1919.

**Garvey, Marcus** (1887–1940) *black nationalist leader*  
The leader of the first black nationalist movement in the United States, Marcus Garvey tried to establish a separate black-governed country in Africa. He ultimately failed, but his efforts to create a black-run economy in the United States and his appeals to black pride made him one of the most important African-American leaders of the early 20th century.

Born in 1887 in Jamaica, Garvey founded the UNIVERSAL NEGRO IMPROVEMENT ASSOCIATION (UNIA) in 1914. The initial platform for the UNIA called for caring for the needy of the race, civilizing backward African people, and developing schools and colleges for African and African-American youths that would teach a commitment to racial brotherhood around the globe. In addition, it called for the establishment of agencies around the world to protect the rights of blacks and for the creation of commercial and industrial trade between blacks. Garvey was not very successful in his first two years. The organization had only 200 members in 1916. In March of that year, Garvey toured the United States to raise funds for UNIA. During his tour, he was impressed by the condition of African Americans in relation to those faced by Africans in Jamaica. He hoped that the relative wealth of the African-American community in America and the existence of black leadership would help his organization. He decided to move UNIA's headquarters to Harlem in New York City.

UNIA enjoyed a measure of success in the years following its move to the United States. Answering Garvey's own call for the establishment of black-owned businesses, UNIA bought its own building in Harlem, opened a restaurant, began a newspaper, the *Negro World*, and established a steamship line, the Black Star Line. The Black Star Line was the most visible manifestation of Garvey's philosophy. The black-owned and operated Black Star Line would not only carry black immigrants to Africa but would also foster trade among blacks in the United States, the Caribbean, and Africa. According to Garvey, this trade would form the

basis of the worldwide black economy of the future. UNIA raised the money needed to buy steamships by selling stock in the Black Star Line. African Americans embraced the idea, and UNIA had no trouble selling the stock.

Garvey reached the peak of his power in 1920, when UNIA held its first international convention in Madison Square Garden. For one month, 25,000 delegates met to establish it as an international organization. The convention elected Garvey as the provisional president of Africa and

Marcus Garvey (Library of Congress)

approved a 54-article *Declaration of Negro Rights*, which called for equal rights for Africans throughout the world. It named injustices suffered and demanded equal treatment before the law, access to economic opportunity for blacks, an end to colonialism, the return of Africa to African rule, and also adopted an African national anthem.
